REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

THURSDAY, MARCH 8, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, DC.

The subcommittee met, pursuant to notice, at 2 p.m., in room 2167, Rayburn House Office Building, Hon. Norman Y. Mineta (chairman of the subcommittee) presiding.

Mr. MINETA. The Subcommittee on Surface Transportation will please come to order.

This is a rapidly changing world. In recent events in Europe and elsewhere, if anything, it should teach us the lesson that this is an age for truth.

The truth is that the challenges facing the United States today rest more here at home than they do anywhere else. Today, I look at the state of our highways and mass transit systems, and I see these challenges. I also see the great promise of the United States of America.

Nineteen months from now, on September 30, 1991, our current five-year program of highway and mass transit assistance will expire.

We will have four million miles of highways and 438 transit systems in the United States by then. What will we do with them?

How will we use them to benefit the American people and to enhance the economic power we have here at home and, more importantly, throughout the world?

That's what we will need to decide during the next year and a half. In the past, some have chosen to view our transportation programs as a collection of individualized concerns. But, I strongly believe that we must look at our Federal transportation programs from a broader perspective.

I believe that we must define our efforts in terms of domestic economic development, our international competitiveness, public safety, quality of life, and a stable, consistent funding source.

Thirty-five years ago when President Eisenhower launched the Interstate Highway Program, military defense was a main concern.

Today, it is our economy which faces the most serious threat. We know that the costs of meeting our transportation needs will be substantial, but think of the price the United States has paid for being penny wise and dollar foolish in recent years.

Today, half our bridges are deficient. In the last ten years, urban congestion has increased by 50 percent. In the next ten years, 25 percent of our roadways are going to have to be resurfaced.

The simple truth is this. We must make investing in our transportation network a top National priority. There have been many recommendations made regarding the future of federal highway and mass transit assistance programs. But beauty is, after all, in the eye of the beholder.

A city public works director will view a good transportation program from one perspective. A local transit agency chief may see it another way.

A state transportation head may still see it another way. This is one reason why we have awaited the U.S. Department of Transportation's National Transportation Strategy to help answer questions and offer a sense of direction.

Our transportation network is the most expansive in the world, and it is also the most fragile. But being the biggest, in this instance, does not mean we're the best. We should be the best, and we should settle for nothing less.

Studies call for transportation investments of up to $3 trillion during the next 20 years. There are no more universal truths than these.

How we spend the money is as important as, if not more important than, how much money we have to spend. How we preserve and expand our transportation network has the potential to either make or break the U.S. economy in the years ahead, not to mention the air we breathe and our overall quality of life.

President Bush says he wants a kinder, gentler Nation, and that's nice, we all do. But you can't get from here to there unless you've got the roads and the bridges and the rail systems to move people and goods.

There must be money and purpose to match the words. The president's fiscal year 1991 budget provides neither. In fact, his budget slashes existing programs, falling way short on foresight and continues to bottle up billions of transportation trust fund dollars in OMB's version of a Swiss bank account, and that must stop.

Underfunding highway and mass transit programs may have made sense to some in the past for the sake of short term fiscal relief.

Underfunding in the future, however, could mean economic suicide in a new world in which butter, not guns, is the preferred commodity.

So the next few months, the Subcommittee on Surface Transportation will seek to determine how we can best prepare for the transportation challenges of the next century.

We can afford to do nothing less. So I look forward to working with my colleagues on this subcommittee, the full Committee on Public Works and Transportation, and with the Department of Transportation and its very fine Secretary of Transportation, Sam Skinner, to meet that responsibility.

We're fortunate to have a Secretary with vision, commitment, and a willingness to work together to fashion a good National Transportation Program.

So I look forward to his being here today as he unfolds his new program that was announced by the President this morning at 11:30.

Now I yield to my very fine colleague and working partner in this effort, Congressman Bud Shuster, of Pennsylvania.

Bud.

Mr. SHUSTER. Thank you very much, Mr. Chairman.

I certainly want to welcome you, Mr. Secretary, and your key advisors and helpers before the committee today. I want to congratulate you on the transportation policy statement which you have released today.

I think it is an excellent first step. It defines the needs for this country, it clearly indicates that, regardless of whose projections we take, our essential needs exceed the funds which are available, and indeed you put forward some very innovative ideas and thoughts.

The idea of expanding the toll roads, something which, in the 1987 Act, I was the author of the provision that provided for some pilot toll road projects, and now you're proposing that we go much further with this, and I think that is a big step in the right direction.

Also, you're focusing on the excellent concept of thinking in terms of matching funds not only in terms of States matching Federal dollars, but also in terms of tapping that tremendous reservoir of private investment which is out there, an idea which is exciting and an idea which can stimulate and accelerate the construction of new transportation systems by bringing the private sector into it and making them a full-fledged partner.

So I think that, too, is a very, very significant proposal in your policy. There are those who seem to want to criticize your policy statement even before it's off the press, those who claim, for example, that because it does not propose spending more Federal dollars, it must somehow be lacking.

But it seems to me that you are keeping the horse in front of the cart, as you should, in the policy which you have proposed today.

Starting out by talking in terms of spending more federal dollars is exactly the wrong thing to do. Our starting point should more properly be, as you have proposed, getting more bang for the buck, getting more dollars utilization, both in terms of innovative funding, and certainly I was pleased to see also that you emphasized in your report the absolute importance of preserving the integrity of those trust funds.

I would go a step further and say that I think one of the first things we've got to do is take the trust funds off the budget, and we've got to recognize that even though there are obligations on the books which exceed the surpluses in the current trust funds, we, of course, know that that's not the way you measure it.

You measure it by looking at what the flow of cash is going to be into the trust funds over many years, so I think that your approach is exactly as it should be with regard to the question of more federal dollars.

That's not the first thing we should talk about; if necessary, it's one of the last things we should talk about. If indeed there is a need for increased federal user fees in the future, then so be it.

We should address that issue at the proper time. In fact, when we call for the States increasing their participation, it seems to me that one of the ways we may best be able to get them to increase their participation is by us increasing our participation as well.

But I think that's a future battle, not the first thing that we should be talking about. We should be doing these other constructive proposals which you make, and I salute you and certainly Dr. Larson, Mr. Clymer, Mr. Curry, all of you for your efforts in this regard.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Bud.

Now I would like to call on the very fine Chairman of the full Committee on Public Works, the gentleman from California, Congressman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman.

I want to congratulate you and the subcommittee for starting this series of hearings to develop a comprehensive and all-encompassing look at the nation's transportation programs.

It's very important that we have that record as we begin the reauthorization process. The last two times that the Highway Trust Fund Programs were reauthorized, I sat in your seat.

Mr. Chairman, one of the things I learned during those processes was how carefully the very wise advice of the full committee Chairman, and I hope it continues that way, who formerly Chaired the Subcommittee on Surface Transportation, should be followed.

I also learned that the effort you are embarking upon will be among the most challenging, rewarding, and frankly fun work that you will do as Chairman of this subcommittee.

I also want to join in welcoming Secretary Sam Skinner to our hearings and to thank you, Mr. Secretary, for being here to get us started on the reauthorization process.

I think this is our third or fourth meeting, I believe, in the last two days, maybe five, on different issues, but it shows how important these transportation issues are.

I'm glad that all of us, the committee, the Department of Transportation, are all working toward the same goal of a better transportation system.

Your release of the department's policy statement comes at a significant time for us. We are nearing completion of the Interstate Highway System, and that gives us the opportunity to take a new look at the federal policies which will take our highway and perhaps the programs into the 21st century.

We face a growing transportation crisis in this country, there is increasing traffic and congestion on a highway system that is crumbling, and we must upgrade and repair our existing systems while meeting our growing transportation capacity needs.

Possibly, our most important goal will be developing a transportation system that can cope with the massive growth in suburban travel.

Not everyone wants to go downtown anymore, there's a growing trend toward travel between two suburban points rather than a suburb and central city.

Much of this travel takes place in congested conditions, so we must develop a program to meet the needs of suburban travelers.

At the same time, any program we develop must be consistent with the very important environmental concerns that we face, especially in the field of clean air.

In that regard, Mr. Secretary, I have some concerns about your policy statement that I would like to express now and get into further when we get down to questioning.

First, I don't understand how a national transportation policy can downplay the role of mass transit to the extent that I feel yours does.

To me, transit must be a vital component in the development of comprehensive, efficient, and environmentally sensitive transportation systems, and I see very little in your policy statement to make me believe that we are developing a national policy on mass transit that would result in anything more in the future but fare increases and service reductions.

Developing a national policy on mass transit requires forthright and bold leadership, and the development of these systems is a problem that must be approached from the National perspective, much as the Interstate Highway Program was in the mid-1950s.

Your policy I don't believe provides that leadership. Second, I see no assurance in your policy statement that we can expect the spending of the balances in the trust funds.

The fiscal year 1991 budget cites an uncommitted balance in the Highway Trust Fund of $19 billion. This money has been paid by the American highway users in the expectation that it will be used for transportation purposes.

We are deceiving them by not spending the money for highways and transit, despite the staggering needs which exist.

The transportation policy also does nothing to convince me that the deception of the American taxpayer that has been continuing for years will stop.

It does nothing to show me a recognition that the Nation is facing a growing transportation crisis. We have this money available in the trust funds ready to be spent to meet this crisis, and that action alone would do more for our transportation problems than any other piece of paper.

It's impossible to disagree with a goal of developing a better transportation system. When I come to the crunch of making a National commitment to invest in our future, the report, I feel, is lacking.

The resources are already in place to start making that investment by spending the trust fund balances. I think we should start that effort as soon as possible, and taking the trust fund balances off the budget is a step in that direction.

But I think we must spend that money. I hope that when we move beyond the general statements in the policy to more specifics that you'll be able to give us a little more assurance on what we would do with these trust funds.

I won't take any more of the subcommittee's time at this point. I want to thank you, Mr. Chairman.

I do want to congratulate the Secretary and, again, the President today for calling the meetings that we've had to help us bring these problems before us.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Anderson.

I'd like to call on the ranking Republican on the full Committee on Public Works and Transportation, the very fine gentleman from Arkansas, Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Chairman.

Mr. Chairman, I would like to join the Chairman of the full committee, Mr. Anderson, in commending you and Mr. Shuster for scheduling these five days of hearings to look at reauthorization of the Federal Highway and Mass Transit Program.

You know, this subcommittee has a great challenge, it has a great responsibility, it also has a great opportunity before it.

With the interstate system nearing completion, we can take a fresh look at fundamental elements of our Surface Transportation Programs that have been in place over three decades.

We have a lot of experience to build on there, and we can take steps to prepare for the future. The decision we make in this authorization process could influence our Nation's mobility well into the next century.

I would just comment on the trust funds. We do want to spend them down, but it isn't entirely the Executive Branch's fault, because if you remember, it is the Congress, the Appropriations Committee, that puts a ceiling, a cap, on those trust funds.

So there's enough blame to go around on why we aren't spending that money, and I would remind our colleagues that we have to look at our own operation as well as look downtown.

I do want to extend a warm welcome to you this afternoon, Secretary Skinner, and thank you for appearing before this subcommittee today.

As the Chairman said, you're the most energetic Secretary we've had around here in I don't know when. We've had five meetings since yesterday, and we appreciate you being at the fifth one.

But your efforts to stress the importance of transportation issues with the public and with President Bush have been highly successful.

It is clear that if we are to thrive in this competitive global economy of the future, the efficiency of our national transportation system will be critical.

Like many others, I had been eagerly awaiting your National Transportation Strategy, and I look forward to hearing your recommendations.

Thank you.

Mr. MINETA. I thank the gentleman from Arkansas.

Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman.

I join in welcoming you to the subcommittee today, Mr. Secretary. I want to especially thank you for the visit to my home State of West Virginia you made back in January in which you presented to our State a big, flat piece of cardboard, and it happened to represent a commitment to our infrastructure needs in West Virginia. Governor Caperton and Senator Robert Byrd, the Mayor of Huntington, and I were most delighted and appreciative of your efforts to help us complete that bridge going across Sixth Street into the State of Ohio from my home state.

I appreciate you taking the time to be with us in West Virginia. I do not plan on criticizing what was just announced today, but rather to make a few comments on what has already been in the public arena and what has already been addressed by both yourself and the President via his budget recommendations.

There's no question that we have to act, and we have to act quickly to address our infrastructure problems if we are to remain competitive in the world market place.

Although I could go through the figures of showing the need for infrastructure improvements, decaying bridges, roads in need of repair, et cetera, et cetera, I do not intend to do that this afternoon.

But the big question is what price do we pay in loss of productivity? I think there's no question that that price tag is huge.

The loss is astounding in terms of our productivity in this country. In the remarks you made before the Transportation and Research Board, you stated, and I quote,

> In the face of expanding international competition, we no longer can take transportation for granted. We need to maintain, expand and make our transportation system more productive. As a society, we should realize that when we invest in infrastructure, we not only increase productivity, efficiency and American competitiveness, but we also attract additional investment from the private sector.

I could not agree with these statements more. These are excellent sentiments; however, I think it is important that we also look at the facts that have been presented to us in the President's budget and make sure that those facts square with these sentiments that you have expressed.

That's where my big concern lies. For example, Amtrak funding is reduced from $646 million to zero; UMTA from $1.8 billion to $1.4 billion; essential air service, so important to my home State of West Virginia, is reduced from $30.6 million to $23.6 million; ARC is in for a big reduction.

We could go on and on and on down the list of these reductions in programs that don't seem to square with the statements that you have made.

We need to address our infrastructure needs, and we need to do it through financial commitment. That, like my other colleagues on this committee, is what I want to see take place.

Of course, we want to get more bang for our buck. That's a very worthy position to take. But at the same time, I think we have to stop chasing the most esoteric and costly defense systems, and we have to put those monies toward our infrastructure needs in this country.

We have to put them toward the future of this country, and that is right here at home. We must realize that we're no longer fighting a military war, we're fighting an economic war. Our threat is not communism, our threat is competition.

In that regard, I stand ready to work with you to ensure that our front line of defense, a sound infrastructure, is indeed provided for in our budget.

Thank you, Mr. Chairman.

[Mr. Rahall's prepared statement follows:]

STATEMENT OF HON. NICK J. RAHALL

There can be no question that we must act quickly to address our infrastructure problems if we are to remain competitive in the world marketplace. According to recent figures, it is estimated that more than 62% of paved roads in the U.S. are in need of repair, over 220,000 of the Nation's 575,000 bridges are either structurally deficient or functionally obsolete, and that some 30% of the bridges over 20 feet long are at least 50 years old, which is the average life-span of a bridge.

The price we pay in loss of productivity is astounding. It is estimated that the added cost of driving on bad roads is approximately $16.2 billion, or $99.60 per driver, and that we waste about 1.25 billion vehicle hours and 1.38 billion gallons of gasoline in traffic congestion on limited access highways per year. This is expected to increase to 6.9 billion hours and 7.32 billion gallons of gasoline by the year 2005.

In remarks made before the Transportation Research Board, Secretary Skinner said:

"In the face of . . . expanding international competition, we no longer can take transportation for granted. We need to maintain, expand, and make our transportation system more productive. . . . As a society, we should realize that when we invest in infrastructure, we not only increase productivity, efficiency, and American competitiveness, but we also attract additional investment from the private sector."

I could not agree more with these sentiments. Yet the President's budget request would reduce Amtrak funding from $646 million to $0, UMTA funding from $1.8 billion to $1.4 billion, the Essential Air Service from $30.6 million to $23.6 million, the Appalachian Regional Commission from $147.9 million to $50 million, and the list goes on. I do not see how we will address our infrastructure needs by decreasing our financial commitment.

Based upon how the President's Transportation policy has been described so far, I see only a continuation of this trend. Of most concern to me is the following statement made in an executive summary of the National Transportation Policy:

"Above all, it [the National Transportation Policy] embodies the ongoing shift from a heavy-handed Federal role to greater flexibility for and reliance on State, local, and private sector initiatives and resources."

This says to me quite simply, "yes we have transportation problems, let the states deal with it, the federal government does not have the money." As a representative from West Virginia, I can tell you that the States cannot deal with it, they do not have the money either, and they both need and welcome federal funds.

Mr. Chairman. This is not only a crisis for my state, it is a national priority. Are we to throw up our hands to the heavens every time we face a national need and turn our backs on the American people? West Virginians say no, I say no, and I hope our committee and this Congress will say no. It is time we faced our responsibilities to the country again.

If we are really serious about addressing our infrastructure problem, we will have to reorder our nation's priorities. We will have to stop chasing the most esoteric and costly defensive systems and put the money towards addressing basic infrastructure needs. We must realize that we are no longer fighting a military war, we are fighting an economic war. Our threat is not communism, it is competition. Our front line of defense is a sound, efficient infrastructure.

Mr. MINETA. Thank you very much.

Mr. Packard.

Mr. PACKARD. Thank you, Mr. Chairman. The last 35 years, the building of the interstate plan or fulfilling of the interstate plan has been a remarkable achievement, and it's certainly put this country in the forefront in terms of transportation and the movement of people and goods.

The next 30-year or so plan will become as critical to future of the country as what we have found the existing interstate plan has been in the past.

Certainly, the emphasis that you and the Administration is placing upon the development of such a plan is very heartening.

Those of us on the committee are very anxious to get deeply and quickly into the development of the new plan, and I know that you and your department, Mr. Secretary, are feeling the same.

I was particularly heartened to see your interest in the use of blending Government efforts with that of the private sector.

In California, where I've been working on transportation problems in the San Diego and Orange County areas, there is no question that we're moving in the direction of the private sector assisting us in doing what we cannot furnish all the funds to do publicly.

That's, I think, a move that we're going to have to incorporate into any plan that involves the long term future of transportation in this country.

The one disappointment, of course, and you're going to be hammered by almost all members of this committee on that obvious void, and that is the use of the trust funds to camouflage a deficit when they are so badly needed for transportation purposes.

I don't think any member of this committee is going to change their feeling on that, and we hope that you will recognize our feeling and work with us in helping to use those funds for the appropriate purposes.

Again, I'm so grateful that you're here and appreciate very much the work you've done in preparing us for moving into the new planning process.

Thank you very much, Mr. Chairman.

Mr. MINETA. Mr. Borski.

Mr. BORSKI. Thank you, Mr. Chairman.

Secretary Skinner, I also want to extend to you a warm welcome, and I want to give a particular warm welcome to Mr. Brian Clymer, the new Head of the Urban Mass Transit Administration. I believe this is his first time before our committee.

As a Philadelphian, I am very pleased that Mr. Clymer is heading up the federal agency which is responsible for our Nation's public transit policies.

Before coming to Washington, Mr. Clymer served many distinguished years as a member of the Board of Directors of SEPTA, Philadelphia's regional rail system.

He understands firsthand the importance of public transit and the challenges facing our Nation's transit system.

As one who believes that a strong public transit system is necessary to relieve traffic congestion, enhance U.S. competitiveness, and to improve our Nation's air quality, I must say, however, that I am somewhat disappointed and frustrated by what appears to be the Administration's policy of less aid to mass transportation throughout our country, and I look forward to your statements in questioning, sir.

Mr. MINETA. Thank you very much.

Mr. Grant.

Mr. GRANT. I have no opening statement, Mr. Chairman.

Mr. MINETA. Very well.

Mr. Payne.

Mr. PAYNE. Thank you very much, Mr. Chairman, and thank you for holding this hearing, the first in a series of hearings to begin the important process of reauthorizing the Federal-aid highway system.

Mr. Secretary, I certainly want to welcome you back here today and look forward very much to hearing your testimony.

I believe that we all share a deep concern for the condition of our Nation's infrastructure. I certainly know my fellow Virginians share that.

We have all seen and heard of roads that are falling apart, bridges that are on the verge of collapse, overcrowded highways, and other similar situations.

Our Nation's ability to grow and compete internationally is truly dependent on our ability to provide adequate and efficient modes of transportation, and we certainly need to examine how we maintain our current highway system, as well as upgrade and expand it.

Mr. Secretary, I want to commend you for holding the many meetings that you've held around the Nation in order to develop the national transportation policy, and while I have not yet had an opportunity to review this policy, I look forward to hearing your recommendations on the direction that our transportation network should follow into the next century.

Thank you.

Mr. MINETA. Thank you very much, Mr. Payne.

Mr. Hancock.

Mr. HANCOCK. I have no opening statement, sir.

Mr. MINETA. Very well.

Mr. Skaggs.

Mr. SKAGGS. Welcome, Mr. Secretary, gentlemen. I look forward to your testimony.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Thank you, Mr. Chairman.

I certainly greet the Secretary and certainly Tom Larson, who have made themselves very available to listen to ideas and to work with members of the Congress to try to put together a frame work for action.

I think there's a lot of insight in this plan. I commend you for the time and the work and the hearings and the drudgery that you went through to put this thing together and to listen to what people had to say.

I think that's certainly commendable, and I certainly agree with our minority leader, Mr. John Paul Hammerschmidt, and even the comments of Mr. Rahall, that says we need to have the sight to be able to prepare for the decade of the 1990s and the turn of the century when we need to be competitive and we need to be productive, because we're going to compete with the world, and we have to have the infrastructure there to do it.

So I commend you, and I'm looking forward to working with you. Of course, there are going to be adjustments as you go along on this thing, but we certainly appreciate your first effort.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. DeFazio.

Mr. DEFAZIO. Thank you, Mr. Chairman.

Mr. Chairman, usually I refrain from opening statements, but I have to partake of our air transportation system shortly, and I won't have an opportunity to hear the Secretary's testimony, but I'd like to raise a few questions.

I think, in reference to some of the earlier remarks, I think it would have been a good first step in dealing with the transporta-

tion needs of this country until apparently the idealogues at OMB and the White House managed to transmute gold, which is my understanding from press reports of your first draft, into lead with their final draft.

I think it's really vintage George Bush White House material. The Twinkie transportation policy; airy light, with nothing but fluff at the core, and I hope it will have a shorter shelf life.

At a time when our highways are crumbling, our bridges are collapsing, our airways are becoming congested, dangerously, the Administration's solution is disengage. Wash your hands of the mess. Call it a local problem.

It's revenue sharing in reverse, Mr. Secretary. The Federal Government sucks up all the money, we even increase what we're taking for air transit, and we send the bills back to the States.

To deal with our infrastructure, we need vision, boldness, and commitment, not buck passing or timidity. For more than a decade, we've been underinvesting.

The Reagan Administration produced a report that showed us the tremendous needs of the next 20 years, half the bridges in the country need serious repair, close to a million miles of highway need resurfacing, in my home State of Oregon, we identified more than a billion dollars in highway projects for which there isn't money, and we're raising our own gas tax annually for the next ten years to pay for it. The neglect is haunting us in terms of productivity and competitiveness.

Fifty-four nations around the world spend more as a percentage of GNP on infrastructure than the United States. Japan spends five times what we do.

Mr. Skinner, I believe you are committed to dealing with our infrastructure. I believe you would like to see the Administration put forth an honest and responsible infrastructure plan.

I would like to ask you to provide us with the uncensored version of the plan, the plan before OMB and Mr. Sununu got through with it, and I'd like you to compare and contrast the two plans and enlighten this committee about the process the document went through and the policy recommendations in the report which did not originate within your department, and suggestions that OMB may have made which were adopted in your final report.

I believe that the committee could then act to provide honestly for the infrastructure needs of this country, but, unfortunately, this banned in Boston version is not going to do that for us.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Valentine.

Mr. VALENTINE. No opening statement, Mr. Chairman.

Mr. MINETA. Mr. Bosco.

Mr. BOSCO. No opening statement, Mr. Chairman.

Mr. MINETA. Mr. Visclosky.

Mr. VISCLOSKY. No opening statement, Mr. Chairman.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Mr. Chairman, I have a unanimous consent request, but before I make it, I'd like to point out to my good friend from Oregon that it was the Reagan Administration in 1982 which provided the last very substantial increase in funding for transportation, in fact, an increase of about 40 percent.

So the gentleman really doesn't have his facts right, and further I would point out, and even more to the point, that three times in the past two years we've had the opportunity in the Congress to take the aviation or highway trust funds off budget, and in each three of those votes, the Republican members of the House voted overwhelmingly in favor of taking those trust funds off budget so they could be spent, and the Democratic members of the House voted overwhelmingly against taking those funds off budget.

Beyond that, all four of the Democratic leadership, Foley, Gephardt, Gray and Hoyer, voted against taking those trust funds off budget.

So I'm sorry my friend from Oregon felt the need to try to make this so partisan, but since he has, I think it's important that we get the facts on the record.

Mr. DEFAZIO. Would the gentleman yield?

Mr. SHUSTER. With that——

Mr. DEFAZIO. Would the gentleman yield?

Mr. SHUSTER. No, I would not.

With that, I would ask unanimous consent that the statement of all I'm saying would be put in the record.

Mr. MINETA. Without objection, so ordered.

Mr. Secretary, we're pleased to have you here so soon after today's announcement of this policy, and we appreciate your clearing your schedule to do this, and so a copy of your statement is before us, and it will be made part of the record.

So if you would go ahead and proceed in your own fashion and introduce your colleagues. Thank you very much, Mr. Secretary, again, for your being here. We really do appreciate it.

TESTIMONY OF HON. SAMUEL K. SKINNER, SECRETARY OF TRANSPORTATION, ACCOMPANIED BY THOMAS D. LARSON, ADMINISTRATOR, FEDERAL HIGHWAY ADMINISTRATION; JERRY RALPH CURRY, ADMINISTRATOR, NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION; AND BRIAN W. CLYMER, ADMINISTRATOR, URBAN MASS TRANSPORTATION ADMINISTRATION

Secretary SKINNER. Thank you, Mr. Chairman.

I am delighted to be here with my own version of Denver's three amigos, General Curry, the NHTSA Administrator; Brian Clymer, who we now know, as I knew all along, but I'm glad the world knows, is our very able UMTA Administrator; and Dr. Larson, the former Secretary of Transportation from the State of Pennsylvania, who was former President of the Transportation Research Institute and one of the leading policy scholars in transportation in the Nation. He serves not only as the Federal Highway Administrator, but is the able Co-Chair of the National Transportation Policy Working Group.

I think if anyone reflects on what's happened the last few days, one must acknowledge that we have begun the debate on surface transportation and all modes of transportation as we move into the next decade.

If the National Transportation Policy does nothing else, and it does much more, than heighten America's awareness of our transportation needs and bring forth new and creative ideas for Congres-

sional review that will shape the form of our transportation system in the next century, I think it will have served its purpose.

But it does and goes far beyond that, and I'd like to talk a little bit about what it is. First of all, as everybody knows, the National Transportation Policy is the first such policy since 1978.

I was interested to see that the press has called it the long-awaited National Transportation Policy. The National Transportation Policy process began when Dr. Larson was sworn in and came down to Washington the end of April 1989, was completed at the end of the year with relatively minor changes at OMB, most of which we not only accepted, but thought were reasoned suggestions, and is actually announced today.

That's about an eight-month process to develop a strategic plan for transportation in this country, and I want to say that I think that's a direct result of a phenomenal effort by Dr. Larson and his staff, the Deputy Secretary and everybody that's worked on it all over the country.

One of the biggest frustrations in policy planning in Government, I am told by those with greater institutional knowledge than I have, is that it takes years just to get to the policy, and by the time the policy is complete, the reauthorizations have already been done, the Secretary is ready to leave, it goes on the shelf, and we begin the process all over again.

This plan has been completed in the first year of an Administration. It's one of the President's first management by objective goals that's been completed. We have the benefit of the policy for the next several years as we move forward into the areas of highway and aviation reauthorization.

Let me also say that this is a policy of the people. It's a policy that was developed after over 100 sessions held all over this country. People have been heard from on all aspects of the policy in all parts of this country.

I think it represents their feelings, their sentiments, and their suggestions, as well as identifies their problems, in addition to those that have been identified here in Washington.

Finally, let me say that I think it's a system that clearly requires and identifies the need for us to invest in America.

It brings home clearly the point that an investment in transportation is an investment in transportation infrastructure and an investment in America's future, and it is absolutely essential if we're going to remain competitive.

I think it talks about things that we all know must be done with limited resources. In all situations like this, we always have less resources than we require.

It focuses on systems of national significance and promotes national priorities. It talks about ways to improve mobility, not only in the existing system, but in the future.

It talks about how to efficiently move goods and provide jobs and improve the quality of life. It is intermodal in nature.

For the first time, the Department of Transportation and the various modal administrators have worked together in developing a policy, have been all over the country together, and have developed a synergy in a relationship that will be ongoing as we complete the

initial phase of developing the policy and now begin its implementation.

Finally, it addresses six major themes. One, maintaining and expanding the existing transportation system; two, providing a sound financial base for transportation programs; three, maintaining a strong and competitive transportation industry; four, ensuring public safety and national security; five, enhancing the environment and the quality of life; and six, it talks about—and this year's budget makes a substantial contribution in the funding for—advanced transportation technology, which is absolutely essential if we're going to compete in the world market.

The policy gives us the long term vision for the future and a short term decision making matrix for major initiatives. Let me give you some examples.

Soon, we will be forwarding to the Congress the FAA's reauthorization bill. This bill going before another subcommittee of this committee will include an increase of more than 70 percent to the Federal Aviation Administration's capital and research and development programs over the next five years as compared to the last five.

It also calls for a provision allowing local airports to levy a passenger facility charge to support airport development.

And, yes, we are proposing an increase in aviation user fees to support these increased levels of Federal spending on aviation infrastructure.

The Congress' willingness to enact such an increase will be an important demonstration of our Nation's leadership and the fact that we are committed to meeting the department's and the Nation's transportation infrastructure needs.

I would suggest that the American people's acceptance, reflected in public opinion polls, of user fees for transportation is quite clear. This was clearly demonstrated two weeks ago when the new toll highway authority was opened in northern Illinois, and where the volume on that new toll highway was substantially greater from day one than was expected. People are moving and products are moving faster and more efficiently than they have for years.

I might also suggest that as we move forward in implementing the National Transportation Policy, it gives us a good basis for reauthorization of the Highway Transit and Highway Safety Programs.

It frames the issues, it suggests some solutions and some very, what I consider, creative approaches to maximizing the dollars, and, yes, it does call for a greater local role.

It calls for a greater local role without diminishing the Federal role, and, in many cases, calling for a substantially greater Federal role.

With that goes greater flexibility. If one looks at the facts, they will see that the flexibility that exists in this program is much greater than the States have ever had before, and it is something that they have been asking for for many years.

The policy will serve as an umbrella for such things as the Highway Traffic Safety Summit that will be conducted in the Midwest in April and the oil spill initiatives to protect the environment and

prevent another disaster like the Exxon Valdez, that are before the Congress right now.

It calls for, as does the budget, a 17 percent increase in fiscal year 1991 for advanced research in such areas as MAGLEV, as well as intelligent vehicles and highways.

Finally, we have adopted, as part of this overall strategy to make ourselves competitive, a program that will enable foreign air carriers to provide improved international service to more cities than ever before.

Open skies for aviation is absolutely essential. For anyone to say that the National Transportation Policy is not specific is an indication that these people have not read the 169 guidelines and 65 legislative objectives in the Policy. These are long term goals that are needed to help preserve transportation facilities currently in place, expand essential capacity, close the gaps, and promote effective connections between the rural and urban Americas.

It is the beginning of what, as Chairman Anderson said, should be a very, very exciting adventure. One can approach this process with trepidation or with excitement and enthusiasm.

From my many discussions with members of this committee, with discussions with people in the industry that will be affected by the reauthorization process, as well as with discussions with my own people, I think it is clear that everyone, with rare exception, is looking forward to the process that begins today with a great deal of enthusiasm, a great deal of excitement, and when we're done, hopefully a great deal of satisfaction.

With that, I would ask that my formal remarks be made part of the record. Because there are so many members present who have so many areas that they're interested in, I would suggest that along with the three amigos, we will take questions from the Chairman and the rest of the members of the committee, as appropriate.

I would only have one final caveat: the easy questions are mine, the hard ones go to them.

Mr. MINETA. Thank you very much, Mr. Secretary.

As the Congress proceeds with the reauthorization of the Post Interstate Surface Transportation Programs, a major element of the programs will focus on preservation of the existing Federal investment in our highway and mass transit systems.

I'm wondering does the National Transportation Policy envision the use of Federal funds for highway and transit capital, maintenance and operating costs?

Secretary SKINNER. On highways of national significance as defined by the reauthorization process? The answer is clearly yes.

The amount of the Federal role as compared to the amount of the State role on what I consider to be very urban areas of joint interest, I think we're going to suggest some significant changes because we think that those arteries serve many purposes, and there are many very, very exciting, creative, and actually very practical funding solutions that can help fund some of those, making funds available for other areas in highways of national significance.

Mr. MINETA. Are there any other areas, other than highways of national significance, where maintenance requirements may be imposed or mandated?

38-253 O—91——2

Secretary SKINNER. Dr. Larson, do you want to address that? We have not. I would say that now that the National Transportation Policy has been completed, we are in the process of developing a very extensive package for reauthorization.

As I've indicated to you, Chairman Mineta, that has not yet reached my desk nor the Office of Management and Budget, so you'll forgive us if we talk in concepts rather than in specifics, because we don't want to get out in front of the Administration.

Mr. MINETA. I understand.

Dr. Larson.

Mr. LARSON. Chairman Mineta, the concern for better managing what we have and maintaining it is a top priority. It's spelled out clearly in the policy document.

We envision expecting the States to use some of the new technology, some of the new management systems, as we go forward.

So the answer basically is yes, we are moving in that direction.

Mr. MINETA. Private sector investment levels are often based on tax policies, and in this policy we're looking hopefully to a great deal of private sector investment.

However, the uncertainty about future tax treatment makes long-term investments very difficult, those decisions that are related to long-term investments.

So how will the National Transportation Policy encourage the private sector to commit to long-term investments for the construction of major infrastructure improvements?

Secretary SKINNER. Well, basically, it will create flexibility within the statute that will allow States to pool funds and to designate roads that heretofore would not be available for toll or a combination of toll and Federal-aid funding.

That flexibility in and of itself will guarantee, in the case of the marketplace, an income stream that clearly will be sufficient.

The real key is not so much the tax treatment as much as it is the certainty of the income stream.

We will allow a much more flexible approach. We are hopeful, with your concurrence, that will allow the certainty of income stream which will allow the private sector to go to the marketplace and develop the capital necessary.

Mr. MINETA. So it's the attraction of the flexibility that will be encouraging the private sector to make these kinds of investments?

Secretary SKINNER. That's right. In the case of mass transit, Mr. Clymer may want to add a point or two, and, Dr. Larson, you may want to expand on highways.

Mr. CLYMER. Thank you, Mr. Chairman.

One of the things that we're looking at in the area of mass transit is perhaps eliminating some of the Federal barriers that exist and allowing a transit provider to function as a normal business entity.

There may be regulations that are more burdensome than they are beneficial, and if we can eliminate them and allow a transit provider to operate like a corporation would and provide some of its own transit benefits, without the use of Federal funds or public funds, then we feel that we should try to eliminate those barriers.

Mr. MINETA. There are certain areas in which maybe trying to add three or four more lanes of highways to an area won't do it.

We've got to get people from single occupant cars to car pools, van pools, and to transit. In the past, there has been some discussion about trying to change national tax policies to increase private sector involvement in highway and transit programs.

One of those specifically that was talked about was to provide, I believe it was called, a $15 per month employee tax benefit to cover ride sharing and transit uses.

Now, under this policy that you've issued today, given the sensitivity of the Administration about some of these tax issues, would we be precluded from considering tax initiatives? Are these ideas that would be entertained possibly as we go toward trying to develop legislation?

Secretary SKINNER. As you know, Congressman, the House Ways and Means Committee met yesterday on this very subject—I think it was yesterday—and took testimony on this.

The disparity between parking subsidies for surface transportation and mass transportation is very difficult for most people throughout this country to understand, and that is an issue that will be worked in the next several months through the Economic Policy Council to conclusion.

But I think at the same time we're working it through that policy process, the Congress will also be working it at the same time.

Mr. MINETA. Let me at this time call on our fine colleague from Arkansas, Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Mr. Chairman, I have no questions at this time.

Mr. MINETA. Then, Mr. Stangeland, would you wish to go ahead now?

Mr. STANGELAND. Thank you, Mr. Chairman.

Welcome, Mr. Skinner, and I apologize for not being here for your opening statement, but I had the call of 50 young students in my district, and they took priority over you today.

Let me say that I appreciate your work as Secretary, and I look forward to analyzing carefully your statement on your new policy.

There are things about it that I think are enlightening and exciting, and I think our dialogue will more appropriately probably be carried on as we work up a new surface bill in hearings later this year for the next Congress.

With that, Mr. Chairman, I would yield back and allow some of the other members the right to question.

[The prepared statement of Mr. Stangeland follows:]

STATEMENT OF HONORABLE ARLAN STANGELAND
HIGHWAY REAUTHORIZATION HEARING
SURFACE TRANSPORTATION SUBCOMMITTEE
MARCH 8, 1990

THANK YOU, MR. CHAIRMAN. TODAY'S SUBCOMMITTEE ACTION BEGINS A SERIES OF IMPORTANT HEARINGS ON REAUTHORIZATION OF THE NATION'S HIGHWAY, MASS TRANSIT, AND TRANSPORTATION SAFETY PROGRAMS.

IT SHOULD ALSO PROVIDE A FORUM FOR DISCUSSION OF THE DEPARTMENT OF TRANSPORTATION'S LONG-AWAITED TRANSPORTATION POLICY RELEASED THIS MORNING. THIS FAR-REACHING REPORT COVERS EVERYTHING FROM AVIATION TO MARINE SAFETY AND FROM MASS TRANSIT TO HIGHWAY MAINTENANCE.

ON THAT NOTE, LET ME JOIN OTHERS IN WELCOMING SECRETARY SKINNER. WE WERE MEETING JUST YESTERDAY IN AN EFFORT TO MAKE SOME PROGRESS ON THE OIL SPILL CONFERENCE. NOW THE FOCUS SHIFTS FROM JUST OIL SPILLS TO A BROAD NATIONAL TRANSPORTATION POLICY.

MY INTERESTS OBVIOUSLY GO BEYOND OIL SPILLS, AS WELL. THE TRANSPORTATION PLAN RAISES SOME IMPORTANT ISSUES -- PARTICULARLY THE INCREASED RESPONSIBILITIES OF STATE AND LOCAL GOVERNMENTS AND USERS TO FINANCE NEW AND IMPROVED TRANSIT AND INFRASTRUCTURE INITIATIVES.

THE FEDERAL GOVERNMENT SHOULD ENCOURAGE "INNOVATION" AND "FLEXIBILITY." AT THE SAME TIME, THIS COMMITTEE IS GOING TO CONTINUE TO URGE THAT WE USE THE TRANSPORTATION TRUST FUND SURPLUSES. CERTAINLY WE SHOULD LOOK TO THE TRUST FUNDS BEFORE INCREASING FEDERAL TAXES OR IMPOSING NEW "USER FEES."

MR. CHAIRMAN, I ALSO CONTINUE TO HAVE CONCERNS ABOUT NOT

MEETING THIS COUNTRY'S RURAL TRANSPORTATION NEEDS. THIS GOES BEYOND HIGHWAY MAINTENANCE AND SAFETY. IT INCLUDES AIRPORTS, TOO. WE NEED A STRONG ESSENTIAL AIR SERVICE PROGRAM AND AN EQUITABLE ALLOTMENT AND ENTITLEMENT FORMULA TO MEET SMALL AND RURAL AIRPORT NEEDS.

THANK YOU, MR. CHAIRMAN. I LOOK FORWARD TO REVIEWING THE TESTIMONY FROM OUR WITNESSES TODAY AND IN THE COMING WEEKS AND MONTHS.

Mr. MINETA. Mr. Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman.

I have a couple of questions. Mr. Secretary, my first is on private sector involvement. The National Transportation Policy envisions a significant increase in private sector involvement in transportation through ownership, operation of toll roads and bridges, as well as through the construction operation of public transit facilities and services.

Yet the private sector involvement may be limited only to the extent that the ownership and operation are profitable ventures.

If significant private sector involvement in the construction of transportation facilities and their operation does not materialize, will the public sector have the capability to address the Nation's tremendous transportation needs?

Secretary SKINNER. The answer is clearly that the solution to our Nation's infrastructure needs are a combination of all of the things that have been suggested.

The private sector cannot alone solve the problems, nor can, from what we have seen, the public sector. But operating in a joint State, local and private partnership, I think many of the problems that we face today can be resolved as we move into the next decade.

So nothing is being excluded. We're trying to expand horizons, rather than limit horizons.

Mr. ANDERSON. Is it wise to allow major public policy decisions, such as where a new highway is to be located, to be made by private individuals who may happen to be willing to put up the money for the project because doing so serves their private interests?

Shouldn't these decisions be driven by what's good for the public and not simply what is in the particular interest of the private party?

Secretary SKINNER. Well, I don't think anything we've envisioned here is going to allow a private developer to build a highway on what I call a willy-nilly basis.

Any of the projects that are ongoing right now have gone through State transportation departments and have been subject to a great deal of review by metropolitan planning organizations, and in many cases the legislative process at the State and local level.

So it was never envisioned that a developer could go out and build a road and put a toll booth at each end and get all the necessary State approvals without going through a State approval process, which I assume in all States would be based on reasonable approach to a very difficult problem.

Mr. ANDERSON. Also, one on intermodal access. Mr. Secretary, in past years, whether through legislation or other means, I've tried to focus attention upon and facilitate better intermodal transportation.

We need better access to our Nation's ports and airports, and we can have a wonderful airport to help move people and freight without delay or a tremendous port facility to help move cargo abroad.

But if you're in a traffic jam for an hour getting to that airport, or a truck is in a gridlock getting its goods to the port, you're still experiencing costly delays.

Now, America needs to be more productive and more competitive with our trading partners. So my question is do you feel as I do that there is a legitimate and very strong Federal interest in intermodal access, and if you do, what are you going to do to make sure that this Federal need is met?

Secretary SKINNER. The answer to the question is yes, and I'm going to let Dr. Larson expand a little bit on the some of the intermodal aspects that we think might be appropriate.

Mr. LARSON. Well, Mr. Chairman, the best example that I've seen recently is the Alameda Corridor in southern California where railroad packages are being combined, an improved highway is being provided, and grade separation is being provided so that we can move double-stacked trains directly from the ships out into mid-America and beyond.

So that's the kind of example that we need, and you're right, if you can't get to the airport, it doesn't really matter whether the plane is late or early.

So we do have to look at access, and I think that's happening. We're finding transit systems that are reaching out to airports.

I think in the future, we're going to see MAGLEV connections to wayports, which are airports built back away from the main line of the population, and I think there's a whole range of things that would suggest that intermodal connectivity is probably going to be the place where we'll find the best productivity improvements.

Mr. ANDERSON. Thank you, Mr. Secretary.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. Thank you very much, Mr. Chairman.

Mr. Secretary, thank you very much for being here on this very exciting day for the Department of Transportation and, I think, for the country.

What I have seen of the work product, I am very pleased with. I think it is, as you've indicated, the first step in what we hope will be an ongoing process.

The significant thing that needs to be noted is that unlike other transportation policies which are perhaps gathering dust somewhere in the archives of the Department of Transportation, this one comes early enough in the Administration so that we can really expect to see tangible results achieved from that.

I also want to note with pride as a Pennsylvanian that two of your colleagues there are fellow Pennsylvanians, one of them my constituent, Tom Larson, who is a major architect of this study, and I commend him for the many, many, many weeks and long days of hard work that I know went into this product. We're very proud of you for that effort.

I just had a couple of questions. One of the indications in your policy is that you would broaden the availability of toll financing by permitting the mingling of Federal tax revenues with State funds for various toll roads, and I wondered if you have now, or perhaps provide for the record, a status report on the toll road projects that were authorized in the 1987 Highway Bill.

If you don't have it, we can get it for the record.

Secretary SKINNER. I don't have it on me, but Tom may.

Mr. LARSON. We don't have a definitive report on those, Congressman. As you know, projects like that have a long gestation

period, but the ones that were specified for Pennsylvania are moving forward.

Others around the country are all moving forward, and we think that it is an opportunity. I was particularly struck by the concern that these projects not become the sole source of funding, and we're going to be very careful about that in working with the Congress to make sure that all the money isn't attracted to corridors where there is the potential for private participation.

This is one of the functions of the Federal Government to level out these kinds of concerns.

Mr. CLINGER. I note that the policy puts a great and, I think, well deserved and appropriate emphasis on increase in research and development in a whole range of areas.

Seventy percent, I believe, is the projected increase. That's an area, I know, Dr. Larson, you and I share the feeling that we could be doing better in developing materials for highways and various things, design criteria, et cetera.

Could we get some idea of what sort of technological advances you might anticipate from this increased research and development funding and where it's likely to be focused?

Secretary SKINNER. We can. I think there were nine total demo states in the 1987 Act; three are under construction, three are still picking the exact routes, and three have had the projects selected, but they haven't yet been started.

So it has been moving forward. One of the areas, it's interesting enough, in a week or so I'm going to be visiting Texas, and we're going to be looking at some new toll road technology which allows sensors to detect automobiles as they go through the toll booth and automatically record, and then subsequently charge the owner of the vehicle, every time it passes through that toll booth, which, of course, would eliminate some of the manual considerations that have been involved.

That's an example of technology on a very limited scale that I think people are looking at today to make the use of these infrastructure more efficient.

There are many others. Intelligent highway vehicle systems, which you're familiar with, which will allow us to manage the available space that we have now in a more efficient manner and allow the driver to make informed decisions based on actual congestion conditions on various alternative routes as the trip is progressing.

Mr. CLINGER. Just one final question. I know that the policy does not contemplate much involvement of the Federal Government, if any involvement, in Amtrak, and you talk about the necessity to involve private sector and involve other sources of funding.

Do you have any scheme in mind in that regard?

Secretary SKINNER. I think two things came up when we discussed passenger rail. Number one, the corridor in the northeast is a very, very busy corridor, and Amtrak has relieved the capacity problems.

Even though that's the busiest corridor in the system, Mr. Claytor, who is doing an outstanding job as President of Amtrak, advises me that they still lose $200 million to $300 million a year, and that's where half of their subsidy goes.

They have no real long range capital program. They have not explored in depth what a high speed rail system would look like and what impact high speed rail could have on their current job and mission and what it would cost to go to a high speed rail, a MAGLEV or some other kind of similar technology on, say, the New York-Boston corridor and what that would do to enhance the system.

So at my request, we have begun working with Amtrak on probably the most comprehensive study of passenger rail in many years in this country, and we anticipate that will be done by sometime this summer.

Then we will be able to make more informed decisions of not only the short term needs and how they're doing on their objective to become self-sufficient, but also what the benefits are of any long term investment that might be made either in existing technology or, hopefully, in high speed rail technology, which offers so many benefits to the many parts of the world that are now using it.

Mr. CLINGER. Thank you. I just want to again commend you for your leadership and the whole panel's leadership and what you've accomplished over these past months in developing this policy.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman.

Mr. Secretary, you know the problems that face the rural parts of our Nation today very well. We've seen reduction in services in one type of transportation sector after another with the deregulations that have come down the line.

Deregulation obviously has been beneficial to very large markets in this country, coast-to-coast travel, the big cities, the competition is great, and fares are down.

However, in the rural parts of our country we've seen loss of air service, we've seen loss of trucking service, we've seen loss of busing service, we've seen roads in decaying condition, and now we are seeing, if I interpret your statements here today and your recently announced policy correctly, that the States which have the most rural areas of our Nation within their boundaries, are being asked to come up with more financing to make improvements needed in our infrastructure.

These are States that have severe deficit problems of their own, like my home State of West Virginia. How do you envision, in these rural parts of the Nation which are so devastated because of lack of service after service, that we ask them now to come up with more money, especially when they have population losses because of the lack of proper infrastructure? How are they expected to meet the needs that face the people, that face the industry in the area, when they just cannot come up with this further funding from their end of it?

Secretary SKINNER. Congressman Rahall, I would make two observations. Number one, the more State and local funding that is available in the urban areas of America to deal with infrastructure problems, the more Federal funding is going to be available to at least allow States like West Virginia and the Dakotas and others to compete for such funding.

Number two, it has been my feeling that the proper balance of Federal funding between State urban areas and rural areas is appropriately discussed and decided in the reauthorization process. That highway reauthorization process that will go forward next year.

Just as you and your associates, in what I call the non-urban States, will be fighting for proper equity, balance and priority, I also think that your co-workers in the Senate from those States will also play a very significant role.

If those two groups are able to get together and make their case for a reasonable approach to what I call the non-urban problem, then I think those States will have an effective program.

To the degree we can identify those programs and come up with effective ways to show how that would be done, so that it can be open for discussion, I think is a very appropriate role.

But this very delicate balance between urban and rural America is something that I think we're going to need a lot of advice before making our position known. We're going to want to get a lot of advice and watch this evolve in the House and the Senate before we finally come to a decision.

That's not to say that we're not going to have in our National system of priority some highways that go through rural areas of America that will be Federally funded, because we will.

But just how many will be included will depend a great deal on how this compromise comes out between the urban interest and the rural interest.

Mr. RAHALL. I appreciate that response. One example that comes to mind immediately, where rural sections have formal coalitions that you discussed is in support of the Appalachian Corridor System.

That system is currently not scheduled to be completed until the year 2065. There have been proposals presented in both this body and the other body that would speed up the completion of that system by using Highway Trust Fund monies.

Would you care to comment on that?

Secretary SKINNER. First of all, that's a very ambitious project, much of which will have to go through the reauthorization process.

I do want to take this opportunity to talk about the trust fund issue, because I feel, very frankly, that this is probably the most misunderstood issue that I face on a day-to-day basis.

If we were to take the $19 billion in funds that Chairman Anderson talked about and break them apart into what I call committed versus uncommitted funds, we would find that by the end of 1991, $11.6 billion of that $20.5 billion will be committed.

About $2.5 billion will be uncommitted transit funds, and a good portion of the uncommitted transit fund problem has been due to the speed in which transit projects have been able to be brought to the decision process.

Then we have $6.4 billion in what I call uncommitted aviation funds. Assuming that we take a proper balance on the aviation expenses of this country, and if, in fact, we fund aviation operations out of the trust fund, rather than funding it out of general revenues, as we have traditionally done, partially because of the penalty provision that was enacted by the committee, that is causing the

trust fund to build and the general revenues to fund operations, we would find that the aviation trust fund would significantly decrease in a not-too-distant future.

The trust fund issue, to some degree, is an issue that is nice to talk about, but when one really looks at the facts, they show that it is not nearly as big a fund as people believe, and more importantly, using the trust funds are not the long term solution to the infrastructure problems of this country.

Mr. MINETA. Will my colleague yield?

Mr. RAHALL. I'd be glad to yield.

Secretary SKINNER. I knew we were going to discuss this.

Mr. MINETA. No, the only problem is, that when you say operations, Mr. Secretary, that really triggers me off. The trust fund was really intended for capital improvement purposes.

It was started that way. It was funded as a user fee for capital improvement programs. President Nixon first broke that principle in 1972. I believe it was in terms of funding the operations of the aviation system.

I understand that. There are some parts of the FAA that ought to be funded in terms of its operations from the trust fund.

My only concern is to continually go into that cookie jar is really, in the long run, not good public policy.

Secretary SKINNER. First of all, I wouldn't challenge the Chairman's institutional knowledge. I am told by some who also have institutional knowledge, but I have not confirmed it myself by looking at the record, that when the trust fund was initially conceived, for aviation, for example, they did talk about operations, and shortly afterwards, in order to protect it for capital purposes, it went to capital and stayed there for many years. The argument in recent years has been whether or not you should go back to the original intent.

But assuming for a minute that your institutional knowledge is superior to those who have advised me. I would suggest that we put history aside for a moment.

Let's look at the future of the Federal budget and the challenges that are going to be placed on the Federal budget. What is the best way to ensure a continuity of funding for the aviation system of this country, given the tremendous requirements that have been placed on general revenues?

We heard this morning at breakfast a very interesting analysis by Congressman Gray, which I have heard in the Cabinet Room and has been brought to my attention by Director Darman, on the very limited amount of resources that are available for discretionary programs.

Once we deal with the problems of interest, entitlements and a certain component for defense, we are vying for the remaining general revenue discretionary funding, and competing for that very limited funding. We compete with such problems as the savings and loan crises, the Pepper Commission Report on unfunded health care, the $200 billion to $250 billion high level radioactive waste problem, and other crises that are down the road that we haven't even talked about yet.

I believe, and this is very fundamental to the discussion that I think we'll go through this year, that we are better off where we

have user fees available to provide and develop a secure method of funding the non-military operations of aviation because that will ensure we won't have to compete for very limited dollars, against the crises I mentioned, and the crises of the future.

If we don't, in the long run we're going to be, and our successors are going to be, arguing this problem ten years from now. While it might not be the problems of today like high level radioactive waste, it might be wasted space or superfund problems or other matters.

So that's the basic concept. It outlines the discussion which we will have to resolve as part of the reauthorization process, but I believe it makes sense to do so.

Mr. MINETA. There was also that other part of the discussion this morning when the problem of the 302(b) allocation came up.

I have no problem with what you said about user fees and the dedicated aspects of using those funds. Toll roads is a good example.

I mean, what better example of a direct user fee than toll roads? But the problem is they're not being used for those purposes.

They're being sat on. We can always talk about it as capital funds. I thought it was for capital improvements and still feel that way. From my experience, at least, on the Aviation Subcommittee. I don't think it's any different as it relates to the highway trust funds.

So, I really feel that I have no problem with what you're talking about in terms of user fees. If we're going to do that and I support it, then let's take it off budget. Let's have the Gramm-Rudman requirements not be applicable to user fee funded programs.

That's all I'm saying. I suppose we can discuss this in terms of public policy for a long time. OMB's problem is something else.

They've got to deal with the fiscal problem of how to handle it. I don't think it ought to be at the expense of the users of the system who are willing to pay, but are not getting the benefits.

That's why I think we break the trust in the trust fund concept, if we take that approach of saying, well, that's all right, keep taxing the user, and don't use it for its intended purposes.

I think it's a credibility problem, and I just think we ought to be able to use the funds that are there for its intended purposes.

Secretary SKINNER. I might just respond.

Mr. MINETA. Absolutely.

Secretary SKINNER. The National Transportation Policy calls for a spending down of the trust fund. Not counting interest, if you look at the expenditures on highways, three of the last four years spending exceeded receipts, although there has been a balance in the highway trust fund, and that fund is different from aviation, as you and I know.

We don't make the operations capital argument that we make in aviation with respect to highways. So we're not spending all of the interest that's built up. We're spending to some degree but not to the amount of the interest, into the unrecovered balance, but a good portion of that balance is committed to projects.

Mr. MINETA. In this policy that was issued today, are you still saying we ought to go ahead and draw down against it? Is that right?

Secretary SKINNER. Yes, that's correct.

Mr. MINETA. All right.

Since I had taken time from you, let me continue to recognize the gentleman from West Virginia.

Mr. RAHALL. Thank you, Mr. Chairman.

I totally agree with the Chairman's responses to the Secretary and have the same concerns as he does. Mr. Secretary, I just have one final question that concerns the concept of wayports which I understand the Administration has endorsed in principle.

We see what is happening with essential air service, and I know that Chairman Byrd of the Senate Appropriations Committee and the other body is as concerned about that service as I am. He will have a very important say before that is completely wiped out.

But with the elimination of essential air service, as it appears headed toward, would not wayports be a good concept for the rural areas of this country? Would it not serve the national interest to build such facilities to serve as transfer points for cargo and for people in an effort to relieve the congestion that currently exists and is expected to get even more horrendous at our major airports in this country?

Secretary SKINNER. Well, let me say, Congressman, that wayports were something that were discussed early on when I became Secretary, and I began to explore it in greater depth, and there seems to be a feeling from the users of the system, as well as the people that provide the service, that waypoints may not offer as many of the benefits as was initially thought they would.

Therefore, there is not a consensus building toward a massive wayport system in this country. As I understand the argument that is made by the people who build the airports and who would have to build the wayports, because the Federal government owns no airport, is that they need the local traffic as well as the transient traffic. If, in fact, there is both, then an airport will really pay for itself.

But to ask people to go to major hubs and then commute from, for example, Washington to Lincoln, Illinois, then into Chicago, or make it to Charleston, West Virginia, and then into Chicago, from a market viewpoint, that concept is not acceptable, nor can it be justified.

In light of the questions raised concerning the nature of the wayport concept as it was initially proposed when I first became Secretary, it has not met with a great deal of acceptance from almost any sector of the business. Therefore, absent congestion problems of a major magnitude that cannot be solved in any way by new airports, that would be located where we have both a local and an intrapassenger component, I think that wayports are not going to be part of in our near future.

Mr. RAHALL. Well, we obviously have the congestion problem, and it's going to get worse by all studies. The idea of building new airports is fine, but where are you going to build those new airports?

We find that around the major hubs today there's just not the space, there's just not the public support, the noise pollution is already of such a nature that there's just not room to build those ad-

ditional airports or even expand the current airports, so where are you going to build those additional facilities?

Secretary SKINNER. Well, Congressman, I——

Mr. RAHALL. If you don't go to the rural areas in the Nation where there is adequate land, adequate air space, where will you go? Doesn't this reality support such a policy?

Secretary SKINNER. Let me just say that if, in fact, those conditions exist, and they do, the primary problem is in the northeast, where they're real critical.

But I have at least one mayor who wants to build an airport bigger than O'Hare in Chicago, I have the State of Indiana that desperately wants to have the same opportunity, and the people, as Congressman Hastert knows, of Urbana and Kankakee also want to build that airport.

So therefore, in the most congested area we have in the country, we have people that are presenting footprints and space that offer both interstate as well as local traffic.

In Denver, there's a similar situation. So in those areas where we can't meet the capacity problems, wayports have a better opportunity than in those areas where they have shown a willingness to expand airport facilities.

If we move to joint use facilities and begin to use such facilities, I think you'll see even greater facilities made available which won't require an encroachment on land owners. We're working with the Department of Defense on some of those opportunities in metropolitan areas for joint use facilities.

Mr. RAHALL. Thank you.

Mr. MINETA. Mr. Packard?

Mr. PACKARD. Thank you, Mr. Chairman.

My first question was on the spend down portion of your plan of the trust funds, and you have addressed that to some degree.

I would just be interested to know if the plan actually outlines a time table when those trust funds will be used and spent down, and also I'd be interested to know if, in the spending down, the bulk of that spending down of unobligated funds is in the area of operations or in the area of capital improvement?

Secretary SKINNER. It does not call for a specific schedule; it talks about it in a very generic form. The FAA budget calls for a spend down of the balances in the trust fund through the allocation of trust fund monies for both operations and capital in aviation, which, as Congressman Mineta said, is a position of policy this Congress is going to have to resolve.

In the case of highways, it calls for a general generic spend down, but not to any degree of certainty. And I would only comment again that a good portion of that trust fund is obligated to programs that would not be completed at the end of the authorization process.

We're required, as I recall, by legislation to keep a portion of those funds available to complete those projects after the authorization period is over.

Mr. PACKARD. Thank you. Much of your new policy encourages States to take a greater role and a greater responsibility in raising the funding for highway and transit improvements.

Most of the State capitals are finding a significant amount of resistance in developing new taxes and new fund raising mechanisms within the States to match, even at the levels that we are now currently looking at.

Of course, you call for a greater flexibility to be given to the States and the local counties and cities. Many of the cities and the counties that come to me and ask in developing a new transportation policy for the next 30 or whatever years that it would be nice if some additional funds would be made available to the cities and counties.

To what level of flexibility are you looking at, and have we changed in your policy the fundamental mechanisms that have been in place for the last 30-year plan, in terms of gas tax and in terms of highway truck fees, aviation ticket fees, et cetera?

Secretary SKINNER. Well, let me see if I can address part of it and then ask Dr. Larson for the follow-up on it. Number one, I've been all over this country talking to Governors, mayors—I think I've talked to every local organization there is—and I have also done some statistical work-up on what States have done in raising their user fees.

While you have a very big initiative going on in your State right now, as you know, 33 States have raised their gas tax user fee in some way or another in the last two years; 18 took some attempts, and most of those attempts have been successful.

I think where it's properly packaged and properly explained to the voter, the voter has accepted a user fee increase as long as they're assured that it will go for infrastructure improvements and to eliminate congestion, whether it be in the air or on the ground.

If I might reflect on California for a minute, Administrator Clymer and I were in California recently to do several events and speak, and he and I almost simultaneously noted and were quite surprised at the price of gasoline in California.

It was, as I recall, 78 cents for leaded gasoline, and 83 cents for no lead. It is the most congested area in the country, and it is the worst environmental area in the country, yet, at the same time, when you suggest raising the gas tax five cents, which has an environmental benefit as well as an infrastructure benefit, you meet a certain amount of resistance.

In fact, the poll I saw last week doesn't bode as well for the gas tax as I hoped it would, and that's in a State where infrastructure and the importance of infrastructure was brought home in the fall with the earthquake in northern California.

I think we've got to do a better job of explaining to the people all over this country, but especially, frankly, to the people of California that, if they want clean air, if they want efficient transportation, if they want to eliminate congestion, and they want back-ups in case of earthquakes, they're going to have to pay more for fuel than the lowest price that's being paid almost anywhere in the country, which happens to be California.

You go up to the northeast and ask them what they're paying, and I guarantee it's not 84 cents a gallon.

Mr. PACKARD. Well, in my area of San Diego County, it's not 84 cents a gallon, either. You can't get it for less than $1.10.

Secretary SKINNER. That was in Los Angeles. I know the cost of living in San Diego is higher.

Mr. PACKARD. Certainly, one of my concerns is the relationship between the States and their funding mechanisms for highways and their efforts to raise gas tax and fees and other revenue sources, and we are competing with them at the Federal level with the same gas tax increase proposals, et cetera, et cetera.

Secretary SKINNER. Congressman, I might make one other point. Because we haven't raised the Federal gas tax, and I've heard many Governors tell me this, it has given them an opportunity to raise their State and local gas tax to come up with a greater local share, thus getting themselves greater flexibility.

If we had raised the Federal gas tax on a pre-emptive basis, we would have preempted many of the opportunities that are available at the State and local levels.

Mr. PACKARD. I totally agree with that.

Secretary SKINNER. By refraining from raising the Federal gas tax, we've given the states an opportunity of self-help that they're taking advantage of all over this country.

Mr. PACKARD. Is the distribution mechanism pass throughs to the States of the current system generally considered to be perpetuated in the new transportation plan?

Secretary SKINNER. Well, Tom, you want to address that. I think that is one of the areas that we think is going to have to be determined in the legislative process.

Mr. LARSON. It is not at all determined at this point. We will certainly work with the Congress to find appropriate mechanisms for that distribution. It is not set at all at this point.

Mr. PACKARD. Thank you, Mr. Chairman.

Secretary SKINNER. If you can get a consensus from all the Members of the House and the Senate on that issue, we'll be more than glad to consider incorporating it within the policy.

Mr. MINETA. Mr. Borski.

Mr. BORSKI. Thank you, Mr. Chairman.

Mr. Secretary, I'd like to follow up a little bit on the gas tax and user fee. I think I agree with you in that the voters of America would be for increased user fees, particularly gas taxes, if they were convinced that the money was used for infrastructure.

Would the President lead the way and offer an increase in gasoline tax to show some leadership for the country, and perhaps the Governors would be more willing to join in?

Secretary SKINNER. Well, the leadership is in the eyes of the beholder, and I think the President has taken dynamic leadership by urging the State and local organizations to take advantage of this window of opportunity and do it. That is the course and option that he is taking at this point rather than raising the Federal level.

Especially when you consider it's going to preempt the opportunity of State and local governments to do so.

Mr. BORSKI. Is it passing the buck at all for the President to say he thinks it's a good idea for Governors to raise it but not for himself?

Secretary SKINNER. Well, I think the Federal commitment to infrastructure throughout this country is very substantial. Most of

my budget goes to infrastructure in one form or another, and that commitment is an ongoing commitment.

Unfortunately, in many of these projects, frankly, we find that the 80 percent is Federal share and 20 percent local share. The approach is, and I must say I plead guilty to this to some degree as a former head of a mass transit organization in the Midwest, that we look at Federal funds as free funds, especially if they only cost us ten cents on the dollar.

I think you manage local funds much better and much closer than you manage these "free" funds, which you and I know really aren't free.

So when you have a greater local share which can only be generated by State and local user fees, you get greater flexibility, you get greater say in where the project goes and what it's going to be. You also, at the same time, from a taxpayer viewpoint, get better assurance that that project will be managed better because of the big state and local component. They do not want to go back to their taxpayers and raise the user fee because they overran a project.

They won't hesitate to come to Washington and ask for more money, and that's why in urban mass transit, we've gone to full funding agreements to prevent that problem.

Mr. BORSKI. Mr. Secretary, I want to ask a question, too, on the spending down of the trust funds. Not to beat a dead horse, but it is my understanding that——

Secretary SKINNER. I wish that horse was dead, Congressman. I don't think it's ever going to be dead.

Mr. BORSKI. I think that the President and members of Congress, as was pointed out earlier by my colleague from Pennsylvania, I believe have both used the Highway Trust Fund to shield the budget deficit in some form.

Is it the position of the Administration to take the trust funds off budget or to spend down, or is there a difference?

Secretary SKINNER. Number one, there is a difference. Number two, there is no program to take them off budget at this point. Number three, it is a commitment to spend it down with a start in aviation and hopefully in other areas in the future.

Not only was that the President's campaign commitment, but it continues to be. The hows of doing that and the whens of doing that remain to be seen. But I would only suggest that in the case of the aviation budget this year, if you take our budget principles on the allocation of funding, it goes down to $3.3 billion by 1995 under our spending proposals.

We're going to need some help from the Congress to do that, and they will be the principle arguments that we've talked about.

Mr. BORSKI. Is it your opinion, then, that we should not be engaging in trying to use those numbers in a budget or trust funds at all for our Gramm-Rudman purposes?

You believe that we're weaning ourselves from that process, if not immediately, we will do so soon?

Secretary SKINNER. No, I think it's two different issues. Number one, we've got to get them spent down, and we're working on that.

Number two, unfortunately, as long as Gramm-Rudman is around and the trust funds that we're talking about are as big as you might think they are—and I don't think they're as big as ev-

erybody else thinks they are or a lot of people think they are because of the commitments that are against them—those funds are small compared to the really big trust fund that's on budget, which, of course, is the social security.

So a lot of your associates in the Congress tell me that this will be the year that the Congress and the Administration will deal with the social security issue. That is above my pay grade.

Mr. BORSKI. It is my hope that if social security is worked out that the Aviation and Highway Trust Funds are coupled with it and taken off budget.

I have a few questions about public transportation, and I'm particularly puzzled as to the Administration's want to cut Federal assistance for transportation, particularly to cities with over a million people.

It will cost the SEPTA in our region $20 million this year if the President's budget is proposed. How do you propose that SEPTA make that up?

Secretary SKINNER. Let me talk about SEPTA for a minute. Let me say I think Mr. Clymer is recused from SEPTA because of his prior—is that right, Mr. Clymer?

So Mr. Clymer will not answer. If he nods, he's sleeping, not nodding.

But SEPTA is one of the biggest mass transit properties in the country. It is a transit property that has not come to grips with reality.

It is not taking the steps that have been taken in places like New York and Chicago, where the State Government has stepped up to the plate and assumed a substantial responsibility for rebuilding the infrastructure and funding the operations with a steady stream of income.

To some degree, that has also happened in Boston. That hasn't happened in Philadelphia. Members of this Congress, including you and others, must continue to explain to the people of Pennsylvania, the legislature of Pennsylvania and the Governor of Pennsylvania that if you're going to have a first class system, you've got to have certainty of income stream, and you've got to have some help from the State, because the State is benefiting.

We've got to get on with that. The fact that we don't deal with the infrastructure and we don't replace tracks and cars and everything else is putting off the inevitable.

So SEPTA can no longer, in my opinion, run the risk of assuming that we're going to have a continuous Federal income stream, because that prevents them from living up to their responsibilities.

That's not to criticize the Board, they need help from the State legislature in Harrisburg.

Mr. BORSKI. I agree, Mr. Secretary, that we need help from the Governor and legislature, but we also need help from the Federal Government.

SEPTA has raised fares last year, they're proposing to raise them again this year. According to Mr. Gambicinni, who is running the SEPTA system, he believes that he's going to have to raise fares every year for the foreseeable future, and I don't see how certainly in the short term we can ask them to take an extra $20 million cut that they're depending on.

Secretary SKINNER. I understand the argument, but I think, as I recall, that in the budget up at SEPTA there the Federal operating assistance is about six percent of the total budget.

Why can't the State of Pennsylvania and the people in the greater region who benefit from the SEPTA system that by less congestion and more efficient travel, why can't the multibillion dollar budget of the State of Pennsylvania, be used, along with probably some very innovative and creative ways in the use of the infrastructure, to deal with it?

Instead, we've got fighting going on there, and no one is willing to do it, so you come and say let's keep that six percent of our budget.

That's not going to solve the problem at SEPTA, and with all due respect, if we continue to try to think that it is, we're really letting them off the hook to some degree.

Mr. BORSKI. Mr. Secretary, to elaborate on that just a little bit, what happens to our National Transportation Plan if local governments will not cooperate?

Isn't it in the national interest that we have a mass transit system that works properly?

Secretary SKINNER. Well, there's always exceptions to the rule, and I guess right now we have just been talking about a good example.

I don't think we're ready. I'll tell you how it happened in Chicago, and I'll tell you how it happened in New York. It happened in New York because the infrastructure got to a condition that was intolerable and unsafe.

Some very effective leaders in the New York system went to New York and convinced the State legislature to put a multi-billion dollar program in there.

Putting my role aside, the same thing happened twice in Illinois. First, with the reorganization of the regional authority and the guaranteeing of an income stream, which included a more equitable distribution of the suburban and city roles. So they put in a steady income stream, and then they were forced to operate within their budget, and last year the authority went to the legislature and obtained a billion dollar first phase program to rebuild the infrastructure of the system.

It happened, unfortunately, that it went to crises in both places before the State stepped up, but the State did step up. I'm not ready to concede that the great State of Pennsylvania that's represented by two of the three amigos here can't step up to the plate like New York and Illinois.

I'd hate to think they'd want to be number three to New York and Illinois in anything.

Mr. BORSKI. Mr. Secretary, I would venture to guess that my colleagues from New York and from Illinois or Chicago, if you will, would be after the same dollars and would like to see that in there, too.

Secretary SKINNER. Oh, they all are, but it's the old philosophy that it's free dollars in Washington, let's go get it.

Mr. BORSKI. I think that people are dependent on it somewhat today, and to take it out of the system will cause great havoc.

One final question, Mr. Secretary. Today's Washington Post reports that an earlier draft of your National Transportation Policy contained a commitment to work for fairer tax treatment of employees who ride to work on public transit.

My understanding is this was deleted. Can you explain why?

Secretary SKINNER. Yes. That issue wasn't ready to be resolved, and so, rather than making a commitment and holding up the entire policy, we agreed to not take a position on that, but at the same time, to work that position with the Treasury Department with the idea of moving it forward and getting Administration's decision.

We haven't reached that point, but it's one of those things that are a follow-up from the NTP, and the fact that it's not mentioned in the policy as a decision doesn't mean it's not under active consideration.

We just really weren't ready to take a position, and I didn't want to slow the whole policy up.

Mr. BORSKI. Conversely, there's also a provision that we give a tax break to employers for parking? Is that also being considered?

Secretary SKINNER. What's happened over the years is we allow subsidized parking to be deducted. We don't allow a mass transit subsidy to be deducted above $15.

That skews it, and a lot of people would say it doesn't make a lot of sense when we want to encourage mass transit usage.

The House Ways and Means Committee met on that yesterday and took testimony on it. I think a lot of people feel very strongly that that is something that ought to be dealt with, and we're committed to do so.

So we're planning to take a look at that, and I think it ought to be focused on. I'm not in a position to say what the Administration's position will be, but we are going to focus on it.

Mr. BORSKI. Okay.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Thank you, Mr. Chairman.

Again, I salute you, Mr. Secretary, and your staff for your tenacity, first of all going out and having the hearings across this country that you did and listening to people and what they had to say, and then trying to put something together in a timely basis, and I really do think it's a timely basis in trying to address those problems.

You talk about an increase in the spend down. Approximately what is that percentage increase, do you know, in the trust fund?

Secretary SKINNER. When we talk about it in the aviation area we would spend it down from about $7 billion today to $3 billion by 1995.

In the highway area, we basically are spending it out at slightly above what the receipts are, not counting interest building up in the account.

Mr. HASTERT. That's in 1991?

Secretary SKINNER. That's in 1991.

Mr. HASTERT. Then, as you know, you've been around this game for a while, that first year spend-outs, you end up with engineering which is sometimes only ten percent of the cost that is out-year ob-

ligations, which are sometimes 20, 30, 40, 90 percent higher. Do you anticipate that happening?

Secretary SKINNER. Why don't I ask the Federal Highway Administrator to answer that?

Mr. LARSON. We are allowed to have a two-year anticipated outlay, two years of income. We're at about one and a half times that level now.

A press release was prepared during our budget preparation which really summarized it and said that if you took advantage of the full two years, you could increase spending for the next three years by approximately 35 percent.

So that's the scenario that has been laid out, as just a matter of record.

Mr. HASTERT. You know, if we really start to look at need or what projected need is, I know in the State of Illinois, and certainly under your leadership in the RTA, we made some fine strides, and we're happy to be a partner with you on some of those things that we've done.

But, you know, I was just going through a study from the State of Illinois that their projected need over a four-year period is $19 billion to bring everything up to snuff, the bridges, the roads, the accesses that you need, and the dollars available with Federal dollars and state dollars are about $4.5 billion, which means really we have a $14.5 billion gap in there someplace, and certainly it would take the whole trust fund right there to do that.

But I think we have some big problems trying to assess the needs of infrastructure and putting it together, and I think we need to be as creative as possible on that, even on the rail side.

One of the things is that we've become so independent on the subway and great separations in Illinois that it said the four-year need is a $5 billion cost, and the dollars available are $1.3 billion.

We just talked about states raising their own money for urban transit, but to increase urban transit, as you well know, in Illinois we have grade separations that are 70 and 80 years old and tremendous costs.

Are there some ways that we can help these transit systems by pumping some Federal dollars in there?

Secretary SKINNER. I'm going to ask Administrator Larson, and maybe with the help from Mr. Clymer on that issue.

Mr. LARSON. Well, Congressman, I was listening to this word "need" and reflecting that it's a word that has almost become a discredited word in our transportation field.

Everybody comes up with a number and purports it to be the truth. It's very difficult, very difficult to get a real fix on that, and if you look at the literature, you can find numbers that go from $21 billion that the Federal Highway Administration evidence supports to perhaps three or four times that, depending on the interest group that is advancing the number.

Our data suggests that the highway system is relatively stable. The bridge program is slipping, but the notion of finding a hard number that you can hang your hat on is a very difficult thing to do, and it is often misleading.

Mr. HASTERT. Well, I'm just taking state numbers that were generated by our own State's transportation, and I understand that

sometimes needs are wish lists, but there are some problems out there with infrastructure, especially in the urban areas, and I'm sure in Philadelphia and New York and especially Chicago, they have some pretty old bridges that were built for horse and buggies and today we're using them for vehicles.

Secretary SKINNER. You're right, Congressman, and far be it from me to challenge the integrity of the records from the State of Illinois, especially under our fine Governor.

But I would say that in our strategic planning in Chicago we identified about $6 billion, as I recall it, in the needs in northeastern Illinois for transit infrastructure over the next 20 years.

The $1 billion program that was enacted by the legislature is the first step toward what I think will be a multi-billion dollar program to do that, and that's being done with a combination of substantial Federal funding but substantial local funding, as well.

Mr. HASTERT. So the point is you have to have some local funding there before you can supplement the other.

Secretary SKINNER. Well, it does give us a certain amount of feeling of confidence. Where we have so many projects competing for funding, we've been giving priority to those projects where there's a greater local share.

Because, again, we think we get better management, we get more attention, we have less chance of overrun, we can give them more flexibility, which they want, and at the same time we have a substantial Federal investment. By doing that, we then have funds available to spread across a bigger sector of this country.

Mr. HASTERT. Moving away from parochial interests, if you will, on this issue——

Secretary SKINNER. Well, those concepts apply all over the country.

Mr. HASTERT. I understand. We're facing some real competition in the world, especially from a changing Europe. If you travel over there, you see every truck side and every sign board talks about Europe 1992 and updating their transportation, their competition.

Putting on your farsighted glasses here, in a sense, you talk about maintaining a strong and competitive transportation industry. How are you going to implement that, and what do you see as the means of doing that?

Secretary SKINNER. Well, what we've got to do is, number one, use the infrastructure we have more efficiently through things such as high intelligent vehicles where people in their car will be able to see the actual conditions on other parallel highways and be able to move to those highways with a degree of certainty of more efficient usage.

Number two, expanding the infrastructure we've talked about through a variety of ways, private sector, tolls and things like that, using the system more efficiently.

Number three, just building more capacity with the combination of Federal and State funding. All of that will eliminate congestion and make more efficient use of the infrastructure that we have.

Last night, the chairman of a major airline was in my office, and he discussed the results of three studies in Europe that were recently conducted by three different European organizations.

All of those three studies pointed out that the problems of congestion in infrastructure and transportation in Europe are very, very substantial.

They have not only some of the same problems that we have, but they don't even have some of the aggressive programs we have in place now to address them.

In very frank terms, that gives us a competitive advantage over those systems, and if we can take advantage of this investment in infrastructure to make our system more efficient, we're going to be able to price our product more competitively, because the transportation component will not contain the cost of the hours of delays on highways and the fuel that was burned and the salaries of the truck drivers or the barge operators or the airplane pilots, et cetera.

Therefore, the best example I can think of is up in Detroit. I visited the Chrysler plant. The plant has one hour's worth of seats and inventory for two shifts worth of production.

Every hour a manager calls the seat manufacturer 40 miles away, which is an independent company, orders the seat by fabric, by color, and by style, the manufacturer makes the seat, packages it and delivers it to the factory within four hours.

The manager has low inventory costs at the manufacturing facility, has low inventory costs at the Chrysler plant, and it's all because there's a very efficient, uncongested 40-mile interstate highway link between the two facilities.

That's the kind of efficiencies we've got to build into our system.

Mr. HASTERT. Also, then, I would assume that when you're talking about that kind of competitiveness, especially when you have the just and need philosophy, we need to unleash the regulation from our trucking industries so that they're able to do that, too.

Secretary SKINNER. No question, and our rail industry. We've made a lot of recommendations in the rail industry, and we haven't really talked about them today.

I want to do that. We have a rail system in this country that still is operating under some very, very archaic rules and regulations, and if we're going to make that rail system competitive and keep it in existence, we're going to have to make some of the changes that have been suggested in the policy.

That's going to make us the lean and mean system that we need to be if we're going to compete.

Mr. HASTERT. Thank you, Secretary Skinner.

Mr. MINETA. Mr. Clement.

Mr. CLEMENT. Yes, sir.

Mr. Secretary, I know since the 1950s, we've spent a lot of our time on our interstate system, but I think all of us know much has changed, people have changed, times have changed, our society has changed.

What do you think is our best way to solve our transportation needs now and in the future?

Secretary SKINNER. Well, number one, I think with the themes that we've talked about, is to maintain the system that we have.

This interstate that you were talking about is one of the most efficient in the world, and we've got to maintain it and keep it in good condition.

We've got to expand highways of national interest where they're appropriate. At the same time, we've got to make them more efficient in their utilization.

The way we do that is by technology and by investing in the use of infrastructure. For instance, we're investing at the FAA billions of dollars in an air traffic control system that, when it's complete, between equipment and software, will be the most complex, most efficient, most sophisticated system in the world.

That system will allow us to be very efficient in the use of our infrastructure, and I might also add, Congressman, it also creates technology that we can export to other parts of the world that are in crying need of that level of technology. They don't even have the current level of sophistication we have, let alone the upgraded versions. Those are some of the examples.

Mr. CLEMENT. Well, what about our surface transportation system? Do you think we're getting our money's worth from the amount of money that we're spending at the present time on our system?

Secretary SKINNER. I think we are getting a good return on most of our investment, but I now have the opportunity to talk about another problem that isn't discussed in the National Transportation Policy.

It deals with how we establish projects for priority funding in the Federal budget. This issue is whether or not, before we earmark a project, we're going to go through a very decent justification process so that we're confident that when that project is funded, it is going to have a realistic return on the multi-billion dollar investment we make.

We have projects that are earmarked on occasion or are authorized by the Congress on which we later find ourselves having to come back and convince them, based upon the analysis, that the projects are not realistic investments given the return on the investment.

Congress sometimes overrules us on it. The issue is where spending money on those projects, if that happens, is in the long range best interest of the country because of the utilization of resources there versus other projects that are a higher priority.

Mr. CLEMENT. Is this what you were referring to a while ago when you talked about so-called free dollars or Federal dollars versus State dollars, and many State Governments consider those so-called Federal dollars are really free dollars, and we're really not getting our money's worth?

Secretary SKINNER. No, I was talking about a little different approach, but it applies the same way. That approach is that people sit out in the States, and they say, well, we've got so much money available. Now, where can we get additional money?

They in effect say there's Program X at the Federal Government, and it's 90 percent funded, and you can go to Washington and get 90 percent of the money and put in a 10 percent State component. What great leverage!

There are a lot of rules and regulations about the management of the program, but the State or local entity can live with that, because it's 90 percent Federal funded.

They don't pay enough attention because the costs are just passed on back to Washington, and they don't have the taxpayer accountability at the local level for overruns on projects that come out of Washington to the degree they do on local projects where the local share is substantial, and they have to go back to the taxpayers and explain to them why they're raising the levy from half a cent to three-quarters of a cent to cover for the overrun.

That's the kind of local responsibility I was talking about.

Mr. CLEMENT. I know you proposed toll roads. You know, in many localities and regions of the country, that's not very popular, toll roads, and they'd prefer paying for new roads, highways, or transportation in a different way, than toll roads that many feel are a nuisance.

Are the States and local Governments going to have any freedom of choice when it comes to the proposal on these toll roads, or is this something we're going to have to live with for the future?

Secretary SKINNER. Well, let me say that toll roads aren't right for every locality and every problem, but there certainly are areas where they are right. I would like to again, go back to the Illinois example where the new toll road was opened. People who were against the toll road when it was first built, who now have seen the benefits of it and are hearing from the users how much easier it is to get to work, are now saying let's build the extension that we talked about and didn't do because it's now acceptable.

So I think that there are other parts of the country like that, but we're not going to solve the rural problems of this country by toll roads.

Tom, you may want to add on to that.

Mr. LARSON. Simply, all of our thinking is that it would be an option, not a mandate.

Mr. CLEMENT. I want to ask you about bicycling now. I know I like bicycling, I think a lot of people do, and I'd like to see us expand our bicycling program all over this country.

I think it would solve many of our problems with congestion, pollution and energy consumption that we have now, and I know you designated a person in your office that you call a Bicycle Coordinator, I believe, that spends about one-fifth of her time on that particular project now.

I didn't know whether the time has come to have a full time person involved with that, and also I'd like for you to update me about your commitment to bicycle paths and the bicycle program, not just here, but throughout the United States.

I'm from Nashville, Tennessee, and I'd like to have just a demonstration project.

Secretary SKINNER. I'd ask Dr. Larson to answer that question.

Mr. LARSON. First of all, I share your enthusiasm for bikes as a means of recreation and transportation. When I was a director in Pennsylvania, we built a lot of bikeways, and it is discretionary now.

There are funds, and as an enthusiast, I could certainly be supportive of the notion of putting more emphasis on that. One of the interesting things about bike use is the use for delivery service.

One of my daughter's best friends spent a year here in Washington as a delivery person, and I was in awe of her accomplishments.

We have gone beyond the traffic and are now moving people and goods by bicycles right here in this city and in many others. I think there is a big future.

Mr. CLEMENT. What are the obstacles with a bicycle path or program throughout our country?

Mr. LARSON. The obstacles are, I think, in part, in our own agency. I think there has been a mentality that this was frivolous.

I disagree with that and believe that we should, in fact, take it more seriously. So I think the obstacles are people obstacles across the country, not just in the DOT.

Mr. CLEMENT. With these new bicycles, my goodness, people can get to work no matter how many hills and valleys they have to cross, and I think that would put that much more emphasis on the environment that I think all of us are concerned about, the quality of life issue, and I think it would offer us a new dimension that we do not have now.

I know your Department, Secretary Skinner, could surely be the leader in that area.

Secretary SKINNER. I met with a bicycling group a few months ago and agreed to assign someone to be the coordinator within the department for bicycling, and I think if that hasn't been done, it's in the process of being done.

Mr. MINETA. If my colleague would yield, Mr. Larson, I believe it's on page 96.

Mr. LARSON. Yes, it is. Thank you, Mr. Chairman.

Mr. CLEMENT. Thank you, Mr. Secretary. Were you going to say something else?

Secretary SKINNER. I was just going to ask Tom whether that's been done or not.

Mr. LARSON. I'm not aware of that.

Secretary SKINNER. We're not sure. You see, now we get into the big jurisdiction question: should it be in highways or should it be in the policy office?

So normally that's a six-month process, but I think I can expedite it.

Mr. CLEMENT. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Grant?

Mr. GRANT. Mr. Chairman, at this time, I have some questions; I'd yield my time to Mr. Upton and Mr. Emerson, who are senior to me on the committee.

Mr. MINETA. Mr. Upton?

Mr. UPTON. Thank you, Mr. Grant.

Mr. Secretary, I want to congratulate you on your study and your willingness to come up here so many times during the first year of the Bush Administration.

I think all of us on the committee certainly have the public in sight, and I think I can speak for many if not all of my Democratic colleagues that we're very glad that you're down at the department, and we're delighted that you're here this afternoon.

This morning, I was asked a question by one of my local media radio stations in western Michigan with regard to user fees as it pertains to the Coast Guard, which, of course, is under your jurisdiction as the Secretary for the Department of Transportation.

My response was very easy, because I support user fees for the Coast Guard, as long as they are for vessels that are on Coast Guard navigable waters, obviously, a modest fee, we're talking in the neighborhood of $20 or $25 a year, and as long as all of the funds, all of them, go to Coast Guard activities such as search and rescue.

I'm hopeful that we'll have an amendment later this year led perhaps by Saul Conti to see if we can get Congress to adopt something like that.

You've talked in your testimony this afternoon about user fees and the importance of dedicating them to the prescribed purposes, very much along the lines of what I support with regard to the Coast Guard.

I think almost probably every member of this committee would agree that if we can construct the user fee along the lines where all of the funds are prescribed to go to a certain purpose, we would support it.

Are we spending every penny that we collect for highways and mass transit through the gas tax today?

Secretary SKINNER. On the current basis, regarding the Highway Program, this year's budget spends more than we take in in taxes.

In fact, there's a chart here that goes on ad nauseam on, from 1984 to 1995, on whether we had a surplus or deficit year. I think in both the transit and highway account, and it shows that in many years we had a deficit, a few years we had a surplus.

Our proposal this year generates the smallest surplus we've seen since 1984.

Mr. UPTON. So your table shows that the spending in the trust fund for the highway actually exceeds the revenues that have come in?

Secretary SKINNER. I'll let Dr. Larson explain the highway account and let Mr. Clymer explain the transit account for you.

Mr. LARSON. In the case of the highway account, most of the balance that is so much talked about was built up in the late 1970s and early 1980s, and since then, with a few ups and downs, we've been spending the income plus the interest of that account.

Mr. UPTON. Well, in the testimony that's come out this afternoon, you also indicate that part of this package that you've sent up, in fact, in the future we will be spending down the trust fund.

In essence, you're saying that we've already been doing that in the last couple of years. Is that correct?

Mr. LARSON. No, there is a balance of about $10.6 million, and, as this press release that I referred to a few moments ago specified, within the law, we could accelerate by about a 35 percent a year increase, and that would go on for about a three-year period.

That is the potential that could be realized from the funds in the Highway Trust Fund.

Mr. UPTON. Okay. When you ask for more spending by state and local units, are you at the same time reducing Federal funds, then, or are you, in fact, increasing Federal funds when you are asking the local and State forces to also increase?

Mr. LARSON. If I may respond, that issue is not yet before us. This is a strategic plan. It does not get into the details of what is properly the reauthorization which is still before us.

Mr. UPTON. But am I correct, though, when in your proposal you ask the states to spend more money, you're not at the same time saying that the Federal Government will be spending less than it is today? Is that correct?

Mr. LARSON. That statement has not been made at this point in time. Again, the issues there will be part of a reauthorization process that will go on with the Congress.

Mr. UPTON. Okay. Thank you.

Mr. Secretary, you indicated earlier this afternoon that, in essence, state and local officials often have better local decision making than they do at the Federal Government.

I note that the state that I represent, Michigan, since 1956, the last 30 some years, we've been a donor state. We have provided more money through the taxes that have been collected than in fact we have received in highway projects throughout our state.

When you ask the states to provide more money in this proposal, would you also consider lowering the Federal tax for those states that are donors, or at least transferring perhaps a greater share than 78 percent to those states that have been donors?

Secretary SKINNER. I think I'll stand by my earlier position that I'm more than glad to accept the position that the members of the House and the Senate from both the rural and urban areas can collectively agree on.

You know, I think that one of the problems there and the reason that we've kind of ducked that issue is because there has been such a unique legislative debate on the proper relationship and allocation that I'd like to hear from all sides before we make an informed decision.

Not to do so would make my decision uninformed. That's why I'm hesitating on that.

Mr. UPTON. I'm glad to be the first to twist your arm, then.

Secretary SKINNER. Let me just say on Coast Guard user fees before we leave it, I'm delighted to know you and I both understand the importance of the Coast Guard, especially in the Great Lakes area.

If you take aids to navigation, which are an important part of search and rescue, and combine the two, we estimate that in 1991 we'll spend $987 million on search and rescue and aids to navigation. Even if our user fee proposal were enacted, it would only generate about $150 million in revenue.

So we have a long way to go before we cover the cost of search and rescue. So you understand where I stand on that, I think the basic mission of the United States Coast Guard has been and continues to be in the area of search and rescue, aids to navigation, and marine and environmental safety.

While we have an important role to play in the fight against drugs, we do not want in the long run to compromise our responsibilities that we've been doing very well for the past 200 years, and we're just not going to do that as long as I'm Secretary.

Mr. MINETA. Would my colleague from Michigan yield?

Mr. UPTON. Yes, sir.

Mr. MINETA. When you spoke of the trust fund balances, I was wondering, what about the Urban Mass Transit Account? In terms

of the income and the outgo, are we spending more than we're taking in, as you've indicated?

Secretary SKINNER. Yes. Mr. Clymer will answer that.

Mr. CLYMER. Mr. Chairman, similar to the Federal Highway Program, most of the balance in the Mass Transit Account developed in the early 1980s. In this year and next year, we'll be spending slightly less than the amounts going into the trust fund, although, as the Secretary pointed out earlier, in our 1991 budget, the excess will only be in the neighborhood of approximately $250 million, which is the lowest amount that will remain unspent since 1984.

Mr. MINETA. Why is that occurring?

Mr. CLYMER. Congress has only allowed us to spend up to approximately $1.1 billion a year of trust fund revenues, and in actuality I think there is somewhere in the neighborhood of $1.4 billion going into that fund from the penny gas tax.

Mr. MINETA. The $580 million in terms of operating subsidies, that comes out of the general fund?

Mr. CLYMER. That's correct.

Mr. MINETA. Thank you.

Mr. Skaggs.

Mr. SKAGGS. Thank you, Mr. Chairman.

I have to make an observation to my friend from Florida, Mr. Grant, that if only certain decisions hadn't been made, of course, he'd still be senior to me over on this side of the aisle.

Mr. Secretary, when you're at this point in the afternoon's questioning and others have talked philosophy and concept, I've had a chance to get down the level of individual words in your statement.

One of those that I'd like to ask you about appears on page 2, and it's the choice of the word amenity, environmental amenity, which, to my mind, carries the connotation of a sort of secondary level of consideration that I hope I am misinterpreting.

I'm wondering if, taking off from that, you might give us your thoughts on how important environmental factors are or ought to be, in your mind, as we do work to develop the kind of integrated transportation policy that you are proposing for the country.

Secretary SKINNER. Oh, I see, it's in my testimony.

Mr. SKAGGS. Yes, sir.

Secretary SKINNER. Oh, that's even worse. I thought it was in the statement in our policy, and I could blame it on Dr. Larson. But I have just recently approved the statement, so I can't.

Well, "amenity" does not indicate anything other than an attempt, probably inartfully—maybe it was put in there by one of the other organizations that are accused of wordsmithing my statements—it really does not mean secondary.

In fact, Dr. Larson and I were talking today, he has just returned from a trip to Turkey and Europe, and we were talking about the problems of the environment in those countries. I think he and I both agree if you really want to see what the automobile can do to the environment, all you have to do is go to Greece and Turkey, and you will see air that you can barely breathe.

We have committed to and worked with the Administration on the Clean Air Bill and on the mobile sources issue. I believe a very reasonable compromise was reached in the Senate, and we will con-

tinue to work with the Conference Committee when the bill gets to conference in order to reach a solution that makes sense.

Environmentally sound projects are part of this overall process and in everything we do. At the same time we protect the environment, we want to make sure that we don't unnecessarily stop projects where the real environmental risk is minor or gets tied up in form over substance.

I participated in the development of the MOA and the subsequent MOA on the wetlands issue between the Corps of Engineers, the EPA and other Departments of Government.

We heard from almost 40 States all over the country about their concerns over the permitting process and the problems that they had with some portions of it. We heard about their concerns with projects going forward where there was really no wetlands impact, other than an impact to technical, a definitional wetland rather than an actual wetland.

So we've been trying to push forward on the environmental issues while at the same time making sure that we don't, in the words of someone, throw out the baby with the bath water.

I think we've reached that in wetlands, and I think we've reached that in clean air. There's no question the President is committed to it.

All you have to do is sit in on the meetings that I sit in on and watch him express his concerns. I might add, if I can depart, I think that the process that we went through, the interagency process, not only in the development of this plan, but in the development of the MOA and everything else, is a very healthy process.

Just as you don't want your constituents not to be heard before a decision is made, it is unfair to go through a decision process without having every constituency heard on their concerns.

Governor Sununu, in his development of the process, was really the gatekeeper to make sure that everybody was heard. Unfortunately, I think he has been portrayed as something of a roadblock.

What he really was, was a facilitator so that a very comprehensive program could be put together without literally failing to listen to or totally ignoring legitimate concerns by most of the states in this country.

Mr. SKAGGS. I did not intend necessarily to push the button about the clean air situation with you, but looking prospectively, and I hope more congenially, at where we may be as we deal with the Highway Reauthorization Bill, I gather from your comments that you do see a positive and central role for environmental considerations generally and air improvement in particular to play in fashioning that legislation.

Secretary SKINNER. Yes, although the only reason I got into clean air, Congressman, as you know, is that it has such a broad impact across all areas, including the mobile sources area.

Mr. SKAGGS. Related, however, since you did bring up the current actions on clean air, as I understand it, the Senate compromise that's been worked out would mean that the Department of Transportation would no longer be the lead agency in coordinating approval of State implementation plans.

How do you see that affecting the administration of a Federal aid program for highway construction? Perhaps that's a question you want to refer to one of your colleagues, but I'm interested.

Secretary SKINNER. I'd love to refer that to Dr. Larson, so thanks for the suggestion.

Dr. Larson, do you want to take that one?

Mr. LARSON. We have had concerns about that question of implementation, but I come from a position where the concern for the environment is transcending some of the concerns that we have traditionally had.

I believe that we can work successfully in this new program, and I'm very much committed to doing that as Federal Highway Administrator.

Mr. SKAGGS. No objection from you, then, on this count?

Mr. LARSON. No objection from me with respect to lead agency responsibility for approval of SIPS.

Mr. SKAGGS. Just one final area of inquiry, if I may, Mr. Chairman.

I appreciated your references in several places, Mr. Secretary, in your statement to the need for greater flexibility.

Do I read you correctly there as indicating, again, a willingness on the part of the Administration to contemplate, let's say, removal of some of the restrictions and conditions attached to certain kinds of Federal assistance if local areas, and I'm thinking about the effort that's underway in my area now to develop a really integrated multi-modal transportation funded overwhelmingly by local resources, you would react favorably to the idea of permitting the Federal pieces of that, both mass transit and highway dollars, to be pooled and provided with some greater flexibility to local governments?

Secretary SKINNER. Yes, we can make some pretty strong arguments for that. Obviously, some of that is the legislative process that we're going to have to go through, especially on these funding sources.

I must say I think that while we have broken down the barriers of modal resistance within the department, I'm not so sure the interest groups in the highways and aviation areas have quite seen the light yet.

So we have some missionary work to do with them, and anything you can do to encourage the intermodal approach by surface and aviation interests will be appreciated.

Mr. SKAGGS. Well, I expect we may need to deal with this issue in terms of building in some flexibility under the Reauthorization Bill, and I just wanted to make sure I understood where you all would be on that issue.

Thank you very much, Mr. Chairman.

Thank you, Mr. Secretary.

Mr. MINETA. Mr. Emerson.

Mr. EMERSON. Thank you, Mr. Chairman.

Mr. Secretary, welcome. Just a couple of questions here. You stated that among your goals and objectives, one of them is the promotion of effective connections between rural and urban areas.

I take that to mean in conjunction with the Federal Highway Act Reauthorization, and I'm sure you'll have more specific recom-

mendations, but as one who represents a very rural area that is interested in better connections to urban areas, I wonder if you have anything specific in mind that you could share with us at this time?

Secretary SKINNER. Not too specific. Dr. Larson may want to amplify on that a little bit.

Mr. LARSON. Well, first of all, the system of national significance that has been much talked about, it's certainly not set in asphalt or concrete yet, but it would run in rural and urban areas, and we would work with the States to define the specific corridors.

Beyond that, there has been talk in AASHTO and in other associations about a new access program that would be added to what we've talked about up to this point which would specifically reach out into the urban areas.

I have been reminded many times by the Senators from rural states, by House members, and Governor Kay Orr some time ago said that we must not disconnect rural America from the main stream of America by disconnecting the transportation networks.

So we're very sensitive to that concern.

Mr. EMERSON. Well, I appreciate that, and not only do we not want to be disconnected, we want to be better connected.

So as we look to the reauthorization of the Federal Highway Act, I hope you'll bear that in mind, and we look forward to working with you to share some ideas.

Another thing, Mr. Secretary, I'm wondering if you have any hope for an expanded rail system in this country through the private sector.

In other words, are you seeing from where you sit any evidence that there is a market demand in the foreseeable future for an expanded rail system, you know, out of the corridors that traverse the megalopolis of the East Coast and probably of the West Coast and maybe a little bit in the Midwest?

I think there's a pretty good network between Chicago and St. Louis. For example, you can't get to St. Louis from Washington, DC, right now on a train.

During your tenure as Secretary of Transportation, are we likely to see us have rail service between Washington, DC, and St. Louis?

I wouldn't lay it all on the back of the Government. I'm saying is there a demand there that could generate such a service?

Secretary SKINNER. We're not sure at this point where that demand is, and, you know, as you say, there may be a demand but whether it can be justified, or whether it's a cost related demand, remains to be seen.

That's why we've really started to take a look at a comprehensive review of passenger rail in this country and where it's going and whether high speed rail can offer some opportunities that haven't existed before.

So in six months, I'll be able to answer that question.

Mr. EMERSON. Thank you very much.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Visclosky.

Mr. VISCLOSKY. Mr. Chairman, thank you very much.

I guess that Mr. Skaggs and I both got to page two. I don't know if we got much farther.

Mr. Secretary, I would just like to read from your statement on page two and page five your words, "an investment in transportation is an investment in our future economy in jobs," and on page five you use the terminology of investment again in stating, "in my mind, there is no question that improved transportation will improve our productivity as a Nation, that an investment in infrastructure is an investment in jobs."

I guess one of the first questions I would raise in terms of the Administration's commitment to their investment in a more productive economy is in response to an answer that you gave to Mr. Borski that the Administration does not support taking the trust funds off budget. Why?

Secretary SKINNER. Why did the Administration take that position?

Mr. VISCLOSKY. Why does the Administration take that position?

Secretary SKINNER. I believe that given the current budgetary situation and the current deficit situation that they don't think it's appropriate.

We really haven't reargued that. That was a position that I inherited. The Administration had taken it prior to the time that I arrived.

It has not been revisited, and I was not part of the detailed decision process, other than to know that they felt the budgetary situation we have today would be compounded if that were to occur, and, therefore, they didn't think they could justify it.

But I haven't revisited it, and I know that's the same position that they took earlier.

Mr. VISCLOSKY. Mr. Secretary, I forget which of the panel made reference to this, and it might have been yourself, in talking about the trust funds and the possible spend down, it was pointed out that in three of the last four years the expenditures from the Highway Trust Fund exceeded receipts.

Is that because of an Administration initiative or is that because of changes Congress worked on the budget proposed by the Administration?

Secretary SKINNER. I haven't got the budget proposals. What I have is the actual spend down, I don't have the institutional history concerning whether that was imposed upon us against our will or with our acquiescence.

Mr. VISCLOSKY. Well, in terms of an investment and in terms of support of investment, my sense, and perhaps I misinterpreted the comments earlier, is that there was a policy of sorts during the last three or four years to begin increasing expenditures in terms of highways.

My question is, was that a Congressional initiative or was that an initiative of the Reagan-Bush Administration?

Secretary SKINNER. Well, I don't know exactly the dynamics. I'll get that answer for you.

Mr. VISCLOSKY. Mr. Secretary, if I could, someone referenced that you have the figures for the last ten years in terms of the draw downs in terms of the Highway Trust Fund.

I would appreciate it, beginning with the fiscal year 1981 budget, if we might have for the committee record what the beginning and ending fiscal year balance was and how that was impacted in terms

38-253 O—91——3

of what the Administration's original budget request was and what the ultimate disposition was in terms of Congressional activity, because I think it's an important distinction to make in terms of investment and infrastructure.

If there has been an increase in terms of expenditures versus taxes, whose initiative is that to begin to draw down that trust fund?

Secretary SKINNER. I think that's a very good question, and I should know that, and I'll get the answer to you.

[The information follows:]

Over the period FY 86 to FY 89, outlays from the Highway Account did exceed tax receipts in three of the four years. In fact, over that four year period, spending exceeded taxes by $3.4 billion. This was due to action by both the Congress and the Administration. As the attached table shows, every Administration budget presented between 1986 and 1989 proposed to outlay more than collected over this four year period. For FY 86 and FY 88, the Congress enacted appropriations acts that resulted in higher outlays in those years than the Administration proposed. For FY 87, the Congress decided to spend less than requested, and for FY 89 the Congress chose to spend about the same as was proposed. So the answer to the year question depends on which of the four years we're talking about. In general, it is probably fair to say that both the Administration and the Congress proposed to spend more than would be collected in tax receipts, but that the Administration was slightly more conservative.

A COMPARISON OF IMPACTS ON THE HIGHWAY ACCOUNT OF THE HIGHWAY TRUST FUND OF ADMINISTRATION BUDGET PROPOSAL AND ACTUAL APPROPRIATIONS. FY 1986-89

ACTUAL	1986	1987	1988	1989
TAX INCOME	12,250	11,793	12,836	14,358

CUMULATIVE DIFF FY 86 to FY 89				-4,654

UNDERLINE = ACTUALS
NORMAL = PROPOSED IN PRESIDENT'S BUDGET
ALL FIGURES IN MILLIONS OF DOLLARS

The attached table shows the end-of-year balance of the Highway Account of the Highway Trust Fund for the first years 1981 to 1990. The end-of-year balance is a product of the budget as passed by the Congress. The beginning-year balance is the same as the end of year balance of the prior year. The bottom line of the table shows the effect on the balance, in the budget year, of the Administration's budget compared to what was enacted. A positive number indicates that the Administration's budget would have resulted in a higher balance, a negative number indicates it would have resulted in a lower balance.

DEPARTMENT OF TRANSPORTATION
FEDERAL HIGHWAY ADMINISTRATION

ACTUAL HIGHWAY TRUST FUND BALANCES
AND THE EFFECT THE ADMINISTRATION'S PROPOSED
LEVELS WOULD HAVE HAD ON THE BALANCES

($ in millions)

	1981	1982	1983	1984	1985	1986	1987	1988	1989	est. 1990
End of Year Trust Fund Balance	9,259	9,046	9,062	10,210	10,362	9,486	9,412	9,019	10,551	10,981
Effect of Administration's proposed budget..... 1/	0	-324	-774	436	130	143	125	190	50	1,013

1/ These amounts were computed by applying outlay percentages to the difference between the enacted Federal Aid Highway obligation levels vs. the amount proposed by the Administration.

Mr. VISCLOSKY. In terms of next year's budget for fiscal year 1991, it is my impression, and I would appreciate knowing if I'm correct or not, that differential in terms of the Administration's proposal for spending from the Highway Trust Fund versus tax receipts is about $700 million.

That is, we would receive and maintain about $700 million that we would not spend, according to the Bush budget proposal.

Secretary SKINNER. That's the 1991 budget?

Mr. VISCLOSKY. Yes, sir.

Secretary SKINNER. I show outlays of $1.40319 billion and income, not including interest, of $1.3768 million. In the transit account, I show outlays of $1.095 billion and income of $1.345 million. So that basically shows about a wash, if you combine the two accounts.

Mr. VISCLOSKY. My impression was, again, that the differential in terms of the receipts versus the expenditures called for in the Administration's budget shows the differential of about $700 million in taxes that would be retained and not expended.

Secretary SKINNER. That's not my understanding, but we'll get you the accurate facts, and I'll just have my staff talk to yours.

Mr. VISCLOSKY. If you could refer that to the permanent committee staff and to the subcommittee, I would appreciate that.

Secretary SKINNER. You may be counting interest, and if you're counting interest, the number you're using may be correct.

Mr. VISCLOSKY. Fine. Mr. Secretary, you did reference mass transit, and I might ask for the comparison in terms of the fiscal years for mass transit.

Another question I might have is, in terms of the spend down, I understand that no determination has been made, that a general proposal has been put forth.

In terms of when the Administration might come back to the committee with a specific recommendation, when might we anticipate that occurring?

Secretary SKINNER. On highway reauthorization?

Dr. Larson, do you want to talk about that?

Mr. LARSON. Well, I think that we're not ready yet to give a date for that. We're working vigorously, and we're working across the three administrations, but we don't yet have a date certain when we could come forward.

Mr. VISCLOSKY. Mr. Chairman, I really have no further questions. I just might note in terms of policy statement that the Secretary, in his statement, does talk about providing flexibility, a term that we have used here, to assist States and local Governments to raise revenues.

Again, my sense here is that the commitment still is not present in terms of the Administration as far as making that true investment.

Although the President was quoted in your testimony from his State of the Union indicating that it's time to act together, my sense is the message of the Bush Administration is it's time for the States and localities to act alone.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Grant.

Mr. GRANT. Thank you, Mr. Chairman.

I appreciate that. I only wish that my good friend, Mr. Skaggs, was still here.

Secretary SKINNER. So do I.

Mr. GRANT. We actually are friends more than just rhetorical friends. I would remind my friend, Mr. Skaggs, that it's more important where you stand than where you sit, and in that regard, I'm very pleased to be standing where I am.

Just one quick thing, Mr. Secretary. I'm from Florida, and I recently took a trip down the middle of the state at Thanksgiving, normally a six-hour trip that I knew was going to take less time on our bonded system down there, not the interstate system, but our bonded system, the turnpike.

It usually takes six hours from Tallahassee to Stuart, and it took me nine and a half hours. On three different occasions on that trip, the four-lane traffic was stopped dead still three different times.

The reason I mention that is to say that I know that we built a highway system or program, frankly, that was designed to build a national system.

In Florida, we don't have one of the highest tax rates in the country. We're in the lower quarter, frankly, of the taxes we levy.

But what our people see is that since 1956, there are only six States that have received fewer dollars back than the State of Florida, and, in fact, in 1988, the last figures I had a total on, we paid in $623 million and got back $467 million, and no one was lower than us.

It's very hard to justify to our citizens why we should continue to increase the fuel taxes that they pay. My question is: Might not that kind of situation lead you to decide that some of the programs in Florida, and this is very parochial, but that some of the programs in Florida might be projects of National significance?

Secretary SKINNER. I know Florida pretty well. I was down there the same time you were and have traveled all over that State and spent a lot of time down there. Florida is unique.

Governor Martinez, I think, the other day was very happy, not happy exactly, but he pointed out that maybe there weren't as many as 1,000 people a week coming into Florida, that maybe they've gone down to 900 a week and that that would give them a little breather.

The infrastructure in your State is at the top of everybody's list of concerns, as you know, and the estimates are staggering as to what Florida is going to have to do to handle their infrastructure needs.

I do believe that Florida can be more aggressive. I would assume that Florida would at least have been in an 85 percent return state, and maybe Dr. Larson can address that, but Florida's unique infrastructure problems are going to require the best minds at both the Federal level and the State level.

I've talked to Governor Martinez about what I think is going to have to be a very aggressive infrastructure program in that state even with substantial Federal commitment if those problems are going to be solved because of the growth that's going on there.

We have not focused, frankly, on what would be the networks of new national importance to the degree that we can be specific on your question.

You know, Florida also has some rural areas as well as some very urban areas. It's a unique State because of its length. Northern Florida is becoming more urban than it has ever been before, so I think we just have to wait and focus on that.

In the meantime, I think there's a lot that can be done at the State and local level.

Mr. Larson, you might address the return on tax dollar issue.

Mr. LARSON. I will provide the Congressman with data of the last four or five years of just what has happened in that account and why.

Mr. GRANT. I'd appreciate that.

[The information received from Mr. Larson follows:]

Administration**

Office of the Administrator

400 Seventh St., S.W.
Washington, D.C. 20590

March 23, 1990
Refer To: HFS-10

The Honorable Bill Grant
Member, Committee on Public Works
and Transportation
House of Representatives
Washington, D.C. 20515

Dear Mr. Grant:

On March 8, 1990, I, along with Secretary of Transportation Samuel K. Skinner and other Departmental Administrators, had the privilege and pleasure of testifying before you and other members of the Committee on Public Works and Transportation concerning the National Transportation Policy. During the hearing, you requested information concerning the State of Florida and the Highway Trust Fund. The information is enclosed.

I am pleased to furnish this information and look forward to working with you as we act together on our Nation's highway programs.

Sincerely yours,

T. D. Larson
Administrator

STATE OF FLORIDA

COMPARISON OF HIGHWAY TRUST FUND RECEIPTS
AND FEDERAL-AID HIGHWAY APPORTIONMENTS AND ALLOCATIONS

(thousands of dollars)

FY		CONTRIBUTIONS	APPORTIONMENTS/ ALLOCATIONS	NET DONATED
1985		$532,296	$539,982	-$7,686
1986		546,948	633,125	-86,177
1987		549,006	463,119	85,887
1988		623,441	467,303	156,138
	TOTALS	2,251,691	2,103,529	148,162

Mr. GRANT. As you say, we're concerned about the new formula for distribution, whatever that might be.

I find it a little unusual that both the land area and postal mileage, of all things, is still included in the distribution formula, and both are, in my judgment anyway, totally unrelated to either the extent or the use of the highway system.

I know that our Chairman is going to direct us in this regard, and I look forward to that debate.

Did I understand you to say that you are not advocating at this time any changes in the shares of project costs? Did I understand you to say that?

Secretary SKINNER. No, I think we feel that as we go through the reauthorization process, the state and local share as related to the Federal share has to be addressed and that there may be different components for different parts of the system.

We think that in many projects a greater local share is not only warranted but very practicable, and in many States they're doing that already, so we think it will have to be revisited.

Mr. GRANT. Thank you.

Mr. Chairman, I thank you.

Secretary SKINNER. Thank you.

Mr. MINETA. Thank you very much, Mr. Grant.

Secretary, in your testimony you specifically speak to redesigning Federal transit assistance to rely more on the formula distribution of funds.

I take it that this would also mean a reduction in the UMTA discretionary grant program, if not the total elimination of what we now know as the Section 3 Program.

Now, if we are to accomplish this, how we would design a funding allocation formula that could adequately anticipate and address the major capital needs of new rail starts and rail extensions.

Would I be misreading your testimony and the National Transportation Policy to assume that the Administration may in the future be suggesting a no new starts policy, or, if there are new starts and rail extensions to be funded, that that would come through greater flexibility out of the Highway Program?

Secretary SKINNER. I'll ask Dr. Larson and Mr. Clymer to answer that.

Mr. CLYMER. Why don't I start off on that? I think the idea in having more funds formula driven does allow for more flexibility initially, and our 1991 budget does recognize the need for discretionary funding, and certainly as we go into the reauthorization, there would probably be a need to discuss some discretionary program because of the projects that are outstanding.

Ultimately, in the long run, if dollars are driven on a formula basis, then they become predictable to the local areas. They'll know exactly what they're getting.

If they know on a year-to-year basis what's coming in on a formula basis, then any long term planning need not come out of a discretionary pot because they can simply go out and finance their local program based on the predictable dollars that were coming in from the Federal level and their own ability to fund at a local level the size of the project.

Mr. MINETA. Mr. Larson, do you have an expansion on that?

Mr. LARSON. No, sir.

Mr. MINETA. So hopefully that flexibility will be able to do that?

Mr. CLYMER. I think that's a longer term goal. It takes a while to wean from one system over to the other. But, ultimately, I think if a region has an idea of what funds it can expect on a formula basis, then the dollars are going where they belong, driven by formula, and they're predictable to the local area that can then decide best how to use those funds.

If they are predictable, then they should be able to do their own longer range financing.

Mr. MINETA. As it relates to the transportation projects that we have within our jurisdiction, I'm wondering, does increasing the State's share for those projects weaken the Federal-State partnership in those States that don't have the local resources to meet the Federal match requirements?

Are we getting ourselves in a spiral that really is downward driven to the disadvantage of the "weaker" States?

Mr. CLYMER. I think it's a question of financial capability, not necessarily a weakness in the States. If we're looking at what we referred to earlier as the free dollar that isn't really the free dollar, there may be a tendency to take on a project that's larger than there is local ability to either fund on an initial capital basis, or, more importantly, have the ability to operate on an ongoing basis.

So that even if an area is able to go in and get the larger Federal dollar to build a project when that financial capability may not be there at the local level, it may be inclined to go get the project, and once it's built have a system in place that it may not be able to afford regionally to operate.

So I think for the areas that are looking at these kind of systems, what's in their own pocketbook should drive the type of system that's put into place so that areas that do not have the financial capability maybe shouldn't be looking at rail systems, they should be looking at HOV lanes or bus systems, for example.

Mr. MINETA. Let me interrupt for just a minute.

Mr. Secretary, knowing you have another commitment, why don't you go ahead?

Secretary SKINNER. I might thank you, Mr. Chairman.

Mr. MINETA. If I could ask your colleagues to stay, because I do have a couple more questions.

Secretary SKINNER. That's fine. I might take General Curry with me.

Mr. MINETA. Hold it. I may have a question for General Curry, too.

Secretary SKINNER. You have some questions for General Curry? Sorry, General.

I thought for a while here that things were in such good shape——

Mr. MINETA. They are in good shape, but I'm just wondering if I might ask one question.

Secretary SKINNER. That's all right. Why don't I let him, and he can go back afterwards. Or do you want to ask it of me?

Mr. MINETA. No, sir. It's for General Curry.

Secretary SKINNER. Okay. Thank you.

Mr. MINETA. Again, thank you very, very much, Mr. Secretary, for being here and for your fine statement.

Secretary SKINNER. Thank you.

[The prepared statement of Secretary Skinner appears on page 63.]

Mr. MINETA. General Curry, this deals with the policy statement, and I'm not sure whether it's you or maybe Mr. Larson. In any event, the policy statement points out the population of the elderly drivers that is continuing to grow.

Now, this will require some refocusing on priorities that will make driving less hazardous for the older driver. I'm aware that both Federal Highways and NHTSA are closely looking at this issue and have been working with organizations that are developing strategies to address the needs of the older driver.

One of the many factors that contribute to traffic deaths and injuries includes poorly designed and especially poorly maintained highways.

What will maybe NHSTA suggest or what will the Federal Highway Administration be doing to promote design standards that will be more sensitive to the needs and abilities of the growing population of elderly drivers?

Mr. CURRY. Tom, I think you should begin with the design of the highways.

Mr. LARSON. Well, there is no question but what there is a growing population of people that are elderly, and there's also a growing recognition that vision is one of the diminishing faculties with age in many people.

The things that can be done include better lighting in intersection areas, we do that more regularly now; better signage, signs that are illuminated and have larger, more reflective surfaces, and we're doing a good deal of that; the pavement markings, simply having lines and reflectors that give signals to the driver are very, very helpful.

I think we have a kit of tools that are generally available, and it probably comes back to this question of whether there are adequate resources to do all the things that need to be done.

If it's a choice between better signage and filling potholes, unfortunately, we'd probably find many areas that would opt for the pothole filling and neglect the other.

I think that's one of the areas where we're going to have to be very aggressive in promoting better facilities, better design, better furniture for the highway, so to speak, so that the elderly population can be properly served.

Mr. MINETA. Maybe we could be applying those new standards or that kind of standard you're talking about in terms of new construction and still be able to use the money to do the potholes and now maybe do the retrofit. At the present time, is there a way of being able to balance those kinds of interests? Otherwise, if we don't start doing it for the future, we'll never even get started on improving those safety factors as the population gets older?

Mr. LARSON. There are a number of areas where the retrofit question is very keen, and certainly earthquake retrofit is one of them, after the recent experience in California.

How much of your future resource do you put into retrofitting? Those are tough questions that we need to debate as we go forward on this reauthorization.

Mr. MINETA. Well, I wanted to keep it related to the elderly portion.

Mr. LARSON. I am simply submitting that it's about the same kind of a question, and we do have to look both forward and backwards.

Mr. MINETA. I see. Okay.

General Curry, the policy statement also points out that human factors are the largest single cause of accidents on the Nation's highways.

It then enumerates several of the principal driving behaviors that result in the annual fatality rate. Could you tell us how NHTSA plans to encourage the adoption of additional programs or laws that may be required to reduce this annual fatality rate?

Mr. CURRY. I would——

Mr. MINETA. In conjunction with that, are you asking for additional funding to implement whatever those programs might be?

Mr. CURRY. We are comfortable that the funding that we have essentially as it is will allow us to do the things that need to be done.

I would add one more part, Mr. Chairman, to what Tom Larson has said, and that is that when it comes to the elderly, we have a large research program that looks into the behavior of the elderly as drivers, also.

We are concerned about the human factors of how they react, that is, their physical faculties do deteriorate over time.

We are concerned about their ability to drive on the roads, how the cars are designed to relate to them. We're certainly not at the point where we feel that we could make any definitive statements, but I want you to know we are actively inquiring into these areas, and we are doing many things, that perhaps will show us some benefit as regards the elderly of the future.

Mr. MINETA. I have one final question. In view of the increased fatalities on 65 mile per hour rural interstate highways, how will this policy provide for increased enforcement of 55 mile per hour and 65 mile per hour highways?

Mr. CURRY. As relates to speed, from my standpoint, you probably have put your finger on one of the most important things that we think can be done, and that is the enforcement of the speed limits, whether they are 55 mile an hour speed limits or 65 mile an hour speed limits.

My personal experience, and I'm sure probably yours has been, that these speed limits are violated much too often. We'll have a National Traffic Safety Summit on the first of April in which we will be meeting with law enforcement officers of all 50 States and some of our Territories.

This is on the agenda. We will be discussing exactly the enforcement of speed limits, 55 mile an hour, 65 mile an hour, those kinds of things.

Based on what we get from our law enforcement officers, we plan to relook at and retailor our programs to see if we can't do it in a much more effective way.

Mr. MINETA. Thank you very much, General Curry. Since you have a commitment, let me go ahead and excuse you.

Mr. CURRY. Thank you, Mr. Chairman.

Mr. MINETA. I have one final question. Under the National Transportation Policy, Mr. Clymer, the elimination of general funds support for mass transit has the effect of raising the relative cost of transit.

Would the adoption of this National Transportation Policy, through the department's legislative program, force higher transit fares or the elimination of services and/or the reduction in services?

Mr. CLYMER. Well, I think that's been part of the age old question in transit, even as we in the transit industry would go from year to year in our budgets as to how we would look at paying for the increased costs of providing transit services.

Every locality has to make a choice, and they have to make a choice whether it be additional support on the state level or on a local level or on a regional level, or from the fare box.

If we go around the country, we can look and see many different fare structures accompanied by different structures at the State and regional level.

Atlanta, for example, has an approximately 85-cent fare, but they have a State funded sales tax. Their fare box recovery ratio is much lower than, for example, Philadelphia, where the fare box recovery ratio is close to 60 percent, but there is no dedicated funding for transit, so, therefore, most of it has to come out of the fare box.

So I think that it's a difficult issue to assess as you're moving forward with the transportation policy and the needs increase. The needs are going to increase from a number of different perspectives.

They may increase as we look at the match ratio and are trying to leverage on a national basis more dollars into the transit industry as a whole to cover infrastructure requirements, and they're going to increase just because of normal inflation and budgetary requirements at the local level.

I think these are decisions that are going to have to be made locally. Hopefully, what we can do through the Federal program is to try to provide some stability to those programs and some flexibility in the delivery of those dollars to make those decisions easier.

Mr. MINETA. Well, let me thank the Secretary in absentia, as well as General Curry, and you, Mr. Clymer and Dr. Larson, for your being here today.

As was said this morning, this really is a good start. I'm thrilled by the fact that we've gone through this process. We have, for the first time, a document that becomes a guideline for all of us. I am frankly excited about the prospects of what we will be doing in the next 18 months or so.

It will not be without some agony at some points in terms of determining public policy or trying to make sure we have adequate funding for programs. But I know that in the bipartisan spirit of this House Committee on Public Works and Transportation and this Subcommittee on Surface Transportation, I look forward to working with the Secretary, with you, Dr. Larson, Mr. Clymer, General Curry, and everyone else in the Department.

I know that our staff is dedicated to that, and so all the way around I think this has been a good start, and I look forward to the final product whenever that's out.

I know we have to have it in place by September 30, 1991. So that's my intent. I'm quite sure we'll meet that goal.

Thank you very, very much.

Mr. CLYMER. Thank you, Mr. Chairman.

Mr. LARSON. Thank you.

[Whereupon, at 4:53 p.m., the subcommittee was adjourned, to reconvene at the call of the Chair.]

PREPARED STATEMENT OF WITNESS

STATEMENT OF THE HONORABLE SAMUEL K. SKINNER
SECRETARY OF TRANSPORTATION

before the
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SURFACE TRANSPORTATION SUBCOMMITTEE
U.S. HOUSE OF REPRESENTATIVES

concerning the
NATIONAL TRANSPORTATION POLICY AND HIGHWAY, TRANSIT,
AND HIGHWAY SAFETY REAUTHORIZATION

March 8, 1990

Mr. Chairman and Members of the Committee:

We are pleased to have the timely opportunity today to discuss the National Transportation Policy which President Bush released this morning at the White House. This Committee is one that has a major interest in the National Transportation Policy and will have a large share of the responsibility for translating it into national legislation. This is the first National Transportation Policy since 1978.

Today, at your invitation, I have with me three of the Department's key administrators whose programs are encompassed in the Policy -- Thomas Larson, the Federal Highway Administrator; Jerry Curry, the National Highway Traffic Safety Administrator; and Brian Clymer, the Urban Mass Transportation Administrator.

We initiated our National Transportation Policy development process a year ago, feeling that it was time to take a new look at transportation policies. We went out to the American people in more than 100 public meetings. In essence, what we heard was a

call for an improved transportation system -- a system with greater capacity and a sound financial base; a system that supports our national goals in the areas of safety, national security, environmental amenity, and accessibility for all.

The people we heard echoed the words of President Bush that "we are ready to make an investment in America's future." An investment in transportation is an investment in our future economy, in jobs.

The National Transportation Policy we unveiled today provides a strategic framework for that national investment of time, of money, and of commitment. It shapes the movement of passengers and goods in the 1990's and beyond.

Simply speaking, the National Transportation Policy is about using our common sense -- doing the right things with our limited resources -- focusing on systems of national significance and promoting national priorities -- improving mobility, the efficient movement of goods, providing jobs and improving the quality of life for all Americans.

We deliberately structured the policy to be intermodal in nature-- driven by the freedom of the marketplace and focused on moving America toward a transportation system that promotes U.S. competitiveness both at home and abroad. Its long-range strategy

guidelines emphasize increased private sector transportation investment and job-producing economic growth.

The policy has six major themes: one, maintaining and expanding the existing transportation system; two, providing a sound financial base for transportation programs; three, maintaining a strong and competitive transportation industry; four, ensuring public safety and national security; five, enhancing the environment and the quality of life for our citizens; and six, advancing transportation technology into the 21st century.

This document is not the conclusion of a project, but the beginning of a new era and an ongoing process in which you, of course, will have a major role. The Policy has given us a long-term vision for the future and a short-term decisionmaking framework for major initiatives. Let me give you some examples:

One, we soon will be forwarding the Federal Aviation Administration Reauthorization bill to Congress. That bill includes an increase of more than 70 percent for the Federal Aviation Administration's capital and R & D programs over the next five years compared to the last five, and a provision allowing local airports to levy a passenger facility charge to support airport development. And, yes, we are proposing an increase in the aviation user fee to support these increased levels of Federal spending on aviation infrastructure. The Congress' willingness to enact such an increase will be an important demonstration that our

national leadership is committed to meeting the nation's transportation infrastructure needs.

Two, we are using this policy as the basis for preparing our reauthorization proposal for the highway, transit and highway safety programs in 1991 and other near-term legislative initiatives such as eliminating remaining economic regulation of trucking. This policy is also the umbrella for a law enforcement safety summit on April 1, and oil spill initiatives to protect the environment and prevent another disaster such as Exxon Valdez.

Three, we have asked for a budget increase of 17 percent in Fiscal year 1991 for research and development in areas such as maglev as an alternative transportation mode, and intelligent vehicles and highways that use advanced electronic and communications technology to facilitate movement of people and goods.

Four, we have adopted a program that will enable foreign air carriers to provide improved international air service to more cities. Further opening up the skies in international aviation will produce economic growth.

Among the 169 guidelines and 65 legislative, regulatory and program objectives in the policy are long-term goals that will help to preserve transportation facilities currently in place; expand essential capacity; close the gaps in the transportation network; promote effective connections between rural and urban

areas, between ports and inland points, and between modes; maintain the integrity of the trust funds, and ensure that all transportation user fees are spent for their intended purpose -- to improve transportation; and promote sounder management of our transportation systems.

Finally, the policy urges greater flexibility for state and local governments to raise revenues -- for example, collecting tolls on highways; and encouraging greater private investment in transportation.

The policy supports certain goals: We must eliminate remaining economic regulation of trucking and strive for uniformity of state regulations. We must remove inequitable labor requirements that limit productivity in the railroad industry. We must strive to maintain a high level of safety at all times in all modes. In aviation safety, in highway safety, in boating safety, and the transportation of hazardous materials, the policy provides a framework for action.

In my mind, there is no question that improved transportation will improve our productivity as a nation -- that an investment in infrastructure is an investment in jobs. I know that today is the kick-off of your Committee's hearings on the reauthorization of the federal-aid highway, transit and highway safety programs. Inadequate maintenance and inefficient use of the transportation infrastructure reduce the capacity of the system and contribute to

congestion. Expanding capacity will certainly be necessary in some areas; in many other areas, we must make better use of existing transportation facilities. For example, with low-occupancy automobiles playing such a large part in traffic congestion in urban and intercity travel, we must take greater advantage of the potential of bus, rail and ridesharing if we are to reduce crowding, delays, and "gridlock."

Your Committee is interested in "proposals to meet the transportation needs of Commerce in the 1990's and the 21st century" and a "fresh perspective" on the transportation program at the end of the interstate highway construction program. We trust that our National Transportation Policy will meet your expectations. Now let me briefly outline the Policy's principles that we intend to encompass in the Surface Transportation Reauthorization proposal.

Regarding highways and highway safety, the new program would:

- Make use of the Highway Trust Fund to address critical highway infrastructure requirements.
- Focus the Federal-aid highway program on systems and projects of national significance.
- Provide Federal funding incentives for preservation of highways of national significance.
- Require sound infrastructure management programs as a condition for Federal-aid.
- Increase the State and local share on Federal-aid projects.

- Allow greater flexibility in the use of Federal trust funds for highway and transit purposes.
- Allow greater use of toll financing for Federal-aid highways.
- Devote additional resources to research and development, including programs to improve highway safety through human factors research, and seed money for private sector or State and local research on new transportation technologies, such as intelligent vehicle/highway systems.
- Improve highway and motor carrier safety by targeting Federal financial support and technical assistance to promote enactment and more effective enforcement of laws governing speed limits, driving under the influence of alcohol or drugs, truck driver qualifications and vehicle maintenance, and use of safety belts, child safety seats, and motorcycle helmets; and increase public awareness in those areas.

Regarding mass transit, there are changes that should be made in the current mass transit assistance program, and the policy will lead us toward them: increased emphasis on formula distribution and less reliance on discretionary allocation to permit more confident planning at the local level; an enhanced local commitment to mass transit; flexibility between highway and transit programs in a number of categories; and an appropriate emphasis on research, technology and training to facilitate the development of the latest techniques and best trained people to

provide safe, efficient, attractive, comfortable and convenient mobility for everyone.

To implement the national transportation policy for mass transportation, the Administration will develop legislation consistent with the following principles:

- o Restructure the Federal mass transportation assistance programs to improve effectiveness and reduce reliance on the General Fund.
- o Eliminate barriers to private sector participation in financing and operating mass transportation systems.
- o Allow greater flexibility in the use of Federal trust funds for highway and transit purposes.
- o Increase the State and local role in managing and administering Federal funds.

President Bush spoke about the National Transportation Policy in his State of the Union message last month, stating that "it's time to act." He emphasized "that it's time to act <u>together</u>." Suffice it to say that I am very pleased to end an exciting day in the presence of this Committee. Today is the culmination of a lot of hard work and study by the Department's staff. We are eager to share our early thoughts about the task that lies ahead for all of us.

My colleagues and I will be pleased to answer your questions at this time and I look forward to working closely with all of you as we "act together."

* * *

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

TUESDAY, MARCH 13, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, DC.

The subcommittee met, pursuant to recess, at 10:13 a.m., in room 2167, Rayburn House Office Building, Hon. Norman Y. Mineta (chairman of the subcommittee) presiding.

Mr. MINETA. The Subcommittee on Surface Transportation will come to order.

At this time we will be continuing the hearings that began last Thursday with the appearance before the subcommittee of Secretary Skinner of the Department of Transportation with his colleagues from NHTSA, UMTA, and from the Federal Highway Administration.

Frankly, as I have indicated on a number of occasions, I am proud to be chairing this subcommittee with the good help of our Republican ranking member, Bud Shuster of Pennsylvania, Glenn Anderson of California on the full Committee on Public Works and Transportation, and Congressman John Paul Hammerschmidt of Arkansas.

Now that we have a national transportation strategy it is a good starting point for where we go in terms of what we want that post-interstate era to look like. So we have before us a number of our colleagues who would have suggestions on how to improve our infrastructure and national highway transportation system.

I am pleased to welcome before us Congressman Frank McCloskey and Congressman Lee Hamilton of Indiana; as well as Congressman Jim Chapman of Texas, our fine former colleague who is now on the very important Appropriations Committee; our colleague from Virginia, Congressman Frank Wolf, a fine member of the Appropriations Committee.

At this time let me just indicate that I did have a call from the Governor of Indiana indicating that because of the last day of the legislature he would not be able to be here. We will go ahead and have you proceed in your own fashion.

Before you proceed let me ask my fine colleague, Mr. Shuster, if he has any opening statement.

Mr. SHUSTER. Thank you very much, Mr. Chairman.

I simply want to associate myself with your remarks and welcome our fine colleagues to the subcommittee. Also, I'd ask unani-

mous consent that an opening statement by Congressman Hammerschmidt be placed in the record.

Mr. MINETA. Without objection, so ordered.

Mr. SHUSTER. Thank you, Mr. Chairman.

[Mr. Hammerschmidt's prepared statement follows:]

STATEMENT OF HON. JOHN PAUL HAMMERSCHMIDT

Thank you Mr. Chairman: I would like to commend you, Mr. Chairman and Congressman Shuster, for scheduling this second day of hearings to examine issues underlying reauthorization of the Federal Highway and Mass Transit Programs.

Secretary Skinner's overview of the national transportation policy last week was a fitting start of this series of hearings. I know that many of the groups appearing before the committee today actively participated in Secretary Skinner's outreach program.

Your contributions to the surface transportation policy-making process went well beyond that, however. Some associations have been active for more than 2 years in trying to indentify our Nation's mobility needs and the policies that will ensure we can meet them. You have have worked, first, toward a consensus among your own members, and then gone beyond the share your ideas with the whole of the transportation community.

The product of your efforts is very welcome in this committee today. I know that I am joined by my colleagues in looking forward to hearing your recommendations.

I want to extend a warm welcome to my congressional colleagues, as well, and let you know that this committee is anxious to hear your suggestions and to work with you to shape the future of our highway and transit programs.

Mr. MINETA. At this time let me turn to our colleague, Frank McCloskey, of Evansville, Indiana. He, like I, has served in another capacity before coming here to Congress, and that was as the mayor of a city. I was mayor of San Jose, and Frank was mayor of Evansville, Indiana. So let me, at this time, turn over the time to our colleague, Congressman McCloskey.

TESTIMONY OF HON. FRANK McCLOSKEY AND HON. LEE H. HAMILTON, U.S. REPRESENTATIVES FROM THE STATE OF INDIANA

Mr. McCLOSKEY. Mr. Chairman, we do have a Frank that is the mayor of Evansville. His name is McDonald. I was at the other end of the district up in Bloomington.

Mr. MINETA. I'm sorry. Bloomington.

Mr. McCLOSKEY. They are two key cities obviously in Southwestern Indiana, and obviously very, very important and desirous of the project we are going to talk about today.

I want to thank you, also, for your generosity in hearing my distinguished colleague, Lee Hamilton, and myself out on this needed project. As you know, Mr. Mineta, you displayed the generosity to talk with me about this project several times and you have had several meetings with our governor.

As you said, Governor Bayh cannot be here today. He sees this as a priority meeting, but it is the last day of, quite frankly, a very tumultuous legislature, so he had to stay in Indiana.

If it is permissable, I would like to submit his written remarks for the record, and also the remarks of our good mayor of Evansville, Frank McDonald.

Mr. MINETA. Without objection, so ordered.

Mr. McCLOSKEY. Thank you, sir.

[The prepared statement of Governor Bayh appears on p. 279.]

[The prepared statement of Mr. McDonald appears on p. 374.]

Mr. McCloskey. Very briefly, for a project of this sort and this priority I think a public official—at least most of us—only gets involved with perhaps one or two projects of such scope in a lifetime. I would like to read my full remarks for the record, but, to capsulize, as many members of the committee know, we are talking about the possibility of an interstate highway-type connector between Indianapolis and Evansville in Southwestern Indiana.

Very simply speaking, if you look at the present interstate highway system in that area, there are adequate east-west interstates, there are adequate north-south interstates all over the state. But, indeed, the southwestern area, as far as any north-south spoke, has been left out. It is one vast void as far as north-south transportation, and also basic transportation from Evansville to Indianapolis both ways, and also negatively affecting many, many communities along the way.

The southwestern area of Indiana includes Evansville, the third largest city in the State, and, as I have said, Bloomington, the home of Indiana University. It has experienced declining employment and loss of major businesses in the last several years. Some parts of the region have lagged behind the rest of the area in the economic rebound of recent years, even though the area is the gateway to the midwest.

Part of the problem is the lack of a major connector highway linking Southwestern Indiana with our State capital. While there are interstate or four-lane highways running east to west and north to southeast, there is not a major throughway connecting Indianapolis and Central Indiana with the southwest portion of the State where Indiana, Kentucky, and Illinois meet. This serves to isolate the southwest portion of the State from other areas of Indiana.

Looking at a map of the area, it appears that when the interstate system was designed, a spoke of the wheel was omitted. There are direct interstate routes from all corners of the State to the center, except for the southwest corner. Interstate 69 begins north of Detroit and terminates in Indianapolis. From Indianapolis, the interstate highway system continues southeast on I-65 and west on I-70.

The residents of Evansville can travel easily by Interstate 64 east to Louisville and west to St. Louis, but cannot, by direct route, get to the capital of their own State. Those communities are closer by road time to Evansville than the capital of their own State.

Travel from Indianapolis to areas in the southwestern part of the State can only be accomplished by traveling on a number of two-lane rural roads, which is made more difficult by narrow bridges, railroad crossings, and having to pass through small communities where a residential speed limit prevails. In essence, there is no direct route. Not only is this time consuming, but it creates serious safety hazards for both drivers and residents of small communities.

The regional picture is even more graphic. A considerable portion of the midwest and central south is deprived of adequate north-south access. This area includes Michigan, Northern Ohio, Illinois, Western Kentucky, Western Tennessee, Eastern Arkansas, Western Mississippi, and Central Louisiana. Travel between Memphis, Tennessee, and Detroit, Michigan, for example, would be greatly improved by the construction of this project. With that in

mind and with our basic concept, this should be a regional and national priority.

Just yesterday I was very pleased to receive a call from the AAA Motor Club in Southern Indiana. The AAA in Southern Indiana has informed us that seven AAA clubs, with a total of more than 2.8 million members, have officially agreed to support our efforts to build such a highway. The AAA clubs supporting the highway proposals are those in Chicago, Eastern Kentucky, Northern and Southern Indiana, Tennessee, and Michigan, as well as—a little international flavor here—the club across the Canadian border in Windsor, Ontario.

The lack of an adequate north-south highway route in this region of the country has been apparent for more than 40 years. According to a joint highway research project conducted by Purdue University and the Indiana State Highway Commission back in the late 1940s, the State Highway Department proposed a route linking Indianapolis and Evansville at that time. It was envisioned the highway would continue through Kentucky on the then-proposed Interstate 24, and from there on to Nashville.

I ask unanimous consent that I be permitted to submit a copy for the record of a map of the area with the current interstate highways highlighted.

All areas between Indianapolis and Evansville would benefit economically through improved access to these cities. The lack of a highway linking Evansville to Indianapolis has been a severe detriment to economic growth in our area. Many businesses have told me they have been reluctant to locate in the area because of the transportation problems. Other economic sectors, such as agriculture, have been constrained by lack of a satisfactory north-south highway route.

Local companies have said the highway would allow them to reach their current markets and suppliers in Indianapolis and Fort Wayne more readily, as well as to expand their marketing areas beyond the State's borders to such areas as Michigan, Western Tennessee, Eastern Arkansas, Western Mississippi, and Central Louisiana.

It is not just local companies that would benefit. National companies with establishments in the area have stressed the importance of quality interstate transportation.

In addition, the highway would provide improved access to educational institutions, recreational facilities, and cultural attractions throughout the State and region. Moreover, the highway will ensure that the area will be better served during medical emergencies and natural disasters.

Earthquakes have been in the news lately. Not many people know that the Evansville area and areas of Illinois and Missouri atop the New Madrid Seismic Zone are said to be as much in peril as many areas of California or elsewhere. The largest quake in the continental United States occurred along that fault in 1812. Unfortunately, geologists say that a very large quake of San Francisco area or worse proportions is likely—quite possibly by the end of this century. Obviously, such a highway could be vital to the area's immediate and long-range safety and recovery.

The benefits of building a highway linking Indianapolis and Evansville could go well beyond the advantages it would bring to the State of Indiana. For example, Western Kentucky—the Henderson and Owensboro areas—would receive widespread benefits from a highway linking Evansville and Indianapolis. Henderson County is just over the border from Evansville. That area is a hub of sub-assemblers for the auto industry—especially plastics. In fact, the area has come to be known as "Plastics Valley."

Currently, trucks leaving Henderson County travel to Northern Indiana and Michigan on U.S. 41, which is considered to be unsafe by many trucking firms. The alternate route, I-64 to Louisville and then I-65 to Indianapolis, is roundabout.

In addition, the auto industry places great emphasis on punctual delivery of parts by sub-assemblers. The currently available routes from Henderson County to Michigan are neither expedient nor reliable. Improved transportation would greatly benefit these Henderson County sub-assemblers. This is just one example of out-of-State benefits which an Indianapolis-to-Evansville highway would bring.

Local and State interest in this highway project is great. As I have said, Governor Evan Bayh is a strong supporter of this concept. He would have been here today, as I have said. His statement is in the record, but to quote partly from his statement, the proposed highway linking Evansville to Indianapolis "is a perfect example of how a strong Federal/State partnership in highway development can provide a much-needed and well-deserved transportation artery for the citizens of not only Indiana, but the entire region and nation."

The Governor also points out that the highway will provide much-needed rural access and will encourage economic development. The Governor said he hopes that the Indianapolis-to-Evansville highway could serve ultimately as a major link to effectively extend I-69 from Northern Michigan through the heartland to Memphis.

He has put the State's money, as far as he is concerned, where his mouth is. He has proposed to use in excess of a quarter of a billion dollars in Hoosier lottery profits and other State funds to construct a significant new four-lane segment of the route between Bloomington and Petersburg. The Governor has directed the Indiana Department of Transportation to immediately undertake location and preliminary environmental studies at an estimated cost of more than $3 million on the segments between Evansville and Bloomington.

Also, National Transportation Secretary Skinner, after various conversations with Governor Bayh, has indicated a positive attitude toward this highway. Secretary Skinner told the Governor that such a highway has "a legitimate chance of getting significant Federal funding" if the State stands ready to contribute funds towards the building of the highway.

The Governor does feel—and it is my feeling, also—an overwhelming majority of the General Assembly plans to invest in such a highway.

In addition to the Governor's support, the highway has received bipartisan support from members of the State legislature and, as I have indicated, numerous elected officials.

In addition to governmental support for the highway, residents of Southwestern Indiana have had their say at numerous public meetings. More than 3,500 people attended a series of such meetings, and they were overwhelmingly in favor of such a highway.

Mr. Chairman, I thank you very much for your generosity and your interest in this project so far. We know just how difficult a project of this magnitude is. Your positive interest and consideration and that of the subcommittee is so much appreciated.

Thank you very much.

Mr. MINETA. Thank you very much, Mr. McCloskey.

At this time let me turn to your colleague, Congressman Hamilton.

Mr. HAMILTON. Thank you very much, Mr. Chairman, Mr. Shuster, and members of the committee.

Mr. Chairman, I know you want me to be brief. Mr. McCloskey has set out very well the case for this highway. I do ask unanimous consent that my statement be included in the record.

Mr. MINETA. Your prepared statement will appear in the record following your oral remarks.

Mr. HAMILTON. Mr. McCloskey and I very much appreciate the very careful consideration that you are giving our request. We know something of the tremendous demands upon the members of this committee and the very balanced way that you approach the national transportation needs.

I, of course, support fully Frank McCloskey's statement in support of the highway. I confess to you that I have a very special interest in this project because Evansville is my home town.

The standing comment in Indiana is how difficult it is to get to Evansville. Indeed, you often hear the comment that "You can't get to Evansville from here." That's a kind of standard joke that I guess is true of many places in the country. It is certainly true of Evansville.

Evansville is one of the leading cities, not just in Indiana, but in what we call the Tri-State Area—Illinois, Indiana, and Kentucky—and it is a considerable handicap to the people of Indiana that we cannot get to Evansville easily. There is no direct link between Indianapolis, the State capital, and Evansville, which is clearly one of the leading and major cities of our State.

Let me just say that the State of Indiana has committed themselves solidly to this project. They have already appropriated money for some of the appropriate studies that have to be made. And it has marvelous support not just in the area that Frank McCloskey represents, which includes Evansville and Southwestern Indiana, but has very strong support in my part of the State in the southeastern part, as well as all segments of the State so far as we are able to determine. Local and State support, then, as well as private support, is very, very strong, indeed.

The objectives are the north-south corridor, not only in Indiana but in the Central United States. This would be a most important link connecting Detroit to Memphis, for example, and it is needed to accommodate—and this is an additional point to what Frank said—the projected rapid growth in Southern Indiana over the next several decades.

Evansville will grow. So will certain other counties, growth centers in our State. It is important that we link these growth centers in our State, as this highway does.

So, Mr. Chairman, we are very grateful to you for your consideration. We are asking you to authorize Federal funding as you consider the 1991 Surface Transportation Authorization Act. We thank you for your consideration of our request.

Mr. MINETA. Thank you very much, Congressman Hamilton.

Let me ask of your colleague, Mr. McCloskey—I know that the State of Indiana has committed a significant amount of its funds for the construction of this interstate-type highway in the southwestern part of the State. Without the availability of additional Federal funds for the construction of this project, will the State of Indiana be able to complete this project?

Mr. MCCLOSKEY. I would say, Mr. Chairman, it would be exceedingly difficult. I would not say impossible. To be quite candid, I guess on the good news side the State administration has indicated in various remarks that no matter what they plan to do a significant highway upgrade, and particularly four-laning along those lines. But it would be much more difficult and much more long awaited if we do not have significant help. Indeed, as I have indicated and we have talked about it, if you look at the regional and national impact of such a highway up and down the central United States from Detroit to Louisiana, I would hope that it could be considered for interstate authorization. That is our hope.

But they realize, no matter what, there is a void there. That is what I am hearing from the State Transportation Department.

Mr. MINETA. Mr. Hamilton, the committee has received testimony in support of adding segments to the existing interstate system. However, with the soon-to-be-completed interstate system in place, the focus in the Congress will be on preserving the existing system and also on adding additional capacity in areas that are not presently being served by the interstate highway system.

With regard to this specific project, are there significant economic benefits to be derived by the construction of this project?

Mr. HAMILTON. Absolutely, Mr. Chairman. There is no doubt in my mind about that at all.

You understand, I'm sure, that Southern Indiana is basically a rural area. We do not have large cities. One of the characteristics of rural areas is that you need certain areas that generate growth.

What we would be doing by this highway would be to link areas of economic vitality in our State and expand economic opportunities significantly. We would be linking Evansville, which is one of those areas of growth, with the region of several counties in the Southwestern and Southwestern-Central Indiana, and so economic growth would be greatly enhanced by these developments.

May I Give you one example of how important these highways are?

Mr. MINETA. Sure.

Mr. HAMILTON. Not long ago Walmart, which is expanding very rapidly into Indiana, as well as to other States, came to me and said they wanted to put a distribution center—a very, very large distribution center—in Southern Indiana. I said, "Where do you want to put it?" They said, "We want to put it on I-65," which is

one of the major interstates in our State. I said, "How far off I-65 do you want to put it?" Their answer was ten feet.

They have now put a huge distribution center with hundreds and hundreds of jobs in Southern Indiana—Seymour, Indiana. It is there because of the highway.

These highways, as you know better than anybody in this Congress, generate tremendous economic growth and opportunity.

Mr. McCloskey. Mr. Mineta, if I might add to that, I'm pleased that Mr. Hamilton answered that question so eloquently. I have never told Lee this but, just talking to some of our area leadership, most experts in economic development, for example, and Hoosier Energy, they told me, "Frank, we can show you where the businesses are going along the interstate in Lee's district, but they are not going anywhere in your district." So Lee is very generous in backing of the Hoosier State to be here.

But in answer to your specific question about economic benefit, yes, Mr. Chairman, there are studies, and a very detailed study which this committee and the Appropriations Committee cooperated in, showing a positive economic benefit not as high as some would like, in the area of a range of a realistic $1.23 to an optimistic $1.54. However, a recent professional and technical critique and update of that prepared by a Maryland firm suggested that a better analysis would change the benefits per dollar from $2.02 to $2.39.

I think it is very good and vital information but, quite frankly, I don't think, when you look at the area patterns and the interstate patterns, you need a technical study, as such, to see the need for this highway.

But yes, sir, there are various studies showing positive economic benefit.

Mr. Mineta. Thank you very much.

Mr. Shuster.

Mr. Shuster. Thank you very much, gentlemen. I certainly welcome my colleagues here today.

Looking at the four stages of this proposed new interstate, Indianapolis to Bloomington has a preliminary cost of $152 million. How many miles are we talking about in each one of these segments?

Mr. McCloskey. I don't have it broken down right now by segment, Mr. Shuster. I could get that for the record. But we're talking roughly 120 to 130 miles.

Mr. Shuster. All four together——

Mr. McCloskey. Right.

Mr. Shuster [continuing]. Are 130 miles. Okay.

Mr. McCloskey. And some of it would be, in essence, new construction—particularly from north of Evansville to Washington, Indiana, along the present general routing of Highway 57. And there would be brand-new highway going through Green County connecting to Bloomington, but that would—the Indianapolis-Bloomington leg would be essentially an update of the present four-lane Indiana 37 which serves Indianapolis, Bloomington, and Indiana University.

Mr. Shuster. Would you have a rough idea of how many miles would be in the Petersburg to Evansville link?

Mr. McCloskey. I think we're looking at about 60 to 70 miles there.

Mr. Shuster. So of the total 130 miles, half of that is the Petersburg to Evansville?

Mr. McCloskey. I would say more than half of it would be Evansville to north of Washington, Indiana, which is in Davies County hitting Green County.

Mr. Shuster. So just in rough numbers—I'm trying to get a handle on the total cost, and you have cost estimates here for everything except that last one. If the cost of everything but the last one is $387 million and the last one is greater than the sum of all the others, you are looking at $700 million, $800 million, or $900 million.

Mr. McCloskey. You are looking in the area of $800 million, Mr. Shuster.

Mr. Shuster. Right. So we are talking big bucks.

Mr. McCloskey. We are talking very big bucks. As I have said, most normal public officials only get involved with a project of this scope once or twice in a lifetime, but it is needed.

Mr. Shuster. One of the things that we are considering as we move from the post-interstate era is a new category called "highways of national significance, national highway system." If we should find ourselves going in that direction, certainly this would be a candidate for that category.

Mr. McCloskey. We appreciate that, sir.

Mr. Shuster. But I am almost certain that we are not going to find ourselves funding these projects at the 90 percent level.

Mr. McCloskey. I understand that.

Mr. Shuster. So I think it is—I guess I'm trying to give you a heads up and your Governor a heads up in terms of it taking a very substantial match of——

Mr. McCloskey. There is a very significant State commitment, which I think the subcommittee is well aware of.

Mr. Shuster. Right. Thank you very much.

Mr. McCloskey. I appreciate your consideration, again. Thank you.

Mr. Mineta. Mr. Valentine.

Mr. Valentine. Thank you, Mr. Chairman.

Did I understand you to say that the cost of approximately $800 million would be the total cost of construction, or just the cost to the Federal Government?

Mr. McCloskey. No. The total cost of construction of Indianapolis to Evansville.

Mr. Valentine. If this section of road is undertaken, if this project is put in the bill, would the effect be that the State of Indiana would receive, in addition to its normal fair share of money from the trust fund and other sources based on the formula, an additional $800 million?

Mr. McCloskey. No. Not an additional $800 million, but whatever the Federal share would be combined with the State share. I know the State would plan to expend hundreds of millions of dollars on this. We are looking for the help we can get.

Mr. Valentine. But this would be in addition to what the State of Indiana would receive without this project?

38-253 O—91——4

Mr. McCloskey. I would assume we are talking about hopefully more than half of the cost of the project additionally. Yes, sir.

Mr. Valentine. What is the gasoline and fuel oil tax in Indiana? How much is it?

Mr. McCloskey. I believe, as I recall, it is $0.09, Mr. Valentine.

Mr. Valentine. Yes. Is there——

Mr. McCloskey. I would say for the record that the $800 million is a very rough figure. It has been estimated at less than that. Again, the State's share would be subtracted from that, so we are not asking for $1 billion from the Federal Government for this. I'd like to back us away from any idea like that.

Mr. Valentine. Yes. Is there any special reason why, with the 30 years of the construction of the interstate system, that this need was not met?

Mr. McCloskey. Sir, quite frankly, I have asked that question several times, Mr. Valentine. We are researching it. I just don't know. Right now it is lost in the annals of Hoosier and national history. I'm sure with better research we could find out. I have asked several times. But if you do look at it, you just know there is a gap. It just leaps out at you.

What I am most heartened by is all these State AAAs on their own getting in touch with us saying regionally we need to do this. They were just coming in yesterday.

Mr. Valentine. One final question, Mr. Chairman.

Would a toll road be a feasible answer to part of this problem?

Mr. McCloskey. I would say it should not be ruled out. Everyone is open to all funding ideas.

Mr. Valentine. If you decide——

Mr. McCloskey. It would not be my preferred way, but I would not rule it out, and I don't think the State administration would, either.

Mr. Valentine. If you decide to pursue that you might confer with our colleague from Virginia, because the Richmond-Petersburg Turnpike, which I use frequently, is the most lucrative section of toll road in the United States. You might find out how he arranged to get that on the interstate system and keep it there.

Thank you, Mr. Chairman.

Mr. McCloskey. I was wondering if the chairman could—Mr. Mineta, would it be possible to comment briefly on a mutual hope that the Interstate Trust Fund could be off the Federal budget enough to allow an increase in disbursements rather than, as President Bush suggested, an 8 percent cut?

Mr. Mineta. Well, as you are very well aware, in September of 1987 this committee, the House Committee on Public Works and Transportation, attempted to take the Aviation Trust Fund off budget. At that time we lost it—211 yes, 216 no.

I think there is an interest on the part of the committee leadership to do something similar in terms of both the Aviation Trust Fund and the Highway Trust Fund on that issue.

If we are successful in doing that, we would have to couple it with making sure that the Gramm-Rudman-Hollings provisions do no apply against the trust fund amounts. Yes, are we interested in doing that? Absolutely.

In the absence of taking the trust funds of-budget, we would like to draw down against the unapportioned and unobligated surplus in the trust fund.

Mr. McCloskey. I think you are going to get increased and enthusiastic support for those goals, Mr. Chairman. I know that is going around the House now.

Mr. Mineta. It is always amazing how those who didn't support us in September of 1987 suddenly are advocates of the program now that they do have some interest in what we are doing here. I'm not saying that of the members of this panel, but of the members of the House.

Mr. McCloskey. Right.

Mr. Mineta. Mr. Bosco.

Mr. Bosco. Thank you, Mr. Chairman.

I would only thank our colleagues from Indiana and say that I hope that as we literally begin the hearings on the reauthorization that we do take into account what Members of Congress ask us to do. I know that some in the press and around the country have almost caused us to believe that we shouldn't listen to our elected colleagues in apportioning highway trust funds—it somehow is better to give these funds to bureaucrats and bureaucracies in the States and God forbid that we should take into account what elected Members of Congress would want in their districts or in their States.

I feel just the opposite. I think when Members of Congress come before us with worthwhile projects such as this that those projects should go right to the top of the list. I, for one, am going to be guided by that principle.

Mr. McCloskey. Thank you very much, Mr. Bosco.

Mr. Mineta. Mr. Boehlert, did you have any comments?

Mr. Boehlert. No.

Mr. Mineta. Mr. Laughlin.

Mr. Laughlin. No questions.

Mr. Mineta. Mr. Clement.

Mr. Clement. No questions.

Mr. Mineta. Mr. Sangmeister.

Mr. Sangmeister. No questions.

Mr. Mineta. Mr. Payne.

Mr. Payne. No questions.

Mr. Mineta. Well, let me thank our distinguished colleagues from Indiana for their presentation.

Mr. McCloskey. Thank you, Mr. Chairman.

Mr. Hamilton. Thank you, Mr. Chairman.

[Mr. McCloskey's prepared statement follows:]

TESTIMONY OF CONGRESSMAN FRANK McCLOSKEY
BEFORE THE HOUSE SUBCOMMITTEE ON SURFACE TRANSPORTATION
MARCH 13, 1990

I WOULD LIKE TO THANK CHAIRMAN MINETA AND THE MEMBERS OF THE SUBCOMMITTEE FOR THIS OPPORTUNITY TO TESTIFY ABOUT A PROJECT OF GREAT IMPORTANCE TO SOUTHWESTERN INDIANA AND OUR ENTIRE REGION OF THE NATION. I AM PLEASED MY DISTINGUISHED COLLEAGUE LEE HAMILTON IS HERE, AND APPRECIATE HIS SUPPORT.

THE SOUTHWESTERN AREA OF INDIANA, WHICH INCLUDES EVANSVILLE, THE THIRD LARGEST CITY IN THE STATE, AND BLOOMINGTON, THE HOME OF INDIANA UNIVERSITY, HAS EXPERIENCED DECLINING EMPLOYMENT AND THE LOSS OF MAJOR BUSINESSES IN THE PAST SEVERAL YEARS. SOME PARTS OF SOUTHWESTERN INDIANA HAVE LAGGED BEHIND THE REST OF THE REGION IN THE ECONOMIC REBOUND OF RECENT YEARS, EVEN THOUGH THE AREA IS AT THE GATEWAY TO THE MIDWEST. PART OF THE PROBLEM IS THE LACK OF A MAJOR CONNECTOR HIGHWAY LINKING THE MAJOR CITIES OF SOUTHWESTERN INDIANA WITH THE STATE CAPITAL, INDIANAPOLIS.

WHILE THERE ARE INTERSTATE OR FOUR-LANE HIGHWAYS RUNNING EAST TO WEST AND NORTH TO SOUTHEAST, THERE IS NOT A DIRECT MAJOR THROUGHWAY CONNECTING INDIANAPOLIS AND CENTRAL INDIANA WITH THE SOUTHWEST PORTION OF THE STATE, WHERE INDIANA, KENTUCKY AND ILLINOIS MEET. THIS SERVES TO ISOLATE THE SOUTHWEST PORTION OF THE STATE FROM OTHER AREAS OF INDIANA.

LOOKING AT A MAP OF THE AREA, IT APPEARS THAT WHEN THE INTERSTATE SYSTEM WAS DESIGNED, A SPOKE OF THE WHEEL WAS OMITTED. THERE ARE DIRECT INTERSTATE ROUTES FROM ALL CORNERS OF THE STATE TO THE CENTER, EXCEPT FOR THE SOUTHWEST CORNER. INTERSTATE 69

BEGINS NORTH OF DETROIT AND TERMINATES IN INDIANAPOLIS. FROM INDIANAPOLIS, THE INTERSTATE HIGHWAY SYSTEM CONTINUES SOUTHEAST ON I-65 AND WEST ON I-70.

THE RESIDENTS OF EVANSVILLE CAN TRAVEL EASILY BY INTERSTATE 64 EAST TO LOUISVILLE, KENTUCKY AND WEST TO ST. LOUIS, MISSOURI, BUT CANNOT, BY DIRECT ROUTE, GET TO THE CAPITAL OF THEIR OWN STATE. TRAVEL FROM INDIANAPOLIS TO AREAS IN THE SOUTHWESTERN PART OF THE STATE CAN ONLY BE ACCOMPLISHED BY TRAVELING ON A NUMBER OF TWO-LANE, RURAL ROADS, WHICH IS MADE MORE DIFFICULT BY NARROW BRIDGES, RAILROAD CROSSINGS AND HAVING TO PASS THROUGH SMALL COMMUNITIES WHERE A RESIDENTIAL SPEED LIMIT PREVAILS. NOT ONLY IS THIS TIME CONSUMING, BUT IT CREATES SERIOUS SAFETY HAZARDS FOR BOTH DRIVERS AND RESIDENTS OF THE SMALL COMMUNITIES.

THE REGIONAL PICTURE IS EVEN MORE GRAPHIC. A CONSIDERABLE PORTION OF THE MIDWEST AND CENTRAL SOUTH IS DEPRIVED OF ADEQUATE NORTH-SOUTH ACCESS. THIS AREA INCLUDES MICHIGAN, NORTHERN OHIO, ILLINOIS, WESTERN KENTUCKY, WESTERN TENNESSEE, EASTERN ARKANSAS, WESTERN MISSISSIPPI, AND CENTRAL LOUISIANA. TRAVEL BETWEEN MEMPHIS, TENNESSEE AND DETROIT, MICHIGAN, FOR EXAMPLE, WOULD BE GREATLY IMPROVED BY THE CONSTRUCTION OF THIS PROJECT.

JUST YESTERDAY, I RECEIVED A CALL FROM THE AAA MOTOR CLUB IN SOUTHERN INDIANA SAYING THAT SEVEN AAA CLUBS WITH A TOTAL OF MORE THAN 2.8 MILLION MEMBERS HAVE OFFICIALLY AGREED TO SUPPORT OUR EFFORTS TO BUILD A HIGHWAY LINKING INDIANAPOLIS TO SOUTHWEST INDIANA. THE AAA CLUBS SUPPORTING THE HIGHWAY PROPOSAL ARE THOSE IN CHICAGO, EASTERN KENTUCKY, NORTHERN AND SOUTHERN INDIANA,

TENNESSEE AND MICHIGAN, AS WELL AS THE CLUB LOCATED JUST OVER THE CANADIAN BORDER FROM DETROIT IN THE CITY OF WINDSOR IN ONTARIO PROVINCE.

THE LACK OF AN ADEQUATE NORTH-SOUTH HIGHWAY ROUTE IN THIS REGION OF THE COUNTRY HAS BEEN APPARENT FOR MORE THAN FORTY YEARS. ACCORDING TO A JOINT HIGHWAY RESEARCH PROJECT CONDUCTED BY PURDUE UNIVERSITY AND THE INDIANA STATE HIGHWAY COMMISSION, IN 1947 THE INDIANA STATE HIGHWAY DEPARTMENT PROPOSED A ROUTE LINKING INDIANAPOLIS AND EVANSVILLE. AT THAT TIME, IT WAS ENVISIONED THAT THE HIGHWAY WOULD CONTINUE THROUGH KENTUCKY ON THE THEN-PROPOSED INTERSTATE 24, AND FROM THERE ON TO NASHVILLE.

I ASK UNANIMOUS CONSENT THAT I BE PERMITTED TO SUBMIT FOR THE RECORD A COPY OF A MAP OF THE AREA WITH THE CURRENT INTERSTATE HIGHWAYS HIGHLIGHTED.

ALL AREAS BETWEEN INDIANAPOLIS AND EVANSVILLE WOULD BENEFIT ECONOMICALLY THROUGH IMPROVED ACCESS TO THESE CITIES. THE LACK OF A HIGHWAY LINKING EVANSVILLE TO INDIANAPOLIS HAS BEEN A SEVERE RETARDANT TO ECONOMIC GROWTH IN SOUTHWESTERN INDIANA.

A NUMBER OF BUSINESSES HAVE BEEN RELUCTANT TO LOCATE IN THE AREA BECAUSE OF THE TRANSPORTATION PROBLEMS. OTHER ECONOMIC SECTORS, SUCH AS AGRICULTURE, HAVE BEEN CONSTRAINED BY THE LACK OF A SATISFACTORY NORTH-SOUTH HIGHWAY ROUTE.

LOCAL COMPANIES HAVE SAID THAT THE HIGHWAY WOULD ALLOW THEM TO REACH THEIR CURRENT MARKETS AND SUPPLIERS IN INDIANAPOLIS AND FT. WAYNE MORE READILY, AS WELL AS TO EXPAND THEIR MARKETING EFFORTS BEYOND THE STATE'S BORDERS TO SUCH AREAS AS MICHIGAN,

WESTERN TENNESSEE, EASTERN ARKANSAS, WESTERN MISSISSIPPI, AND CENTRAL LOUISIANA. IT'S NOT JUST LOCAL COMPANIES THAT WILL BENEFIT. NATIONAL COMPANIES WITH ESTABLISHMENTS IN SOUTHWEST INDIANA HAVE STRESSED THE IMPORTANCE OF QUALITY INTERSTATE TRANSPORTATION.

IN ADDITION, THE HIGHWAY WOULD PROVIDE IMPROVED ACCESS TO EDUCATIONAL INSTITUTIONS, RECREATIONAL FACILITIES AND CULTURAL ATTRACTIONS THROUGHOUT THE STATE AND THE REGION. MOREOVER, THE HIGHWAY WILL ENSURE THAT THE AREA WILL BE BETTER SERVED DURING MEDICAL EMERGENCIES AND NATURAL DISASTERS.

EVANSVILLE LIES IN A HIGH-RISK EARTHQUAKE AREA. THE NEW MADRID SEISMIC ZONE IS THE MAJOR EARTHQUAKE ZONE IN THE EASTERN HALF OF THE COUNTRY. IT INCLUDES SEVEN STATES -- INDIANA, KENTUCKY, ILLINOIS, MISSOURI, MISSISSIPPI, TENNESSEE AND ARKANSAS. THE LARGEST QUAKE IN THE CONTINENTAL UNITED STATES OCCURRED ALONG THE FAULT IN 1812. WHEN THE NEXT MAJOR QUAKE ON THE NEW MADRID FAULT OCCURS, WHICH GEOLOGISTS SAY IS LIKELY BEFORE THE TURN OF THE CENTURY, A MAJOR HIGHWAY ACROSS SOUTHWESTERN INDIANA WILL BE VITAL TO THE AREA'S IMMEDIATE AND LONG-RANGE RECOVERY.

THE BENEFITS OF BUILDING A HIGHWAY LINKING INDIANAPOLIS AND EVANSVILLE GO WELL BEYOND THE ADVANTAGES IT WOULD BRING TO THE STATE OF INDIANA. FOR EXAMPLE, WESTERN KENTUCKY WOULD RECEIVE WIDESPREAD BENEFITS FROM A HIGHWAY LINKING EVANSVILLE AND INDIANAPOLIS. HENDERSON COUNTY IS JUST OVER THE BORDER FROM EVANSVILLE. THIS AREA IS A HUB OF SUB-ASSEMBLERS FOR THE AUTO

INDUSTRY, ESPECIALLY PLASTICS. IN FACT, THE AREA HAS COME TO BE KNOWN AS "PLASTICS VALLEY." CURRENTLY, TRUCKS LEAVING HENDERSON COUNTY TRAVEL TO NORTHERN INDIANA AND MICHIGAN ON U.S. 41, WHICH IS CONSIDERED TO BE UNSAFE BY MANY TRUCKING FIRMS. THE ALTERNATE ROUTE, I-64 TO LOUISVILLE AND THEN I-65 TO INDIANAPOLIS, IS ROUNDABOUT. IN ADDITION, THE AUTO INDUSTRY PLACES GREAT EMPHASIS ON PUNCTUAL DELIVERY OF PARTS BY SUB-ASSEMBLERS. THE CURRENTLY AVAILABLE ROUTES FROM HENDERSON COUNTY TO MICHIGAN ARE NEITHER EXPEDIENT NOR RELIABLE. IMPROVED TRANSPORTATION WOULD GREATLY BENEFIT THESE HENDERSON COUNTY SUB-ASSEMBLERS. THIS IS JUST ONE EXAMPLE OF OUT-OF-STATE BENEFITS WHICH AN INDIANAPOLIS-TO-EVANSVILLE HIGHWAY WOULD BRING.

LOCAL AND STATE INTEREST IN THIS HIGHWAY PROJECT IS GREAT. INDIANA GOVERNOR EVAN BAYH IS A STRONG SUPPORTER OF THE INDIANAPOLIS-TO-EVANSVILLE HIGHWAY. IN FACT, GOVERNOR BAYH WANTED TO BE HERE TODAY. HOWEVER, TODAY IS THE FINAL SESSION DAY FOR THE INDIANA GENERAL ASSEMBLY. SO GOVERNOR BAYH HAD TO REMAIN IN INDIANAPOLIS. HE DID ASK ME TO SUBMIT HIS WRITTEN TESTIMONY FOR THE RECORD, AND I ASK UNANIMOUS CONSENT THAT I BE PERMITTED TO DO SO.

IN HIS STATEMENT, GOVERNOR BAYH SAYS THAT THE PROPOSED HIGHWAY LINKING EVANSVILLE AND INDIANAPOLIS "IS A PERFECT EXAMPLE OF HOW A STRONG FEDERAL/STATE PARTNERSHIP IN HIGHWAY DEVELOPMENT CAN PROVIDE A MUCH-NEEDED AND WELL-DESERVED TRANSPORTATION ARTERY FOR THE CITIZENS OF, NOT ONLY INDIANA BUT, THE ENTIRE REGION AND NATION." THE GOVERNOR ALSO POINTS OUT THAT THE INDIANAPOLIS-TO-

EVANSVILLE HIGHWAY WILL PROVIDE MUCH-NEEDED RURAL ACCESS AND WILL ENCOURAGE ECONOMIC DEVELOPMENT. THE GOVERNOR SAYS THAT HE HOPES THAT THE INDIANAPOLIS-TO-EVANSVILLE HIGHWAY COULD SERVE ULTIMATELY AS A MAJOR LINK TO EFFECTIVELY EXTEND I-69 FROM NORTHERN MICHIGAN THROUGH THE HEARTLAND TO MEMPHIS.

GOVERNOR BAYH HAS PROPOSED TO USE IN EXCESS OF A QUARTER OF A BILLION DOLLARS IN HOOSIER LOTTERY PROFITS AND OTHER STATE FUNDS TO CONSTRUCT A SIGNIFICANT NEW FOUR-LANE SEGMENT OF THE ROUTE, BETWEEN BLOOMINGTON AND PETERSBURG. THE GOVERNOR HAS DIRECTED THE INDIANA DEPARTMENT OF TRANSPORTATION TO IMMEDIATELY UNDERTAKE LOCATION AND PRELIMINARY ENVIRONMENTAL STUDIES, AT AN ESTIMATED COST OF MORE THAN $3 MILLION, ON THE SEGMENTS BETWEEN EVANSVILLE AND BLOOMINGTON.

GOVERNOR BAYH MET RECENTLY WITH SECRETARY OF TRANSPORTATION SAMUEL SKINNER TO DISCUSS THE HIGHWAY PROPOSAL. SECRETARY SKINNER TOLD THE GOVERNOR THAT AN INDIANAPOLIS-TO-EVANSVILLE HIGHWAY HAS "A LEGITIMATE CHANCE OF GETTING SIGNIFICANT FEDERAL FUNDING" IF THE STATE STANDS READY TO CONTRIBUTE FUNDS TOWARD THE BUILDING OF THE HIGHWAY. GOVERNOR BAYH HAS INDICATED THAT HE IS COMMITTED TO WORKING IN PARTNERSHIP WITH THE FEDERAL GOVERNMENT IN BUILDING THE SOUTHWESTERN INDIANA HIGHWAY.

IN ADDITION TO THE GOVERNOR'S SUPPORT, THE HIGHWAY HAS RECEIVED BIPARTISAN SUPPORT FROM MEMBERS OF THE STATE LEGISLATURE AND LOCAL ELECTED OFFICIALS. I ASK UNANIMOUS CONSENT THAT I BE PERMITTED TO SUBMIT FOR THE RECORD A LETTER OF SUPPORT FROM FRANK MCDONALD II, THE MAYOR OF THE CITY OF EVANSVILLE.

IN ADDITION TO GOVERNMENTAL SUPPORT FOR THE HIGHWAY, THE RESIDENTS OF SOUTHWESTERN INDIANA STRONGLY SUPPORT THE CONSTRUCTION OF THE HIGHWAY. MORE THAN 3,500 PEOPLE ATTENDED A SERIES OF PUBLIC MEETINGS IN OCTOBER, 1988 AND IN JANUARY AND JULY, 1989. THE PARTICIPANTS AT THOSE MEETINGS INCLUDED LOCAL RESIDENTS, ELECTED OFFICIALS, AND BUSINESS LEADERS. VIRTUALLY ALL OF THOSE TESTIFYING AT THE PUBLIC HEARINGS EXPRESSED STRONG SUPPORT FOR THE HIGHWAY PROJECT. EASTERN ILLINOIS AND NORTHWESTERN KENTUCKY BUSINESS LEADERS AND ELECTED OFFICIALS PARTICIPATED IN THOSE MEETINGS AND SUBMITTED TESTIMONY ON THE POSITIVE ECONOMIC IMPACT THE INDIANAPOLIS-TO-EVANSVILLE HIGHWAY WILL HAVE ON THEIR REGIONS. BESIDES AAA CLUBS, CHAMBERS OF COMMERCE AND LOCAL DEVELOPMENT AGENCIES ALL STRONGLY SUPPORT THE HIGHWAY PROJECT.

IN CONCLUSION, I URGE THE SUBCOMMITTEE TO INCLUDE THE INDIANAPOLIS-TO-EVANSVILLE HIGHWAY IN ITS PLANS TO IMPROVE NORTH-SOUTH INTERSTATE TRANSPORTATION THROUGH THE MIDWEST AND THE CENTRAL SOUTH. THANK YOU ONCE AGAIN FOR THE OPPORTUNITY TO APPEAR BEFORE YOU.

HONORABLE LEE H. HAMILTON

TESTIMONY BEFORE THE

HOUSE PUBLIC WORKS COMMITTEE

SUBCOMMITTEE ON SURFACE TRANSPORTATION

March 13, 1990

Mr. Chairman and Members of the Committee. Thank you for giving me an opportunity to express my strong support for developing a new interstate highway in Indiana linking Indianapolis and Evansville. As you develop the 1991 Surface Transportation Authorization Act, I hope you will authorize federal funding for this Evansville-Indianapolis interstate.

At the present time, there is no direct route linking Indianapolis, the state capital, with Evansville, one of the major cities in Indiana. Governor Bayh has proposed to develop a new Indianapolis-Evansville interstate highway, assuming that the state can receive some federal assistance in financing the project.

The new interstate would be build in four stages:

Indianapolis-Bloomington: Presently, a 4-lane state highway links the two cities. This state road would be upgraded to an interstate highway. Extensive bridge and interchange work would be required. A preliminary cost estimate is $152 million.

Bloomington-Newberry: This section would be built from State Road 37 at Bloomington to State Road 57 near Newberry, Indiana. This area south of Bloomington requires immediate highway improvements because of

THIS STATIONERY PRINTED ON PAPER MADE OF RECYCLED FIBERS

heavy congestion. The new interstate will replace state roads which are inadequate to handle the 13,000+ vehicles that use the roads each day. This interstate segment is projected to cost some $120 million.

Newberry-Petersburg: State Road 57 currently links these two communities. State officials are evaluating whether it would cheaper to upgrade State Road 57 to an interstate or whether a separate highway would be required. At a minimum, this section of the interstate is expected to cost at least $115 million.

Petersburg-Evansville: These two cities are also linked by State Road 57, and similar studies will determine the most efficient means to develop an interstate highway between these two communities. This final portion of the new interstate would run from Petersburg to the intersection of I-64 and I-164 just north of Evansville. Cost estimates for this portion of the interstate have not yet been determined.

The state of Indiana is making a strong commitment to improve interstate highway for Indiana and for the central United States. Governor Bayh has recently initiated location and preliminary environmental studies for the proposed Evansville-Indianapolis interstate. These studies are expected to cost $3 million and should be completed by November, 1991. Construction of the new interstate is expected to begin in 1996. The state of Indiana's commitment to this needed interstate project, along with appropriate federal assistance, will ensure the success of the project.

A new interstate accomplishes several important objectives for Indiana, for the midwest and for the nation.

First, an interstate highway would provide a much needed north-

south corridor in the central U.S. Few interstates in the Midwest now run north to south. The proposed Evansville-Indianapolis interstate would complete an interstate corridor running from Detroit to Memphis, and beyond. Assuring safe and effective interstate travel will be great boost for economic development in this part of the country.

Second, this new interstate is needed in Indiana to accommodate the rapid growth that has been projected for southern Indiana over the next several decades. Recent studies project employment increases of over 40% between 1985 and 2020 in southwest Indiana. The most rapidly growing parts of the region will be the area of Martin, Dubois and Spencer counties, where employment increases should exceed 43%, and in the Bloomington/Bedford area, which has a forecast employment growth rate of 40%. Both of these projected high growth areas are located near the proposed Evansville-Indianapolis interstate.

The Indianapolis-Evansville interstate enjoys the strong support of Indiana's state and local officials. All of us realize how vital this highway would be for the residents of Indiana and for the region. I strongly urge the committee to authorize federal funding to help Indiana in completing this needed interstate highway.

Thank you very much for consideration of this project.

Mr. MINETA. At this time, let me introduce our very fine colleague from Texas, Congressman Jim Chapman, a very powerful member of a very powerful Appropriations Committee, a former colleague and member of the House Public Works and Transportation Committee.

Mr. CHAPMAN. And today, Mr. Chairman, your humble servant.

Mr. MINETA. I'll use that same line when I am testifying before your subcommittee, Mr. Chapman.

TESTIMONY OF HON. JIM CHAPMAN, A REPRESENTATIVE FROM TEXAS

Mr. CHAPMAN. Thank you, Mr. Chairman.

I appreciate this opportunity to speak on behalf of a project that is not just a Texas project, but a project for all of America. I would like to thank you and the members of your subcommittee for this opportunity.

Having served as a member of the Surface Transportation Subcommittee and the powerful Public Works Committee, I can appreciate both the challenge and the job that you have.

Mr. Chairman, today I would like to testify in support of what, in the heartland of America, has come to be known as the "Mid-America Connection." There is a handout, that should be at each of the desks before the subcommittee, of a small map of the interstate system in this country that will show that between the Mississippi River and the Rocky Mountains there is no complete north-south artery that traverses the United States of America.

While there are Interstates 29 and 35 from basically Canada to Kansas City, and Interstate 49 under construction from Shreveport to New Orleans, and a major four-lane highway from Texarkana to Houston, there is no link between those two cities. The closest north-south artery of the country is at the Mississippi River all the way over to the Rocky Mountains.

There is a 500-mile gap in the interstate system that, according to a feasibility study authorized by this committee and the Congress in 1986, would serve 40 million Americans, directly serve 11 States—a link in the interstate system that I do not understand why it was omitted in the original plan, but one which would connect Shreveport, Louisiana, with Kansas City, Missouri. Only 17 miles of that link would be in the State of Texas, yet I cannot think of any highway artery more important to my State, to Louisiana, and to all the States between Shreveport and Kansas City.

The feasibility study conducted by the Department of Transportation in 1987, completed in 1988, establishes that fully 20 to 25 percent of Americans would directly benefit from this highway. It is a highway that would replace a current highway system which is labeled the most dangerous in the heartland in America at which the fatality rate exceeds twice the national average, one which would serve the poorest of Americans in some of the most economically depressed parts of our country.

That feasibility showed that, in addition to the geography that this highway link would serve, that there are military installations which are identified on the maps that are before you, major centers of commerce. Over 130,000 American troops and their bases are lo-

cated along the route of the interstate highway. And major recreational areas which are today virtually inaccessible would also be served by this highway connector.

What I would like to do is relate today to you how this project relates to the President's new transportation policy. Last week the President stated that there were going to be basically five criteria the Administration felt would warrant expansions of our highway system: to maintain and expand the national transportation system, to foster sound financial bases, to keep our transportation industry strong and competitive, to support public safety and national security, and to protect the environment and the quality of life. This connector fully qualifies on all of those criteria.

The American Association of State Highways and Transportation Officials recently released their recommendations—and I understand they are to testify here today—for national transportation policy. AASHTO calls for increased funds for highways of national significance, and certainly, Congressman Shuster, within the parameters that you have described this would have to be a prime candidate for such a highway.

This highway would provide for national defense needs, as I outlined, enhance economic vitality because it would serve some of the poorest parts of our country. And I might add almost half of this highway would traverse Congressman Hammerschmidt's district. In fact, Congressman Hammerschmidt has been very effective in the form of demonstration projects in building portions of this link south from Kansas City in previous highway authorization legislation.

This highway needs to be completed. It is a vital link that would connect Canada to the ports on the Gulf of Mexico, it would serve some 40 million Americans, and would be of tremendous economic benefit to 11 States in our nation's heartland.

Mr. Chairman, I would just simply ask that this particular link be considered as one of the prime candidates in this committee's discussions of its new Highway Act reauthorization, and that this committee smile favorably upon this as a part of that connection. I think it is truly a missing link in our highway system.

I would be happy to answer any questions you may have.

Mr. MINETA. Thank you very much, Mr. Chapman.

In your statement you indicate a need for Federal support to advance construction of this roadway known as the MAC—the Mid-America Connection. Through the reauthorization of the surface transportation programs how can the Federal Government assist the States in the coordination of this project?

Mr. CHAPMAN. Mr. Chairman, what we simply need is either a designation that this project qualifies under the new law for what the equivalent would be under current law of the interstate system.

This highway is supported by the administrations and governors of all the States. In fact, it is a big issue in the Arkansas governor's election this year. All of those candidates have expressed support for this highway link as one of their top priorities.

The State of Texas is ready to move forward. The State of Louisiana is ready to move forward. We simply need the authorization from the Congress that under whatever the successor program will

be that would enhance and expand, in effect, our interstate system, that this highway would be one of those links.

If the funding, as Congressman Shuster suggests, may not be under the new system a 90/10 match, whatever the primary highway may be, this project needs to be authorized under that. And if the Congress should do that, the States are ready to move forward with their current allocation from the Federal Highway Trust Fund. They are ready to begin construction.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. I have no questions. I just very much appreciate your testimony. I think it is the kind of thing we need to focus on. Thank you.

Mr. CHAPMAN. Thank you.

Mr. MINETA. Mr. Bosco.

Mr. BOSCO. No questions.

Mr. MINETA. Mr. Boehlert.

Mr. BOEHLERT. No questions.

Mr. MINETA. Mr. Laughlin.

Mr. LAUGHLIN. Mr. Chapman, I commend you for your testimony. I am a little surprised that you only put 17 miles of this in our State out of the 500-mile system.

Mr. CHAPMAN. I had to bend it a little west, Greg, to get 17 miles of it into the State. No, it is appropriate, really.

Mr. LAUGHLIN. I understand. Why is there such a safety problem along this current road system that causes it to have a death rate double the rest of the highways in our nation? And why would this Mid-American Connection, in your opinion, reduce that death rate?

Mr. CHAPMAN. Congressman, quite frankly, one of the worst major arteries in the heartland of America is Highway 71. It goes north from Texarkana to Fort Smith and then connects on to Kansas City. The death rate on that stretch of highway—it is two-lane, it has unimproved shoulders, it is heavily, heavily traveled, and, as a result of its condition, it has doubled the national highway fatality rate.

To improve that roadway from the safety aspects, alone, I think would be justification. But that stretch of highway is one of the most dangerous in the country from the standpoint of volume of traffic and the demonstrated number of traffic fatalities and accidents that we have had. The safety aspect of it is one of the things that I think is a tremendous justification for the project.

Mr. LAUGHLIN. Thank you very much.

That's all the questions I have, Mr. Chairman.

Mr. MINETA. Mr. McEwen.

Mr. MCEWEN. No questions.

Mr. MINETA. Mr. Clement.

Mr. CLEMENT. Yes. Congressman Chapman, how are you going to divide the cost between the respective States?

Mr. CHAPMAN. Congressman, it would be done basically by the mileage. The States would have to build their portion of this highway from their allocation from the Highway Trust Fund. That would be a decision that would be made by the appropriate State Highway Commissions, and they would basically decide what portions and from what directions to build the highway. But it would be apportioned primarily by the mileages that are involved, and

those States would have to build from their allocation that portion of the highway that lay within that State.

Mr. CLEMENT. Have all the States endorsed this particular highway?

Mr. CHAPMAN. Absolutely. In fact, this highway would be constructed as a part of the current interstate system had it been authorized as a part of the current interstate system. It is much needed, and State highway authorities are ready to move forward.

Mr. CLEMENT. And what is the projected cost?

Mr. CHAPMAN. The feasibility study identified total cost as about $1.7 billion. Of course, over 517 miles, that would take a number of years to construct. But from the question that was asked of the previous Members, that would come, as I understand it, from the State's allocation under the current system.

Mr. CLEMENT. And what are you looking for in terms of commitment from the Federal Government?

Mr. CHAPMAN. We would just want to know that the Mid-America Connection would enjoy one of the top priorities for expansion and connection to the interstate system. If we are not going to have new interstate highways under the new highway program, then whatever would be compatible with that interstate, whatever it is called, whatever the top Federal commitment is going to be to the expansion of the interstate system, we would hope that this highway would fall within the framework of receiving that kind of commitment and priority from the Federal Government.

Mr. CLEMENT. Thank you.

Mr. MINETA. Mr. Duncan.

Mr. DUNCAN. Just one question, Congressman Chapman. Why was this not authorized before? Do you know? Is it because this is a largely rural area?

Mr. CHAPMAN. Congressman Duncan, I don't know if it is just in the last 30 years that the growth has been such that this north-south artery now is dramatically needed and desperately needed. I don't know the answer to that because when you look at a map of our interstate system, it just jumps at you that this, from Kansas City to Shreveport, should be an interstate highway. It is not there. In fact, from the Mississippi River to the Rocky Mountains—I-35 goes to Oklahoma City and stops—there is no link. That is why such a large portion of the country would be served by this particular connector. I have no idea of the history of why it was not included in the original interstate system.

Mr. DUNCAN. Is the current road more heavily travelled than some of the other interstates close by?

Mr. CHAPMAN. Absolutely. In fact, the feasibility study, Congressman, said that this would be one of the most heavily travelled interstates in the country when built.

Mr. DUNCAN. And you say it would cost $1.7 billion for the total 500 miles?

Mr. CHAPMAN. That's correct. That was the estimate.

Mr. DUNCAN. All right. Thank you very much.

Mr. MINETA. Mr. Sangmeister.

Mr. SANGMEISTER. No questions.

Mr. MINETA. Mr. Payne.

Mr. PAYNE. No questions.

Mr. MINETA. Well, thank you very much, Mr. Chapman, for your very fine presentation. This subcommittee will keep it under consideration as we move forward during the reauthorization process.

Mr. CHAPMAN. Mr. Chairman, thank you very much for this opportunity. I appreciate it.

[Mr. Chapman's prepared statement follows:]

BACKGROUND OF TESTIMONY

THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

Submitted by:

The Honorable Jim Chapman

FACTS ON KANSAS CITY TO SHREVEPORT FREEWAY

I. SCOPE: Connect Kansas City with Shreveport with a four lane, divided, controlled access highway.

II. NEED: The 1987 feasibility study was approved by the D.O.T. in March 1988. Justification for construction has been acknowledged.

III. KEY POINTS:

SAFETY: U.S. Highway 71 in Arkansas has six traffice accidents per mile and one death every 4.7 miles each year. Far above the national average. There are 267 miles of U.S. Highway 71 in Arkansas.

ECONOMICS: The Kansas City - Shreveport highway will fill a gap over 500 miles wide between existing North-South interstate highways. It will intersect East-West interstates I-10; I-20; I-30 and I-40. It will connect with I-49 at Shreveport and both I-29 and I-35 at Kansas City. It will complete an existing highway system which will provide safe and cost effective transportation from Canada to the Gulf of Mexico.

Interstate and international trade will result by reducing distance and travel time to the ports of Houston and New Orleans. These are the nearest ports to every state along the route.

Eleven states in the Nation's heartland will benefit. Manufacturing, distribution, agriculture and tourism will be enhanced.

This will be the nearest North-South Freeway to 20% of the Nation's population.

DEFENSE: The states served by this addition have several major military installations. There are four air bases, three ammunition plants, one maintenance and supply depot and seven troup training facilities. There are currently over 130,000 U.S. Army troops stationed in the states served between Kansas City and the Gulf of Mexico.

This highway will enhance the economic opportunities for an area of the country with the lowest per capita income and highest un-employment rates.

The MAC-PAC is a group of community leaders from five Southern and Midwestern states. This group represents a broad based, grass roots drive to construct a multi-lane, limited access roadway linking Kansas City, Missouri with Shreveport, Louisiana. The roadway has come to be known as the Mid-American Connection or "MAC". Area residents along the proposed North-South corridor gave birth to this idea in 1972 and it has been gaining momentum ever since. The MAC-PAC has achieved amazing success in securing firm and coordinated support for this endeavor not only among the five states that would directly benefit from the roadway, but also from the entire surrounding area. This group has established a communication network which includes every Chamber of Commerce in the corridor from Canada to the Gulf of Mexico. Presently, the MAC-PAC is working with the state legislatures of the applicable states in order to secure funding commitments. However, to make this dream a reality, they will also need Federal Support.

The construction of the MAC will directly result in substantial economic, defense and safety benefits for twenty percent of the U.S. population and indirectly benefit all of America. I feel that there is no other proposed highway in America that would have a more profound impact on the economies of as many states as the MAC. Nor is any other route as sorely needed.

RECREATIONAL AREAS

Mr. MINETA. Let me at this time call on our very fine colleague from Arkansas, Congressman Bill Alexander, another powerful member of the powerful Appropriations Committee.

Mr. Alexander, go ahead and proceed in your own fashion. Have you submitted a statement to us?

Mr. ALEXANDER. Mr. Chairman, I have submitted a statement.

Mr. MINETA. It will be put into the record following your oral presentation.

Please proceed in your own fashion.

TESTIMONY OF HON. BILL ALEXANDER, A REPRESENTATIVE FROM ARKANSAS

Mr. ALEXANDER. Mr. Chairman, thank you for conducting these hearings. I think all of us were pleased last week to receive the Secretary of Transportation's plan for a national transportation policy. It was appreciated by all of us as we begin an important debate on America's infrastructure needs for the 21st Century.

I would hope that as the United States builds down its military/industrial complex in the post-Cold War era we would build up our public works investment in the nation's infrastructure, which is crumbling and falling down in part because of neglect over the past 20 years.

The problem that I have with the Administration's plan is, of course, that there are no specific suggestions on how to pay for highway improvements and other infrastructure investments. Instead that plan generally follows the President's budget proposal, which requests a 21 percent decrease overall in Federal aid to highways during the next five fiscal years.

For wealthy States or rich States that might be appropriate. I can't say, because I represent a poor State, Arkansas. We cannot afford to be a part of a national transportation system without Federal aid. We receive less than we contribute in Federal highway assistance now. Under the present low we pay more in taxes than we receive back in aid. Simply stated, our highways and roads and bridges are falling down. They are coming apart and falling down.

I am not here today to add to the rhetoric about the President's plan so much as I am to talk about specific needs that are immediate for us.

For example, there is a bridge over U.S. Highway 70 that spans the White River at De Valls Bluff, Arkansas. I request an authorization of $7.1 million to construct a replacement for this deteriorating structure that has been in place since the 1920s. A couple of years ago it was struck by a barge heading downstream on the river. The barge dislodged the span of the bridge that was raised in order to permit passage of the barge traffic. The bridge has not been replaced; it has only been repaired.

The head of the Highway Department in Arkansas has stated in a letter to me, and in 1988 testimony before this Subcommittee, that he is not satisfied with the safety of the bridge. He also says it is imperative that Highway 70 remain functional at all times in the region and that it serves, of course as an important link in the commerce of that region. He is very much concerned about its need to be replaced.

There are many other things that I can talk about that are of importance in my district, but I would just touch upon a couple of things that need assistance from a national transportation policy.

We have a growth center in Jonesboro, Arkansas, the largest city in my district, that is congested because of a lack of a transportation plan in that region. It is gridlocked because of that growth.

Northeast Arkansas and West Tennessee are linked economically, culturally, and demographically, and there is a natural common market between our two States and with Southwest Kentucky and Southeast Missouri. Those regions need to be linked with an interstate-like highway that has been talked about for years that would start at Jacksonville, Florida, and pass through Georgia, Alabama, and Tennessee, crossing the Mississippi River at a place near Osceola, Arkansas, and proceeding across the northern part of Arkansas to Kansas City—another important need that has gone unmet because of the lack of a transportation policy.

Mr. Chairman, I look forward to the work of this committee and to participating actively as you develop a national transportation policy because during the next decade it appears to me that you are going to be very busy providing for the decaying infrastructure and the new roads and bridges that are needed in America in order to plan and provide for the 21st Century.

I thank you very much for the opportunity to be here, and I will be pleased to answer any questions which you have.

Mr. MINETA. Very well. Thank you very much, Congressman Alexander.

You indicated that you concur with the people of De Valls Bluff area with their assessment that a replacement bridge is needed for the U.S. 70 bridge. Could you explain to the committee how the replacement of that bridge would enhance the economic benefits to the people of the De Valls Bluff area?

Mr. ALEXANDER. Well, De Valls Bluff—it is a choke point on the White River where people travel back and forth to engage in all forms of commerce, both locally and regionally. It is a main crossing in Arkansas between and among the various counties in the region for transporting the products that are produced there and the people who that work in and around that area.

In addition, it is one of only two major links between Little Rock and Memphis.

The bridge is falling down. It is almost 60 or 70 years old. It really needs to be replaced before someone is injured by it. We can't do without it. I guess we'd have to go back to crossing across by barges if we didn't have what we have there now.

Mr. MINETA. Thank you very much.

Mr. Duncan.

Mr. DUNCAN. No questions.

Mr. MINETA. Mr. Bosco.

Mr. BOSCO. No questions.

Mr. MINETA. Mr. Clement.

Mr. CLEMENT. No questions.

Mr. MINETA. Mr. Sangmeister.

Mr. SANGMEISTER. No questions.

Mr. MINETA. Mr. Payne.

Mr. PAYNE. No questions.

Mr. MINETA. Well, Mr. Alexander, thank you very, very much for your presentation.

Mr. ALEXANDER. Thank you very much.

[Mr. Alexander's prepared statement follows:]

TESTIMONY OF
HON. BILL ALEXANDER
ON
HIGHWAY REAUTHORIZATION, FISCAL YEARS 1992 AND BEYOND
BEFORE THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS
U. S. HOUSE OF REPRESENTATIVES
TUESDAY, MARCH 13, 1990
2167 RAYBURN HOUSE OFFICE BUILDING
10:00 A. M.

Thank you, Mr. Chairman and members of the Subcommittee. It's a pleasure for me to appear before you today to discuss some of the unmet highway needs of the First Congressional District of Arkansas, and how they relate to national problems that must be addressed in the next highway authorization bill.

Last Thursday, the Administration released its national transportation strategy. I commend the President, Secretary Skinner, and others who worked on it for beginning a critical national debate about America's infrastructure needs for the 21st Century.

The problem that I have with the Administration's plan is that it offers no specifics on how to pay for highway improvements, except for suggestions that user fees go up and that the bill be presented to state and local governments. It follows the path set forth in President Bush's budget, which proposes to cut real budget authority for federal-aid highways by 21 percent over the next five years.

For rich states, this might be prudent and appropriate in a time of tight Federal budgets. But poor states like Arkansas simply must have more Federal help to keep their roads from crumbling and their bridges from falling.

In rural America, our roads and bridges need maintenance and expansion; our tax base doesn't begin to cover our infrastructure needs; and yet, our people, who drive more and have less access to mass transit, pay more into the Highway Trust Fund than they get out of it.

Under the Administration's transportation plan, rural America remains between a rock and a hard place. Local governments will continue to have an inadequate tax base because they have inadequate highways; and they will continue to have inadequate highways because they have inadequate tax bases.

The Administration has made a good start. But someone must flesh out their outline, and keep in mind rural America's needs. Two hundred years ago, the Constitution gave the job to Congress.

As we enter the post-Cold War era, it is time we reexamined budget priorities and devoted more resources to investment in highway transportation. Beyond that, it is time we came up with a comprehensive, detailed, national public works strategy.

I've come here today not just to engage in rhetoric about the Administration's plan, but to talk about a specific project in my district -- a new bridge on U. S. 70 over the White River at DeValls Bluff, Arkansas.

I formally request that the Subcommittee recommend authorization of $7.1 million in contract authority for replacement of the existing bridge as a demonstration project in the 1991 highway authorization bill, or sooner if an appropriate legislative vehicle presents itself.

I am confident that, as I explain the project in detail, you will see that it is typical of unmet needs that exist in every Congressional District and probably every county across the nation.

Two years ago this month, Mr. Chairman, I appeared before this Subcommittee to ask for your help in constructing a new U. S. 70 bridge at DeValls Bluff. I'm still asking for your help.

When we last discussed DeValls Bluff, the existing bridge was out of commission. A barge had struck a pier, locking the bridge's lift span in the "up" position. The bridge was repaired in September, 1988, after eight months of disruption, at a cost of approximately $1 million to the State of Arkansas.

However, we knew then that repairing the bridge was a Band-Aid, not a cure. The bridge was built in 1922. Its bridge rating in 1988 was 62.6, or "functionally obsolete." It has been closed for extended periods twice since 1972.

In April, 1988, Mr. Maurice Smith, director of highways and transportation for the State of Arkansas, wrote me to re-state his request for Federal funding for the bridge replacement project. I ask permission to include the full text of his letter in the record. But, if I might, I would like to quote from key passages of the letter:

> "We project that the bridge will be open again in September, but there will be an uneasy feeling by the traveling public as they cross it. ~~I am~~ not at all satisfied with its safety . . .

"It is imperative that Highway 70 remain functional at all times in the event the bridge across the White River on I-40 has to be closed for some reason . . .

"We realize our normal Federal Aid Bridge Replacement Funds can be utilized to replace this bridge. However, the estimated $7.1 million required to replace the bridge and approaches would severely limit our present bridge replacement program, especially since the 1987 Federal Aid Highway Act has reduced our bridge replacement funds about $9.5 million per year. This, coupled with other federal restraints, has placed a burden on our ability to replace other important bridges throughout the state."

The DeValls Bluff bridge is enough of an economic burden to the people of Prairie County, Arkansas, and enough of a threat to the lives and property of the people who use it, that I am asking you for special help.

I would like to say that this situation is extraordinary. Unfortunately, I cannot truthfully do so. The DeValls Bluff bridge is only one of the nearly quarter-million highway bridges, 77,000 on the Federal-aid system alone, that is either "structurally deficient" or "functionally obsolete." The 77,000 figure represents 28 percent of all Federal-aid bridges, an increase of roughly 10,000 since 1982 alone.

There are some other highway needs in Arkansas' First District that I would like to mention. No plans have been developed, and no price tags calculated, to address these items. Therefore, I am not asking for specific assistance for them today, although I may do so at some point in the future.

These Arkansas needs are further examples of unmet national highway needs. As such, they illuminate the task before your subcommittee:

*The city of Jonesboro, Arkansas, is the largest city in the First Congressional District and the economic hub of a multi-county region. Roads and highways adjacent to the city's major commercial areas now carry more traffic than they were designed to handle. In the next highway bill, some of the money for gridlock relief must go to smaller cities.

*Northeast Arkansas and West Tennessee are economically, culturally, and demographically similar. They could form a natural "common market." But the Mississippi River separates the two regions as effectively as it did in frontier times. Local leaders on both sides of the river have been working to develop support for construction of a new Mississippi River bridge near Osceola, Arkansas. Similar needs must exist along the river from Minnesota to the Gulf. But these needs will go unmet until Congress, in partnership with the affected states, finds millions to build bridges.

*We all celebrate the near-completion of the Interstate Highway System after four decades of effort. However, there are some gaping holes in the system. One of the biggest is the area across the South from Jacksonville, Florida, through Arkansas to Kansas City, Missouri. This corridor runs through some of the counties in the rural South that still lack access to major four-lane highway arteries, and most need the economic boost that comes from having an Interstate highway.

In conclusion, Mr. Chairman, I urge the subcommittee to meet these national needs with a bold and aggressive highway improvement strategy. To do less is to seriously weaken our efforts at economic development.

Some say we have more will than wallet. I say, where there is will, there is a way.

Thank you very much.

CHARLES VENABLE
CHIEF ENGINEER

April 29, 1988

Honorable Bill Alexander
United States Representative
233 Cannon House Office Building
Washington, D. C. 20515

Dear Bill:

As you are aware, we awarded a contract on April 7, 1988, for repair to the Highway 70 bridge across the White River at DeValls Bluff at a cost of approximately $1.0 million.

Although the bridge will be repaired and opened to traffic, we are still concerned about the structural integrity of the bridge. The bridge was originally constructed in 1925 and has been closed twice since 1972.

Since the pier that was hit by the barge was knocked out of alignment, there is no guarantee that further shift to the pier will not occur. There appears, at this time, to be no structural damage to the pier; however, I am deeply concerned that because of the sudden rise and fall of the flow in the river, there might be serious consequences in the future. We project that the bridge will be open again in September, but there will be an uneasy feeling by the traveling public as they cross it. I am not at all satisfied with its safety.

It is imperative that Highway 70 remain functional at all times in the event the bridge across the White River on I-40 has to be closed for some reason. The closing of the bridge also creates severe economic problems for the area since it serves as the lifeline for the communities located on each side of the river.

We realize our normal Federal Aid Bridge Replacement funds can be utilized to replace this bridge. However, the estimated $7.1 million required to replace the bridge and approaches would severely limit our present bridge replacement program, especially since the 1987 Federal Aid Highway Act has reduced our bridge replacement funds about $9.5 million per year. This, coupled with other federal restraints, has

ARKANSAS STATE HIGHWAY COMMISSION
LITTLE ROCK, ARKANSAS

Honorable Bill Alexander
Washington, D. C.

placed a burden on our ability to replace other important bridges throughout the state.

It is doubtful that the bridge will ever be structurally sound again. Anything you can do to acquire funds to replace the bridge over and above our normal allotment and obligation limit, will be greatly appreciated.

Sincerely,

Maurice Smith

Maurice Smith
Director of Highways
and Transportation

Mr. MINETA. Continuing our flow of members of the Appropriations Committee, let me welcome to our committee a former member, Congressman Frank Wolf of Northern Virginia.

Frank, your statement will be made a part of the record. Please proceed in your own fashion.

TESTIMONY OF HON. FRANK R. WOLF, A REPRESENTATIVE FROM VIRGINIA

Mr. WOLF. Thank you, Mr. Chairman. I appreciate this opportunity to testify.

Over the course of the hearings you will hear many statistics about our nation's transportation system, but they really don't tell the story, however, until they are put in real terms.

In the area I represent, Northern Virginia, the reality is a work day that begins for many before 5:00 a.m. and which doesn't end until nearly 7:00 p.m., all because of traffic congestion. Reality in my area is long hours spent in congestion on I-66, I-95, the Capital Beltway, and other highways—hours which could be spent with the family and productively at work.

The point is clear: transportation, and specifically traffic congestion, is a top issue in Northern Virginia and in many, many other urban and suburban areas around the United States.

The current Federal highway program does not adequately address the needs of urban and suburban areas of the country which are facing high levels of traffic congestion. Any new Federal highway program must address this issue. Legislation I have introduced, H.R. 961, the Gridlock Relief for Interstate Program, is cosponsored by a bipartisan group of 55 members of the House and 7 members of this subcommittee. The leading Democrat is Congressman Hoyer from Maryland. It would directly address this problem by allocating Federal funds to urban and suburban areas of the country to expand the capacity of congested highways.

Northern Virginia typifies the problems that are faced by many urban and suburban areas of the country and tens of millions of individuals each day.

In Northern Virginia, Interstates 66, 395, 495, and 95 are in near gridlock almost all mornings. The result is commuters cannot get to work.

Our legislation, the GRIP bill, would provide formula grants estimated at $53 million a year for Virginia, that would allow I-66 to be widened and bottlenecks on the Capital Beltway to be removed.

I use Virginia as an example, but the GRIP funds would be available to and could help all urban and suburban areas of the country. Los Angeles would benefit, San Francisco would benefit, as would New York, Chicago, Miami, Houston, Dayton, Cleveland, cities like Miami Beach, Jacksonville, Orlando and Tampa.

The formula we have developed would target funding at a rate of $2 billion a year to the most congested areas. Funds would be allocated according to a formula that considers the number of lane miles in an urban/suburban area as well as total vehicle miles travelled; that is, the more congested the area, the greater the opportunity to receive help.

Many cities, as well as a number of States, have endorsed our proposal. A copy is attached for the record. We have also been endorsed by the U.S. Conference of Mayors, the National Association of Regional Councils, the AAA, the American Road and Transportation Builders Association and many large cities—Newark, New Orleans, Spokane, Tampa, Miami, and many others.

I recognize that additional highway capacity is only part of the solution to urban/suburban traffic congestion. It is an important part, but we also must ensure that adequate mass transit facilities are available. For that reason, the GRIP bill, H.R. 961, specifies the funds could also be used to acquire rights of way for mass transit facilities and for land for park and ride programs.

The provisions of H.R. 961 are not sacrosanct. Some of the provisions of the formula—for example, or the scope of the highways covered—may need to be altered. I believe very strongly however, Mr. Chairman, that the new highway bill must include provisions which address the growing problems of urban and suburban traffic congestion.

H.R. 961 has focused attention on this problem and has generated discussion on the best way to attack it and it has received widespread support both in the Congress and around the country.

GRIP or similar provisions that would provide for expansion of existing highways are part of the solution to congestion problems. Another part of the solution is the construction of new highways.

In Northern Virginia, for example, we desperately need an outer bypass. A bypass highway which would cost an estimated $3 billion would divert as much as 33 to 50 percent of the north-southbound I-95 traffic that now travels through the Washington metropolitan area. Thousands of cars and trucks now travelling from Florida to New York or from North Carolina to Massachusetts would be diverted from the Capital Beltway, the Woodrow Wilson Bridge, I-95 and 395, and other highways, dramatically reducing traffic congestion in the area.

Many other areas of the country also have similar need for new highways. With limited local, State, and Federal funds available for the construction of highways, these roads will remain on the drawing boards and traffic congestions will continue to increase.

Because of the great need for new highways and the lack of any source sufficient to meet the price tag for these roads, I will be introducing legislation shortly that would allow Federal funds to be used with State and local and private funds to construct new toll highways. Current Federal law does not permit Federal funds to be used in the construction of new toll highways. This would be helpful to many highway programs.

The use of bond financing would allow all the necessary funds to be obtained at one time so that construction could begin early and be completed quickly. Most experts agree there is no faster way to begin a complete construction of important and badly-needed new highways than to use toll financing, and I believe it is appropriate that Federal funds be used in this process.

The use of Federal funds in the construction of toll highways is supported by the American Association of State Highway and Transportation Officials and other organizations, and has been suggested by the Administration.

My last suggestion, Mr. Chairman, concerns the Federal right-of-way revolving fund which makes interest-free loans repayable in two to ten years to States for the purchase of rights-of-way in advance of highway construction. The purpose of this program is to help States and localities avoid the impact of inflation of land prices in areas of rapid appreciation.

Last year we in Virginia and Fairfax County were able to obtain approval of such a loan which enabled us to purchase parcels of land for the Fairfax County Parkway. That loan will save Fairfax County and the State of Virginia tens of millions of dollars because the parcels of land to be purchased were appreciating at over 100 percent a year.

Because you are a former mayor, Mr. Chairman, I know you understand the problem of rapidly appreciating land prices and the detrimental effects they have on highway construction.

My suggestion for this program would increase the authorization from its current level of $300 million to $900 million and establish a graduated interest rate repayment schedule. For example, in years one through five the loan could remain interest free, and in years six through ten the interest rates could be increased by 1 percent a year to a maximum of 5 percent.

The purpose of this schedule is to encourage States to repay the loans as rapidly as possible. Interest fees collected could be used to cover administrative costs of operating the program, and any excess would be used to make additional loans.

I would also recommend that the program would be extended to cover the purchase of rights of way for mass transit corridors and station stops as well as for park and ride type parking lots. This will provide an additional incentive for mass transit ridership, ride sharing, and other transportation strategies.

Mr. Chairman, I have more to say, but let me just end by saying I thank you and the committee for this opportunity and encourage the committee to carefully examine these issues. I think in the new reauthorization bill it is absolutely important that there be an emphasis with regard to urban and suburban areas.

Thank you very much for this opportunity.

Mr. MINETA. Thank you very much, Congressman Wolf.

During the committee's consideration of legislative proposals for the post-interstate surface transportation program, urban congestion will be a key focus. Your bill, H.R. 961, authorizes, as I understand it, $2 billion per year over a four-year period for capacity expansion purposes in urban areas.

I'm wondering if your proposal for the acquisition of right-of-way for future construction of mass transit facilities would also consider the feasibility of the construction and operations of the mass transit facility along that urban interstate route?

Mr. WOLF. Yes, Mr. Chairman. If you wanted to use my district, for example, you could use it to acquire stations along the Dulles Access Road, or you could use it to acquire park and ride lots along the Dulles Access Road to tie into the highway program. That is the purpose of it.

Mr. MINETA. What about the mass transit facility, itself? Other than the amenities that go with the mass transit facility, would the

construction and operation of that also come out of this $2 billion pot?

Mr. WOLF. No. As of now, Mr. Chairman, unless the pot were larger, it would only be for land acquisition. Right now in the revolving fund there is only an authorization for $300 million. We propose that authorization be increased to $900 million. I think because the cost of constructing or operating the system may be very extensive $900 million may not be enough. You could do that if you were to authorize more, but basically it is the land acquisition costs which are escalating.

Mr. MINETA. Thank you very much, Mr. Wolf. And also thank you for being really a leader and innovative in terms of what is happening in that Northern Virginia area since I am one of the commuters that you spoke of earlier.

Mr. WOLF. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Shuster?

Mr. SHUSTER. Thank you very much.

We certainly appreciate your testimony, once again, and your innovative ideas. Frank, where would you propose that the $2 billion come from? I see that it is out of the Highway Trust Fund, but where would you take it from? From the rural areas, or from——

Mr. WOLF. No, not necessarily. The $2 billion would be triggered in as the interstate is finished around the country. Once an interstate program is finished and there would be the excess money, many of the States are now donor States that are not getting very much in the urban and suburban areas. For instance, the delegation from Ohio has that problem.

So as the interstate is finished, the money would be redirected.

Mr. SHUSTER. What are we spending on interstate annually now? About $2 billion?

Mr. MINETA. About $3.15 billion.

Mr. SHUSTER. So you are suggesting that of the $3.5 billion a year that we are spending on interstate that $2 billion of that go to this urban congestion program.

Mr. WOLF. As the interstate is finished I think the money should be redirected. As the interstate is still being constructed, there ought to be at least $2 billion from other sources directed toward the urban and suburban areas.

Mr. SHUSTER. What about the problem, however, of maintaining the interstate? That is a very serious problem?

Mr. WOLF. That is very, very important, and clearly that would be—that is why I also made the recommendation, Mr. Shuster, of the use of tolls which would enable construction of the new highways, as you talked about earlier. I think clearly the maintenance of the interstate is very, very important. There are some that are falling apart. Fifty percent of our bridges are falling apart.

Mr. SHUSTER. I think that is a very thoughtful proposal, and I think, as part of a whole national system, we could well find ourselves directing some money in this way. I thank you very much.

Mr. WOLF. Thank you very much, Mr. Shuster.

Mr. MINETA. Mr. Clement?

Mr. CLEMENT. Yes. Congressman Wolf, some members of my staff I know live in your Congressional district, and I know it is a real hassle. To travel ten miles can take over an hour in commuting

time to get to work. What about the Metro rail? Has that proven to be satisfactory or has it been somewhat disappointing in solving the problem?

Mr. WOLF. Metro has been extremely successful. I believe it has the highest return rate at the fare box of any metro system in the country. It received the American Public Transit Association award last year for being one of the best-run systems in the country. It has been very, very successful.

We are working to finish it. We are at 89 miles. The full system will be 103 miles. Eventually, the hope is to develop a light rail system which will connect the West Falls Church stop, go down the median strip of the Dulles Access Road to Dulles Airport to have open-air stops at Wolf Trap, open air stops at Reston and Herndon going into the Dulles Terminal to connect both Dulles Airport and National Airport with mass transit.

It has been very, very successful.

Mr. CLEMENT. What about expanding the service out at Dulles Airport in order to alleviate much traffic and congestion?

Mr. WOLF. Well, Dulles has expanded quite dramatically. In 1981 Dulles had 2.1 million passengers. Partially through the leadership of Congressman Mineta and the Airports Authority, and other efforts, Dulles has now about 12.5 to 13 million passengers.

In 1981 there was only one flight a day going to New York. Now you can go literally to any place in the world from Dulles. So that is why we are hoping to have a light rail or mass transit system down the Dulles corridor which will connect the West Falls Church metro stop, basically connecting National and Dulles together and downtown Washington, all with light rail or mass transit.

Mr. CLEMENT. Thank you.

Mr. MINETA. Mr. McEwen.

Mr. MCEWEN. Thank you, Mr. Chairman.

I want to thank you, Mr. Wolf, for your testimony. Of course, all of us that are concerned about transportation needs miss you on this committee and are delighted that you are where you are on the Appropriations Subcommittee on Transportation, and also for your leadership in the entire question of transportation for our nation's capital. You are a responsible moderating influence to take the HOV lanes to three lanes and to open up the 14th Street Bridge that for 15 years was closed to traffic in the morning and backed up an additional ten miles. As you mentioned, there were hundreds of millions of man hours that were lost every day in time with their families and elsewhere, and your decision to put in the legislation to open that up has made a tremendous impact on that each morning.

And for all of these suggestions that you make because of your leadership and because of your respect and the commonsense, practical approach that you have had to transportation needs for so long, you will certainly not only receive a receptive ear, but many of us that want to help.

The outer bypass, if we were to start today, would perhaps be a decade off. We are late. It needs to be started. We need to go. I appreciate your leadership on it and pledge my support.

Thank you for your testimony.

Mr. WOLF. Thank you very much.

Mr. MINETA. Mr. Sangmeister.

Mr. SANGMEISTER. No questions.

Mr. MINETA. Mr. Duncan.

Mr. DUNCAN. I don't have any questions, but, like Congressman McEwen, I'll just say simply that, as a resident of Northern Virginia, I'm glad we have got Congressman Wolf fighting to improve the transportation system. I think the citizens of your area are very fortunate to have you represent them. Thank you very much.

Mr. WOLF. Thanks, Mr. Duncan.

Mr. MINETA. Mr. Payne.

Mr. PAYNE. Thank you very much, Mr. Chairman. I also would like to commend my colleague from Virginia for the fine job that he is doing for transportation not only in his district but for transportation all over our State, and to say that while I represent a very rural area of Virginia, the urban congestion problem is one that not only affects urban and suburban areas, but our rural areas, as well, indirectly and somewhat directly. So I think this is a very important issue and one that we need to pay a great deal of attention to as we go through the reauthorization process.

Thank you for the good work that you do, Frank.

Mr. WOLF. Thank you.

Mr. MINETA. Mr. Applegate.

Mr. APPLEGATE. I have no questions, Mr. Chairman.

Mr. MINETA. Mr. Visclosky.

Mr. VISCLOSKY. Mr. Chairman, I don't have any questions.

I just want to commend you, Mr. Wolf. I think you have been very thoughtful. I think you have been innovative in some of your ideas. Certainly, as far as your proposals pending before this subcommittee, they will receive my serious consideration. Thank you.

Mr. WOLF. Thank you very much.

Mr. MINETA. Thank you very much, Congressman Wolf.

Mr. WOLF. Thank you, Mr. Chairman.

Mr. MINETA. I appreciate your innovative ideas over a period of time.

[Mr. Wolf's prepared statement follows:]

STATEMENT OF CONGRESSMAN FRANK R. WOLF

Before the Surface Transportation Subcommittee
on
Reauthorization of the Federal Interstate Highway Program
March 13, 1990

Mr. Chairman, I appreciate the opportunity to testify before your subcommittee on what clearly is one of the most critical issues facing our country: our surface transportation system.

Over the course of these hearings you will hear many statistics about our nation's transportation system. These statistics don't begin to tell the story, however, until they are put into real terms.

In the area I represent, northern Virginia, reality is work days that begin before 5 a.m. and which don't end until nearly 7 p.m. -- all because of traffic congestion. Reality in my area is long hours spent in congestion on I-66, the Capital Beltway and other highways -- hours which could be spent with family or used productively at work.

I could go on and on, but the point is clear: transportation -- specifically traffic congestion -- is a top issue in northern Virginia and in many other urban and suburban areas of the country.

This highway reauthorization legislation is a unique opportunity and we as a nation need to respond to the challenge.

GRIDLOCK RELIEF FOR INTERSTATES PROGRAM

The current federal highway program does not adequately address the needs of urban and suburban areas of the country which are facing high levels of traffic congestion. Any new federal highway program must address this problem.

Legislation I have introduced, cosponsored by a bipartisan group of 55 members of the House, including seven members of this subcommittee, would directly address this problem by allocating federal funds to urban and suburban areas of the country to expand the capacity of congested highways.

Northern Virginia typifies the problems that are faced by many urban and suburban areas of the country and tens of millions of individuals each day. In northern Virginia, interstate highways such as I-66, I-395, I-495 and even I-95 near complete gridlock during peak periods. The result is that commuters can't get to work and commerce can't flow.

The GRIP legislation would provide formula grants, estimated at $53 million a year for Virginia, that would allow I-66 to be

widened and bottlenecks on the Capital Beltway to be removed. The funds could be used to widen or even double-deck the Wilson Bridge.

I use Virginia as an example, but GRIP funds would be available to and could help all urban and suburban areas of the country. Los Angeles would benefit from this proposal as would New York, Chicago, Miami, Houston and any other area of the country where traffic congestion has clogged interstate highways.

The formula we have developed would target funding, at a rate of $2 billion a year, to the most congested areas. Funds would be allocated according to a formula that considers the number of lane miles in an urban/suburban area as well total vehicle miles travelled.

Many cities as well as a number of states have endorsed our proposal. I have attached for the record, a list of organizations supporting GRIP.

I recognize that additional highway capacity is only part of the solution to urban/suburban traffic congestion. It is an important part but we also must ensure that adequate mass transit facilities are available. For that reason, the GRIP bill, H.R. 961, specifies that funds could also be used to acquire rights-of-way for mass transit facilities and for land for park-and-ride-type lots.

A balanced transportation network requires effective mass transit systems. We must provide an emphasis on mass transit and other transportation strategies that take cars off the road. In northern Virginia, for example, the Metro rail system carries hundreds of thousands of commuters each week. Without it, our region would be choked in traffic.

An efficient and effective transportation system is critical to preserving our nation's environmental quality. Traffic congestion has been documented as a major cause of increasing air pollution. The GRIP legislation, by reducing traffic congestion, could help lessen air pollution in our urban and suburban areas.

Noise pollution is another growing concern. GRIP funds can be used for highway noise abatement devices such as sound walls to help reduce noise pollution.

The provisions of H.R. 961 are not sacrosanct. Some provisions, the formula for example or the scope of highways covered, may need alteration. I believe very strongly, however, that the new highway bill must -- absolutely must -- include provisions which address the growing problem of urban/suburban traffic congestion. H.R. 961 has focused attention on this problem and has generated discussion on the best way to attack it and I believe it provides a useful framework for addressing the congestion problem.

FEDERAL ASSISTANCE FOR NEW TOLL HIGHWAYS

GRIP or similar provisions which provide for expansion of existing highways are part of the solution to congestion problems. Another part of the solution is the construction of new highways.

In northern Virginia, for example, we desperately need an outer bypass highway. A bypass highway, which would cost an estimated $3 billion, would divert as much as 33 percent of north/south bound I-95 traffic that now must travel through the Washington metropolitan area. Thousands of cars and trucks now travelling from Florida to New York or from North Carolina to Massachusetts would be diverted from the Capital Beltway, the Wilson Bridge, I-95 and I-395 and other area highways dramatically reducing traffic congestion in the region.

Many other areas of the country also have a great need for the construction of new highways. With limited local, state and federal funds available for their construction, however, these roads will remain on the drawing board and traffic congestion will continue to increase.

Because of the great need for new highways and the lack of any source sufficient to meet the price tag for these roads, I will be introducing legislation shortly that would allow federal funds to be used with state, local and private funds to construct new toll highways. Current federal law does not permit federal funds to be used in the construction of new toll highways.

Using the Washington Bypass example, once the governors of Virginia and Maryland choose an appropriate route for the bypass, available federal funds could be combined with state and local funds and bonds could be floated to begin construction of the road.

The use of bond financing would allow all of the necessary funds to be obtained at one time so that construction could begin early and be completed quickly. Most experts agree, there is no faster way to begin and complete construction of important and badly needed new highways than to use toll financing and I believe it is appropropriate that federal funds be used in the process.

The use of federal funds in the construction of toll highways is supported by the American Association of State Highway and Transportation Officials (AASHTO) and other organizations and has been suggested by the Administration in its national transportation strategy.

LAND ACQUISITION FUNDS

My last suggestion concerns the federal right-of-way revolving fund which makes interest-free loans, repayable in two to 10 years, to states for the purchase of rights-of-way in advance of highway construction. The purpose of this program is to help states and localities avoid the impact of inflation of land prices in areas of rapid appreciation.

Last year I was successful in obtaining approval for a loan from the revolving fund for the state of Virginia and Fairfax County to purchase parcels of land for the Fairfax County Parkway. That loan will save Fairfax County and the state of Virginia tens of millions of dollars because the parcels of land to be purchased were appreciating at over 100 percent a year.

Because you are a former mayor, Mr. Chairman, I know you understand the problem of rapidly appreciating land prices and the detrimental effect they have on highway construction.

The right-of-way revolving fund has been a very effective program with strong benefits to everyone involved, especially states and localities that could not otherwise afford to purchase the land necessary for highway construction.

My suggestion for this program would increase the authorization from its current level of $300 million to $900 million and would establish a graduated interest-rate repayment schedule. For example, in years one through five the loan could remain interest-free and in years six through 10 the interest rate could increase by 1 percent a year to a maximum of 5 percent.

The purpose of this schedule is to encourage states to repay the loans as rapidly as possible. Interest fees collected could be used to cover administrative costs of operating the program and any excess could be used to make additional loans.

I would also recommend that the program be extended to cover the purchase of rights-of-way for mass transit corridors and station stops as well as for park-and-ride-type parking lots. This will provide an additional incentive for mass transit ridership, ridesharing and other transportation strategies.

CONCLUSION

Mr. Chairman, I want to congratulate you for holding these hearings. This committee faces a difficult but important task that will affect the future of our nation as well as each of its citizens.

Our nation depends on a sound infrastructure as the foundation for competition in the world market. A clogged, deteriorating transportation system will make it difficult, if

not impossible, for the United States to effectively compete in an increasingly competitive global marketplace.

Gridlock relief on existing highways and mass transit alternatives are imperative as is construction of new roads. These are essential to maintaining our competitiveness.

They are also essential to maintaining the quality of life the people of our country have come to expect. A good transportation system means more time to spend with family and friends and more timc to be used productively at work or other undertakings.

I encourage the committee to carefully examine the proposals I have made here this morning. They will make a difference. They will help reduce congestion so that commuters can get to work faster and so that commerce can flow. I appreciate your attention and will be happy to respond to any questions you may have.

####

GRIDLOCK RELIEF FOR INTERSTATES PROGRAM (GRIP)

H.R. 961

Summary: The Gridlock Relief for Interstates Program (GRIP) provides federal funding to be used to expand the capacity of interstate highways in urban and suburban areas of the country. GRIP authorizes $2 billion per year from the Federal Highway Trust Fund. These funds can also be used for sound abatement, park-and-ride-type lots, and acquisition of land for mass transit facilities.

Mr. MINETA. At this time I would like to call forward a very distinguished panel of our colleagues from the great State of Ohio: Congressman Louis Stokes, Congresswoman Mary Rose Oakar, Congressman Donald J. Pease, Congressman Michael DeWine. Congressman Clarence Miller and Congressman Dennis Eckart are not able to be here with us, but their statements will be made a part of the record.

[Mr. Clarence Miller's prepared statement follows:]

STATEMENT OF REPRESENTATIVE CLARENCE E. MILLER

Thank you, Chairman Mineta and Members of the House Surface Transportation Subcommittee. It is a distinct pleasure to offer my comments on the reauthorization of the important Surface Transportation Act. My remarks are intended to bring to your attention some of the problems we face in smaller communities and in the rural areas, as well as to express my support for the Ohio delegation's request for constructive changes in the highway minimum allocation program.

I wish to thank the Ohio delegation for their support in adding the Ironton-Russell Bridge on State Route 93 to the list of priority structures eligible for federal discretionary highway funding.

For a very large area such as the 10th Congressional District of Ohio, highways are our lifeline—we simply cannot survive, let alone compete in today's markets, without safe reliable roads and bridges.

I am concerned that as a nation our spending on public works (as a percent of GNP) has decreased from 2.3 percent in 1960 to less than 1.1 percent in 1985. This places the U.S. fifty-fifth in the world—far below our competitors—in rate of investment in vital infrastructure.

For every public dollar spent on an annual basis to build and maintain our network of roads, streets and bridges, the private sector currently spends $15 to move people and goods.

We know that appropriate public investment increases the productivity of that $15 to $1 private investment. Yet private sector capital investment increased by about 51 percent between 1975 and 1985, while public works investment fell by more than 6 percent over the same period.

This growing imbalance between public and private investment means that we are not getting as much value as we could from private capital investment. As a result, industry must substitute its own private capital and labor for inadequate public infrastructure. In other words, firms compensate by using more capital and labor to produce the same output.

This situation is exacerbated in donor states such as Ohio, which get the lowest possible return on their federal gas tax dollar. In appalachian areas such as my District, the private sector simply does not have extra private capital available to make up the difference when public investment in highways and bridges falls short.

Furthermore, because we get the lowest possible rate of return on our federal highway taxes, we are forced to contend with increasing state gas taxes.

Ohio has raised its state gas tax 6 times in the last 10 years, from 7 cents a gallon in 1980 to 18 cents a gallon in 1989. An additional increase of 2 cents a gallon goes into effect July 1 of this year. The impact of these increases is a tripling of the state gas tax—over and above the 1982 federal increase to 9 cents a gallon.

Ohio also has issued bonds for infrastructure repair, and been forced to establish a mechanism which allows collection of higher vehicle registration fees.

As a result, Ohio taxpayers bear an extraordinary double tax burden for highways and bridges. Ohio taxpayers continue to get the poorest possible return on their federal gas tax, and must contribute proportionately higher taxes at the state and local levels.

This double tax burden is especially hard on the Appalachian wage earner on small- and medium-sized businesses in my region of the State. Federal and state sales taxes on motor fuels are regressive. In areas such as southeast Ohio, it is not unusual for families to have to pay as much to keep a vehicle running as they pay for housing.

For these reasons, current highway funding distribution practices put low income and rural areas in donor states at a severe disadvantage:

We pay more in federal gas taxes and user fees;

We get less back from the Highway Trust Fund for our roads and bridges,

We must make up the difference in higher state and local taxes, and

We operate at a great disadvantage in attracting private investment and new employment.

This inequity amounts to billions of dollars. It puts donor states at a significant competitive disadvantage compared to non-donor states in attracting private sector investment, and making that investment productive. This inequity costs us jobs, income, and tax base.

For these reasons, current federal transportation funding policy accelerates the downward spiral of depressed areas, and makes it even more difficult for small and medium-sized businesses to survive and compete successfully.

I was surprised to discover that 18 other states now find themselves in the same situation as Ohio. More than half the U.S. agricultural production, more than half the U.S. manufacturing production, and more than half the service industries in the nation are located in donor states.

These businesses, and more than half the taxpayers in the nation, are located in states which—for all practical purposes—must endure a 15 percent loss on their Highway Trust Fund contributions.

To make matters worse, federal gas tax dollars are not being invested where they are most needed. More than 64 percent of the nation's most deficient rural highway mileage is in states which get the lowest rate of return on their federal gas taxes. More than 65 percent of the most deficient interstate mileage is located in these same states.

I am pleased that the Administration has proposed some changes to the program. However I am concerned about the recommendation for increasing the non-federal match requirement for road and bridge projects. I agree with the Council on Public Works Improvement that there must be reasonable limitations to the user fee principle. Many smaller communities lack the financial base necessary to finance infrastructure facilities. This is especially the case when new capital investment is required.

For these reasons I strongly support the Ohio delegation position that the Minimum Allocation program be raised from 85 percent to 90 percent and that discretionary funding be awarded to all states without penalty.

While a sound infrastructure does not absolutely guarantee future prosperity, there is no doubt that long-term economic development and growth cannot be attained without it. A sound highway system is the framework upon which the economic health of rural Ohio depends.

With this testimony, I am urging the Subcommittee to give serious consideration to the points noted by the Ohio delegation in general, and specifically, to those items in this legislation of special significance to Ohio's non-metropolitan areas.

Thank you for your consideration of my views.

[Mr. Eckart's prepared statement follows:]

TESTIMONY OF THE HONORABLE DENNIS E. ECKART
BEFORE THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
MARCH 13, 1990

Chairman Mineta and Members of the Surface Transportation Subcommittee, it is an honor to appear here before you today with fellow members of the Ohio delegation.

I strongly support the delegation requests for an increase in the Minimum Allocation Program from 85 percent to 90 percent, and restoration of equal access for all states to discretionary transportation funds.

There are two major reasons for my support of this position, and my views on some of the other issues you face in preparing a Surface Transportation reauthorization bill.

First, my involvement in the development of clean air legislation has convinced me that urban traffic congestion poses one of the most severe threats to our environment. However, I am also convinced that we can solve a major portion of this problem without breaking the bank if federal highway and transit programs are redirected.

Before I share the basis for my optimism about reducing congestion, I feel compelled to point out that existing federal transportation funding practices helped create the current congestion problem.

Approximately 91 percent of all U.S. urban freeway delay occurs in only 37 urban areas. Twenty-two (22) of these 37 metropolitan areas--about 60 percent of all the areas having the worst traffic congestion and worst mobile source air pollution--are located in the 19 Minimum Allocation states. In fact, 6 of the top 10 most congested areas are in these donor states.

What is even more remarkable is that this trend--concentration of the severest traffic congestion and worst air quality in donor states--is expected to continue well into the next century.

This trend is likely to continue, even if many of the measures being considered in various clean air proposals are implemented.

This trend could possibly be reversed if funding formulas are revised so that federal aid is better directed to areas which genuinely have the greatest need for assistance.

Specifically, formulas need to be changed so that more federal funds go to urban and suburban areas. That is where most of the taxpayers, most of the vehicles, and most of mobile source pollution are located.

These funds should be distributed in a manner which allows and encourages the kind of flexibility necessary to significantly reduce traffic congestion. Within a given corridor, local and state officials should be able to develop solutions which involve a combination of traffic flow, transit, and highway capacity improvements.

U.S. DOT statistics indicate that urban freeways, which carry about 30 percent of all urban traffic, are particularly affected by increasing traffic congestion. Urban freeway travel is expected to grow by 49 percent in the next 15 years.

Urban freeway congestion annually results in over 2 billion vehicle-hours of delay, over 1.3 billion gallons of wasted fuel, and over $9 billion in increased user costs. These figures are predicted to grow to 6.9 billion vehicle hours of delay, 7.3 billion gallons of wasted fuel, and over $50 billion in costs by the year 2005. That is an increase of more than 400 percent in the next 15 years.

This is not a problem we are going to be able to "build" our way out of. In fact, for many congested freeways in the nation, the widening of roads is not a feasible alternative.

Let me explain why I remain optimistic that a redirection of federal highway investment can make a significant contribution to solving this problem. A study undertaken by the Federal Highway Administration in 1984 indicated that:

-- Significant and cost-effective reductions in traffic congestion are possible when a combination of low-cost geometric improvements, traffic surveillance and control, and roadway widening is implemented;

-- Adding demand reduction programs, such as transit and ridesharing, to this combination has great potential to enhance traffic flow at reasonable cost;

-- Combining widening, traffic surveillance and control measures, and low-cost geometric improvements with demand reduction techniques works best. Such a strategy has the potential to reduce recurring congested travel by 55 percent, reduce recurring delay by 67 percent, reduce incident delay by 63 percent, and reduce cost of congestion by 64 percent.

Although this study was done 6 years ago, I believe it provides some basis for hope in finding a cost-effective solution to mobile source pollution and the escalating national costs of traffic jams and gridlock.

But such solutions are possible only if sufficient federal funding is assigned to undertake the types of solutions described. For this reason, I urge this panel to consider increasing the amounts authorized for the federal urban program.

I also urge that formulas be corrected so that funding goes where it is most needed. Forcing donor states to endure another five years of underinvestment is not in the best interests of either the nation's economy or our environment.

Rural highway aid should be directed to areas experiencing the greatest traffic and safety problems. Current formulas do not always do this.

Another issue I suggest the panel consider, and the second reason for my support of the Ohio delegation position, is the need to revise federal policy related to construction of new Interstate interchanges.

Ohio has some of the longest stretches of Interstate mileage without access. I shall insert a copy of a map for the record to illustrate this fact.

As you will see from this map, the very limited access to the Ohio Turnpike, in turn, limits the productivity of many other Interstate Routes, including I-71,I-77 and I-90.

A number of outer ring suburban areas are all but prohibited from gaining access to Interstate Routes due to a federal policy which fails to recognize the vast amount of development which is occurring around major metropolitan areas.

The touchstone of effective transportation policy is based on land use. U.S. DOT policy must be reformulated to accommodate the reality of changing suburban landscapes and travel patterns.

To this day, because of such restrictive policy, and the incredibly long periods of time it takes to get an interchange designed and approved by U.S. DOT, one of the most heavily travelled north-south routes in my district (SR 615) is still not connected to Interstate Route 90.

I-90 is the only east-west Interstate Route linking the largest cities in Ohio's 11th Congressional District to Cleveland and Pennsylvania.

Representatives Pease, Kaptur, Gillmor and others can verify that this type of problem exists all over Ohio. It is undoubtedly a problem in other states also.

In addition, I am submitting for the record an article detailing the FHWA study on methods of solving traffic congestion problems. I think you will find it informative.

Thank you very much for the opportunity to testify today.

Mr. MINETA. At this time I would like to call on our colleague, Congressman Lou Stokes.

TESTIMONY OF HON. LOUIS STOKES, HON. MARY ROSE OAKAR, HON. DONALD J. PEASE, AND HON. MICHAEL DEWINE, REPRESENTATIVES FROM OHIO

Mr. STOKES. Thank you very much, Mr. Chairman and distinguished members of the Surface Transportation Subcommittee.

On behalf of the Ohio delegation, I want to thank you for giving us the privilege this morning of appearing before you.

The subject we will be discussing today, reauthorization of the Highway Surface Act, is one of the most serious issues facing my State and one of the most serious issues facing our nation.

Mr. Chairman, I want to start by congratulating you for the outstanding job you do as chairman of this committee. Our three fellow Ohioans on this committee speak very highly of both your leadership and the good work of this committee.

The members of the Ohio delegation have attempted to coordinate our statement so that the positions we present to you are consistent, unified, and comprehensive. We have undertaken an effort of many weeks to coordinate our statements with the views held by our local elected officials and the Ohio Department of Transportation. We have also worked extensively with our Governor, Richard Celeste, who is slated to appear before this committee next week.

Our statements are intended to be considered en bloc, and although each statement addresses a somewhat different aspect of transportation, there is agreement on our basic recommendations.

Mr. Chairman, I and other Members from Ohio appreciate the efforts that this subcommittee has made to try to change some of the outdated formulas used to distribute Federal highway aid. We appreciate your assistance in creating the minimum allocation program. Without this supplement to existing formulas, many of us could not have supported the nickel gas tax increase in 1982. However, I have several concerns regarding the way Federal highway aid is distributed.

Although the minimum allocation guarantee has been of great benefit to donor States, it still forces the same set of States which have carried the greatest burden for the national highway program to continue subsidizing other States. I am also particularly concerned about the impact of Federal highway programs on people with low incomes. The Federal gas tax and various other user fees which support Federal transportation programs are very regressive. These taxes and fees place an extraordinarily heavy burden on persons with low income. In addition, the regressive nature of these taxes have been amplified by erosion of the Federal commitment to repairing city and rural roads.

Neither the rural secondary nor the urban highway program was given any increase at all in authorized funding when the nickel gas tax increase was enacted. Yet, to participate in any meaningful way in today's society everyone needs access to either gas or public transportation.

Suburban sites accounted for 47 percent of all metropolitan job destinations in 1980. This percentage is expected to rise significantly by 1990.

Low-income inner-city residents must have increased access to suburban employment opportunity if we are to break the cycle of urban poverty. There simply are not enough jobs available paying more than minimum wage in city neighborhoods and downtown areas. Lower income households with a working parent or adult have very complicated home-to-job travel patterns which often include stops for day care, social services, medical care, and job training. Such multi-destination trips are exceedingly difficult, increasingly expensive, and very time consuming to undertake on even the best of public transportation services.

While public transit will always be a necessity, the low-income employed face dramatic costs for car ownership and pay a disproportionately large share of their income on auto-related user fees and gas taxes. Yet, Federal highway programs continue to direct the majority of their investment to interstate and primary system highways. In my view this policy works at cross purposes to many of the training, education, trade, and competitiveness initiatives Congress and the Administration have undertaken.

The studies performed by the General Accounting Office and other agencies confirm that some of the factors used in highway funding distribution formulas are not even closely related to today's highway system. Some factors used to distribute Federal highway funds have gone unchanged since 1916. Others have not changed for more than 40 years.

Formulas which emphasize land area and postal route mileage are especially unfair to urban areas and to low-income city residents.

Mr. Chairman, I understand the difficulty in revising formulas which distribute Federal aid—and especially when no new tax revenues are available to assure that all parties are held harmless by any changes. Nonetheless, I am compelled to recommend that we continue bringing some of the highway formulas up to date and to correct the inequities in distribution of a very regressive Federal tax.

Even if the next act substantially changes the categorical programs, the types of factors I have outlined should be used. If this is not possible I support the delegation request for increasing the minimum allocation program from 85 percent to 90 percent. Certainly equal access to discretionary funds without penalty should be a part of the next authorization bill.

I thank you, Mr. Chairman.

At this time I would like to yield to the distinguished member of our delegation from Cleveland, Mary Rose Oakar.

Ms. OAKAR. Thank you, Congressman Stokes.

As you know, Mr. Chairman and distinguished members of the committee, and the distinguished minority leader of the committee, the dean of the Ohio delegation and come before this committee in a bipartisan way on behalf of our State. I think that is very important to emphasize. We are proud of the Ohio members and other members of this committee.

I don't know of any committee that is more important than the Public Works Committee today. I do not see how we can become competitively active as a nation globally and domestically if our bridges and our roads are in terrible disrepair and if we need new construction, as well. So I really think you are the anchor issue of this generation in terms of our needs, and I know, Mr. Chairman, under your leadership we will see some changes. Our nation's economic future directly relates, in my judgment, to this committee.

Mr. Chairman and members, I want to say how grateful I am personally for the crafting of the innovative provision of Chairman Jim Howard and his cooperation with us relative to the 1982 Service Transportation Assistance Act. We were getting $0.61 for every $1 our State gave in, and now we get $0.85. That was a big change, and we are grateful for that.

We had never gotten discretionary funds except for one bridge at that time. We have gotten a few more, and we are grateful for that.

But the donor State status is more than a generation old, as Congressman Stokes has indicated—and we know that it is hard to change things around here, and we don't want to decrease any other State because I think the whole nation is in severe need relative to the problem—but Ohio does have the third-most need in the country.

I was struck, Mr. Chairman and my colleagues, by the testimony that proceeded me. It was very instructive because many of the members were asking you for new construction, and I think that is important. Our need is large, but it is especially great in the area of repair. We are on the cutting edge of the 23 percent of the nation's bridges that are structurally deficient. By the report in 1986, 19 percent were considered functionally obsolete. And, of course, Ohio has the third-most need.

As a matter of fact, the national concern shows that 55 percent of the nation's deficient bridges are in States receiving the least Federal funding for bridge repair based on their contributions.

I would like to submit for the record a list of ten bridges for the committee's consideration for discretionary funding, which is another part beyond the formula. But I want to just talk about Ohio's need. One bridge in every ten in our State is structurally deficient, one bridge in three is more than fifty years old, one in ten is more than ninety years old, and one in five should be replaced.

If you just took the five-county area surrounding Greater Cleveland, $1.6 billion would be needed to repair or rehabilitate or replace these bridges.

You might say, "What is your State doing about this?" I think this is significant. Our people in Ohio pay $0.20 a gallon for the State gasoline tax, and it is steadily increasing every year since 1980. So they pay that plus the $0.09 per gallon for Federal tax. So we really do contribute. Plus, we have license plate fees and bond issues, like my own city of Cleveland, that has been on the ballot.

Our State is really trying to do its share, but we need some help from the Federal Government, as well, because it truly is a national problem.

I ask unanimous consent to submit my entire statement for the record at this point because I want to abbreviate and give two solid recommendations, if I can.

Beyond the recommendation of the dean of our delegation that we increase the contribution—the Federal Government's contribution—to 90 percent, which is a modest increase, I would like to suggest two things.

I think that this committee should have a categorical program for bridge repair—a set-aside for bridge repair. We have seen the disasters in this country and States throughout the country. I don't have to tell you, Mr. Chairman, about disasters in States where the bridges collapsed. I think we are going to see many lives lost if we don't do something about this bridge repair. So I would like to see a separate category for that area. Certainly that would assist my State since we have the third-greatest need in the country, as well as other States.

You ask where we are going to get the money. Well, the trust fund. The Highway Trust Fund, as I understand it, collects $1 billion in interest, and I would just say to give us the interest. We will take the interest. Or take that interest and target it for those States that are not getting their fair share and have the greatest need.

It is not just my State I am talking about. I am really talking about other States and other areas and other communities, as well.

So I am committed to support this committee toward a safe and decent infrastructure in this country, and I commend the committee for giving it such high priority, and I commend the committee members who have the occasion to sit through these hearings because you hear all the horror stories and you are very conscientious in the work you do. I am here on behalf of my constituents in conjunction with my colleagues to say we support you. This is a very important priority and we support you.

I hope you will heed our call, as you have in the past. We will accept the challenge that hopefully our testimony has given you.

Thank you, Mr. Chairman and members of the committee.

Mr. MINETA. Thank you very much.

At this time I would like to call on our fine colleague from the powerful Ways and Means Committee, Congressman Don Pease.

Mr. PEASE. Thank you very much, Mr. Chairman and members of the committee. It is a pleasure for me to be here with my distinguished colleagues from Ohio to testify about the formula for distribution of Federal highway aid money.

I would like to talk for just a few minutes this morning with you about the formula and equity and the minimum allocation language.

You will recall that when the proposal to raise the Federal gas tax was enacted in 1982 a number of us in highway donor States—that is, States that have contributed far more in gas tax than we ever got back in highway apportionment—strongly urged that some guaranteed minimum return be incorporated into the legislation.

I must say the committee was very generous in responding to that request. As my colleague, Mary Rose Oakar—who was very, very active at that point in calling the attention of the committee

to that need—has already said, we used to get 61 percent, and the committee went with an 85 percent minimum allocation.

Many legislators assume, based on this guarantee and the amendments passed in 1987, that donor States get close to a fair share of their gas tax dollars back. Although we certainly do better as a percentage than we did before MA was enacted, we still lose about as many dollars to the Highway Trust Fund as we ever did. In fact, since 1982 the donor States have contributed more than $32 billion to the rest of the nation. As one of my local elected officials put it, "One of Ohio's major exports is cash."

Let me skip over some pages and say that at the time the minimum allocation guarantee was enacted none of us foresaw that there would come a day when it would directly affect more than half of all Americans. Unfortunately, that day has come. As our use of gasoline and highways has escalated, highway obligation ceilings have been decreasing. As a result, there are now 19 States in the minimum allocation program, and this number is expected to increase unless changes are made in how Federal highway funds are distributed.

At the time the minimum allocation program was enacted, none of us anticipated that this guarantee would act not as a floor, as was the intention, but as a ceiling on the amount of Federal funds that could be allocated to any State. The fact is that today more than half the deficient highways in this country and more than half of the deficient bridges in this country are, for all practical purposes, locked out of Federal discretionary funding.

Mr. Chairman, I am still skipping over to try to save you some time.

Without question, factors in formulas used to distribute Federal funding should be reexamined. Many are seriously out of date.

I and my fellow members of the Ohio delegation agree with the GAO, the National Association of State Highway and Transportation Officials, and many recognized experts in highway safety and finance: factors which reflect need, use, system expense, and condition should be incorporated into distribution formulas.

Short of that, as my colleague Mr. Stokes has said, and given the difficulty inherent in changing formulas when budgets are constrained by deficit problems, we are requesting that the minimum allocation program be increased from 85 percent to 90 percent, and that all States, including donor States, be allowed to accept discretionary funds without penalty.

Mr. Chairman, more than half of the roads and bridges in this country most in need of repair are ineligible for discretionary assistance because of existing law.

Mr. Chairman, I could go on, but you have my full testimony and you will be hearing from other members of the Ohio delegation. Let me just say again, as my colleagues have already said, that we come to you seeking greater equity in the highway fund allocation formula. We also come to you in gratitude for the consideration that you have shown to Ohio and other donor States in the past.

Number one, we appreciate your generosity in the past, and we hope that you will consider seriously these further changes which we are suggesting to you today.

Thank you very much.

Mr. MINETA. Thank you very much, Congressman Pease.

I now call on our fine colleague, Congressman DeWine.

Mr. DEWINE. Thank you very much, Mr. Chairman. It is good to be with my colleagues from Ohio, Mr. McEwen and Doug Applegate.

I appreciate the chance to be here to talk today about what we consider to be the inequity in the distribution of Federal highway funds under the current system.

Current Federal aid highway formulas fail to allocate funds to the areas which need them most. Under this system my State, Ohio, receives only 85 percent on the dollar on its contribution to the Federal Highway Trust Fund. In fact, Ohio is only one of nineteen donor States which receive the 85 percent statutory minimum of their Federal highway contributions.

Current apportionment formulas fail to support and advance our nationally-recognized trade and competitiveness goals. U.S. Government statistics indicate that 11 percent of all U.S. labor force hours are spent in some form of highway travel and that commercial vehicle travel is expected to increase by 30 percent in this decade, alone.

In addition, transportation costs, which constitute as much as 25 percent of product prices for some industries, play a major role in the ability of States to compete successfully in today's challenging global marketplace.

What all of this adds up to is that even marginal improvements in our transportation system can pay big dividends in terms of national productivity. Conversely, small inequities in Federal transportation investment have a significant negative impact on the ability of States to provide competitively-priced goods and services.

U.S. Department of Transportation statistics graphically demonstrate the cumulative effect of the inequities in current funding distribution formulas on donor States like the State of Ohio.

Ohio and the 18 other donor States contain 55 percent—more than half—of the nation's deficient bridges. The donor States contain 50 percent of total interstate system mileage, but have 65 percent of the deficient interstate mileage.

Ohio, itself, has only 3.5 percent of the total interstate system mileage, but 10.2 percent of the deficient interstate mileage.

The donor States contain 49 percent of all rural interstate mileage, but 64 percent of all deficient rural interstate miles. While an average of 15 percent of the rural interstate miles are deficient in the donor States, in non-donor States the average is only 8 percent.

Clearly, Ohio and the other donor States are footing a disproportionate share of the highway bill. Yet, it is these States that are actually most in need of assistance to maintain and restore neglected infrastructure. This is simply, in our opinion, not fair. Nor is it good public policy. This is particularly disturbing because donor States generate more than half of our gross national product and contain more than half the manufacturing, agricultural, and service base of the nation.

What this indicates is that current Federal highway investment policy is having a cumulative detrimental effect on the highway system of Ohio. This will only accelerate as structures reach the end of their design life and deteriorate. Moreover, because Ohio is

a major transportation artery, the negative effects of the funding formulas are compounded. Therefore, it is imperative that Federal highway funds be allocated in a fair and equitable manner.

Despite this need, Federal highway funds are distributed really without any consideration of the extent of the State's commercial and industrial base, its contribution to the gross national product, its contribution to U.S. export trade, or the need to maximize the efficiency of transportation. This policy directly hinders Ohio's ability to produce competitively-priced goods and services.

Ohio is a key player in U.S. efforts to increase the value of exports and keep the U.S. industrial base competitive internationally. If Ohio is to modernize its manufacturing base and increase technology-driven enterprise, it should at least have the benefit of a fair share of Federal highway aid. A competitive State must have adequate roads and bridges, truck access to port and rail terminals, and added capacity where needed in order to minimize delivery time and other transportation components of production.

For these reasons I join my colleagues from Ohio in urging this committee to increase the minimum allocation base from 85 percent to 90 percent.

If we are to modernize our economy to ensure that we can compete in the 21st century, then we must also modernize our highway distribution formulas.

Thank you very much, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. DeWine.

Mr. Pease, the three topics that you focus on in your statement—equity disparities in Federal transportation investment, keeping the U.S. competitive in world markets, and new highway capacity—tend to all gravitate toward a need for increased Federal funds for the nation's highways.

Mr. Stokes, I'd like to ask you, with regard to those topics that Mr. Pease has raised in his statement, I'm wondering, under the reauthorization legislation, would a modification of the minimum allocation apportionment which excludes discretionary funds provide the availability of the needed resources for the donor States to address their high-cost transportation projects?

Mr. PEASE. Mr. Chairman, If I might at least begin the answer, I think we have all suggested this morning that increasing the minimum allocation from 85 to 90 percent would be helpful, but that has not been our major recommendation. Our major recommendation has been for a recasting of the formula to take into account new and different factors like condition of the roads, the impact of traffic, the impact of population, and so on.

So we really hope that you will take a serious look at the formula, itself, but if that is too much for you to bite off this year, then, in terms of equity, we from the donor States think that 90 percent would be somewhat more fair to us than the 85 percent.

Mr. STOKES. Mr. Chairman, that is precisely my position. As I said in my formal statement, if you do not find that you can change the formula then, as an alternative, I would suggest moving from 85 to 90 percent as another option.

Mr. MINETA. Any other thoughts from the members of the panel?

Ms. OAKAR. Yes, sir.

Mr. MINETA. Ms. Oakar.

Ms. OAKAR. I would like to take a crack at it, Mr. Chairman.

If we were to get $1 for every $1 our people contribute, it would be about $85 million. So if you give us a 5 percent increase, one-third of that, that helps. It is a step in the right direction.

But I would ask the committee to give us special consideration for discretionary money—especially in view of the fact that we have the third-greatest need for repairs in the country.

I think there is a way to balance it out if you work it out, because I know you make recommendations for discretionary funds. That is why I submitted a list of the ten worst bridges in Ohio in terms of needs.

I know it is difficult.

Thank you.

Mr. MINETA. Thank you very much.

Mr. DeWine, do you have any additional comments you would like to make?

Mr. DEWINE. No, Mr. Chairman.

Mr. MINETA. If not I will call on Mr. Shuster.

Mr. SHUSTER. I certainly appreciate your testimony. I think you make a very strong case for looking at the formulas so that you get your fair share. I have a problem, however, with simply increasing the percent guarantee to every State from 85 to 90 for the reason that the whole concept behind the Federal aid system is to put the money where the needs are. If we simply increase this, we might as well eliminate the Federal program and let every State spend its own money.

I think your first suggestion is one that I find much more compelling.

Mr. PEASE. If I might respond, Mr. Shuster, I couldn't agree with you more. Our colleague, Frank Wolf, testified earlier and was telling me about a bill that he has in which would move Ohio up from 85 percent of what it contributes to 136 percent. That sounds like a wonderful change in the formula to me. So, clearly, increasing the 85 to 90 would not be our first choice. A more rational and up-to-date formula with some different factors would clearly be better.

Mr. SHUSTER. Thank you very much.

Ms. OAKAR. If I could respond, in my testimony—I think you had stepped out for a few minutes—I had asked the committee to consider a special, separate, categorical program for those areas in need of bridge repair, rehabilitation, or replacement. That might be a way to really target the problem.

Mr. SHUSTER. Of course, that is what the discretionary program is supposed to be. Apparently you are not getting your fair share of the program.

Ms. OAKAR. Well, you know, that's right. I would say that is very true because we really have such a critical need by way of comparison. That is why we thought we would give you the list if you could give us a little consideration.

Mr. SHUSTER. Thank you very much.

Mr. DEWINE. Mr. Chairman, I would like to add just one thing.

I think the summary from this panel would be that we do not think the current formula is correct, and it does not really reflect need adequately. We would be delighted if your committee would delve into this again. I know it is an awesome task once you start

into something like this, but we feel that Ohio certainly would benefit by a needs test with different criteria than is written into the current law. We think that the whole criteria is just out of date.

Mr. SHUSTER. If we can come up and define a national highway system that takes the place, in effect, of the interstate system, and if Ohio gets its fair share of participation in such a definition, then that would help solve the problem because, just as we provided the money for the interstate system not based on any formula but based on need, we would be providing money for a new national highway system based on need. So if Ohio were a big part of that, you would be getting your fair share.

Thank you.

Mr. MINETA. Mr. Clement.

Mr. CLEMENT. No questions.

Mr. MINETA. Mr. McEwen.

Mr. MCEWEN. Thank you, Mr. Chairman.

I want to express my gratitude to my colleagues for coming in and highlighting what is a very severe need. Also, I want to thank Congressman Pease for pointing out the major part that Ms. Oakar has played in establishing the 85 minimum first of all, which is only fairness, but then also to discover how the Federal Highway Administration has circumvented it, unwilling to accept the mandates of the Congress, and to not only have a minimum in the allocation, but then, where we qualify for special assistance—whether it be in bridges or whether it be in disaster or whether any other category—that they then come back and deduct it from what was established as a minimum, thus making it not a minimum at all.

Those of us that strongly supported Ms. Oakar's presentation back in the 1982 act are disappointed at its implementation and we hope that we can correct it in the new bill. I thank you for bringing it to our attention.

I thank not only our distinguished member of the Appropriations Committee, but Mr. DeWine, as well. I think you understand the committee is receptive. Mr. Applegate and I are grateful for your assistance. The need is great and the cause is meritorious.

I would close by making one last request, if I may, and that is that a combination of factors have come together to make it such that billions of dollars are kept in a cash drawer at OMB that are assigned, have been paid for, have been given on a daily basis every time one pumps gas into their car or whether they take a flight on an airplane with the understanding that our air transportation system will be kept safe and the latest ingredients will be given and the latest technology will be made available, and also that highways will be repaired, not at the point of destruction, but maintained at the point of safety.

There is a decision that has been made whereby our trust funds are not being used for that purpose. I have legislation, H.R. 286, which I would encourage you to join if you would see at all possible, because I think that it would correct what is a very, very severe need in our country. I thank you for that.

I have one final observation that Jackie Gillan in the Ohio office has been a great help to this committee, as well as has Virginia Ainsley and the Cleveland Area Growth Association, both of whom are vitally concerned that this correction be made.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you, Mr. McEwen.

Mr. Sangmeister.

Mr. SANGMEISTER. No questions.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. No questions.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. No questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. No questions.

Mr. MINETA. Mr. Applegate.

Mr. APPLEGATE. Thank you, Mr. Chairman.

I just want to follow up with what my good friend and colleague, Mr. McEwen, was saying, and also to comment the Ohio delegation for being here and showing the strong concern that they have. Nobody is any more aware of the needs than the four people that sit before us, and they have expressed it very succinctly. I appreciate it, and I know that the members do.

We have been talking about donor States, and I agree with so much of what you are saying. Donor States, of course, have given so much in the years past. We have helped to fund other programs throughout the United States, and yet we are being penalized, to a degree, because at one time we used to be one of the economic powerhouses, but we aren't today. Things have changed because industries have moved.

Now we are in need and we are looking out and saying, "Hey, come on back and help us. The cash has to start coming back."

Donor States, as Representative Pease has said, have given $32 billion more than they have received since 1982, which is an absolutely astounding figure.

Now, I know that they were talking about the fact that one of the priorities is not the increase in the minimum allocation; however, I intend, at some point, to offer an amendment to increase the minimum allocation from 85 to 90 percent.

As a matter of fact, as far as I am concerned I think it ought to be 110 percent, which it is my understanding the Pennsylvania receives perhaps as much as 110 percent. I don't see that there is any difference there when I take a look at the roads and the infrastructure needs.

But I think that a revision of the formula based upon needs would prove this out, and I think that the monies would come back to those areas which really need the bucks. We really need them.

You know, when industries are moving into an area, of course they look at a good tax base, they look at the education facilities, they look at attitudes of the people, but they also look at a good transportation system, and if you ain't got it they ain't coming. That is just exactly the way it is.

So Ohio has to be prepared. We have lost it, and now we are looking to have an equal opportunity to get it back. We have lost a great deal. And we can't get it and we are not going to be helped as far as the infrastructure needs—the reparation, the relocation, and the whole thing—if we are going to be looking at what Dan Rostenkowski has suggested as to lower the Federal deficit at $0.25 per gallon. That is ridiculous. I mean, if we use that to lower the defi-

cit, we are done. We are not going to be able to pass any more gas taxes in order to be able to help existing systems if we are going to use it to lower the Federal deficit.

Particularly, if Mr. Skinner is going to be successful—God help us if he is—but if, in the event that he is and he wants to push all of the responsibilities back onto the local areas so that the local areas then can raise their State taxes, and if we have a $0.25 on a national level, we are done. So we are not going to see anything. You can throw the whole thing out the window.

I think these are all very important and valid points. I think, also, that we are going to have to take a very serious look at taking the trust fund off of budget. As long as it is on budget we are in serious trouble, and we need to do that.

I think Ohio and some of the other—and let me say this: it isn't just Ohio. We are talking about Ohio, but if you take a look at some of the deficiencies that we have here with California and Texas where I see the total number of deficient bridges—55 percent of all the deficient bridges are in the minimum allocation States, but Texas has over 15 percent of the deficient bridges, and California is right up there. They have got about 6 percent, which is about equal to what Ohio has. This is a tremendous number.

Of course, in Ohio we have more because we have more bridges than any other State with the exception of one other State, which means that we have got a lot of them in there.

California and Texas really get hurt, too. Also, in the deficient interstate mileage Texas and California are right in there with Ohio. So we are talking—and let me say this, too, just to back our support up in what we need: 55 percent of the Members represent the 19 donor States. So we have got a lot of power and we should exercise that authority and make it work.

I just want to say that we have a lot of work to do here. We want to create the equity that is necessary, and we can do it with a revision of the formula, and we can do it with an increase in the minimum allocation to the donor States.

I thank you again for coming and making our case known. Thank you.

Mr. MINETA. Let me thank the panel very, very much for the presentation.

Earlier last year Congressman Applegate had us in Cambridge, Ohio. I had the opportunity to fly into Columbus and then to drive 60-some miles with our fine colleague and Mr. McEwen to Cambridge. Frankly, I was really surprised by the state of disrepair of I-70 in that stretch. So I can understand very much the kinds of concerns you are bringing to us today. I appreciate Mr. DeWine and Ms. Oakar and Mr. Pease and Mr. Stokes and the statements of your other colleagues from Ohio and the concerns that you bring to us.

Ms. OAKAR. Mr. Chairman.

Mr. MINETA. Ms. Oakar.

Ms. OAKAR. You didn't mention that you had come to Cleveland, although you have been there and we loved having you. Do you know that, as an example, our steel mill and industrial base is in the flats in Cleveland? Do you know the people couldn't get to work because several bridges were out for years? They had to do

all kinds of things to get workers to their jobs. This is what we are talking about with the industrial outlet of America not having access, let alone the rural areas. It is that critical. It really is.

I thank the Chairman. Come to Cleveland and you will really get an eyefull.

Thanks a lot.

Mr. MINETA. Very well. Thank you very much.

[Mr. Stokes' prepared statement follows:]

TESTIMONY OF

THE HONORABLE LOUIS STOKES

BEFORE THE PUBLIC WORKS AND TRANSPORTATION

SUBCOMMITTEE ON SURFACE TRANSPORTATION

MARCH 13, 1990

INTRODUCTORY STATEMENT

CHAIRMAN MINETA AND DISTINGUISHED MEMBERS OF THE SURFACE TRANSPORTATION SUBCOMMITTEE, ON BEHALF OF THE OHIO DELEGATION, I WOULD LIKE TO THANK YOU FOR GIVING US THE PRIVILEGE OF APPEARING BEFORE YOU TODAY. THE SUBJECT THAT WE WILL BE DISCUSSING TODAY -- REAUTHORIZATION OF THE HIGHWAY SURFACE ACT -- IS ONE OF THE MOST SERIOUS ISSUES FACING MY STATE, AND ONE OF THE MOST SERIOUS ISSUES FACING THIS NATION.

I WOULD LIKE TO START BY CONGRATULATING YOU, MR. MINETA, ON YOUR NEW POST AS CHAIRMAN OF THE SUBCOMMITTEE. MY THREE FELLOW OHIOANS ON YOUR PANEL HAVE EXPRESSED THEIR ADMIRATION FOR ALL YOUR GOOD WORK ON THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE.

THE MEMBERS OF THE OHIO DELEGATION HAVE ATTEMPTED TO COORDINATE OUR STATEMENTS SO THAT THE POSITIONS WE PRESENT TO YOU ARE

CONSISTENT, UNIFIED, AND COMPREHENSIVE. WE HAVE UNDERTAKEN AN EFFORT OF MANY WEEKS TO COORDINATE OUR STATEMENTS WITH THE VIEWS HELD BY OUR LOCAL ELECTED OFFICIALS AND THE OHIO DEPARTMENT OF TRANSPORTATION. WE HAVE ALSO WORKED EXTENSIVELY WITH OUR GOVERNOR, RICHARD CELESTE, WHO IS SLATED TO APPEAR BEFORE YOU NEXT WEEK.

OUR STATEMENTS ARE INTENDED TO BE CONSIDERED IN BLOC. ALTHOUGH EACH STATEMENT ADDRESSES A SOMEWHAT DIFFERENT ASPECT OF TRANSPORTATION, THERE IS AGREEMENT ON OUR BASIC RECOMMENDATIONS.

FOR THOSE OF US WHO COULD NOT APPEAR IN PERSON BECAUSE OF CONFLICTING SCHEDULES, I REQUEST THAT THEIR WRITTEN STATEMENTS BE INCLUDED IN THE COMMITTEE RECORD AS IF READ.

WE TRUST THAT YOU WILL FIND OUR POSITION WORTHY OF CONSIDERATION, BASED ON ITS MERIT -- NOT ONLY FOR OHIO -- BUT FOR

MANY OTHER STATES, AND THE NATION AS A WHOLE. WE LOOK FORWARD TO WORKING WITH YOU THROUGHOUT THE MANY MONTHS IT TAKES TO ENACT SURFACE TRANSPORTATION LEGISLATION.

[Ms. Oakar's prepared statement follows:]

TESTIMONY OF

THE HONORABLE MARY ROSE OAKAR

TO THE SURFACE TRANSPORTATION SUBCOMMITTEE

MARCH 13, 1990

TESTIMONY OF
THE HONORABLE MARY ROSE OAKAR
March 13, 1990

MR. CHAIRMAN:

THANK YOU FOR THE OPPORTUNITY TO TESTIFY BEFORE YOU TODAY CONCERNING THE ISSUES OF EQUITY IN TRANSPORTATION FUNDING AND THE NEED FOR EXPANDING THE FEDERAL INVESTMENT IN BRIDGES.

AS I HAVE SAID ON MANY OCCASIONS, INCLUDING TESTIMONY BEFORE THIS SUBCOMMITTEE, OUR NATION'S ECONOMIC FUTURE IS DIRECTLY LINKED TO THE SOUNDNESS OF OUR TRANSPORTATION STRUCTURES. ALLOW ME TODAY TO FOCUS ON TWO ISSUES IN THIS REGARD;

1. INEQUITIES IN THE DISTRIBUTION OF TRANSPORTATION FUNDING AND;

2. THE STATE OF OUR NATION'S BRIDGES.

CONGRESS TOOK DECISIVE ACTION ON BOTH ISSUES IN 1982, WHEN WE PASSED THE SURFACE TRANSPORTATION ASSISTANCE ACT, MORE THAN DOUBLING THE GASOLINE TAX -- HENCE MAKING TWICE AS MANY RESOURCES AVAILABLE FOR TRANSPORTATION -- AND BY INCLUDING THE "MINIMUM ALLOCATION" (MA) PROVISION THAT GUARANTEES EACH STATE AT LEAST 85 PERCENT RETURN ON ITS FEDERAL HIGHWAY INVESTMENT. I AM PROUD TO HAVE WORKED WITH CHAIRMAN JIM HOWARD TO CRAFT THIS INNOVATIVE PROVISION THAT HAS MADE SUCH A POSITIVE DIFFERENCE IN OHIO AND OTHER STATES AFFECTED BY HIGHWAY DISTRIBUTION FORMULA INEQUITIES.

AS WE CONSIDER THE REAUTHORIZATION OF OUR NATION'S HIGHWAY PROGRAM, I WOULD ENCOURAGE THE SUBCOMMITTEE TO STUDY THE HIGH CORRELATION BETWEEN THE VOLUME OF TRANSPORTATION REPAIR NEEDS AND A STATE'S DONOR STATE STATUS WITH RESPECT TO THE HIGHWAY TRUST FUND AND OTHER FEDERAL PROGRAMS. YOU WILL FIND THAT MANY OLDER INDUSTRIAL STATES LIKE OHIO CONTINUE TO FALL INTO THE DONOR STATE CATEGORY, PERPETUATING GENERATION-OLD DISTRIBUTION FORMULAS THAT MAY NO LONGER SERVE THE BEST INTERESTS OF THE STATE OR THE COUNTRY. IF OUR NATION IS TO CONTINUE TO REMAIN COMPETITIVE, WE MUST INVEST OUR TRANSPORTATION RESOURCES WHERE THEY ARE SO DESPERATELY NEEDED -- AREAS THAT HAVE HISTORICALLY CONTRIBUTED MUCH MORE THAN THEY RECEIVED.

ACCORDING TO FHWA, 23% OF THE NATIONS'S BRIDGES WERE "STRUCTURALLY DEFICIENT" IN 1986; 19% WERE CONSIDERED "FUNCTIONALLY OBSOLETE". FHWA ESTIMATES THAT MORE THAN $50 BILLION IS NEEDED TO REPAIR, REHABILITATE, AND WHERE NECESSARY, REPLACE BRIDGES ACROSS THE NATION. MORE RECENT ANALYSIS INDICATE THIS $50 BILLION ESTIMATE MAY BE TOO LOW.

BASED ON THE INELIGIBILITY OF BRIDGES IN DONOR STATES FOR DISCRETIONARY FUNDING, MANY OF THE U.S. BRIDGE STRUCTURES MOST IN NEED OF REPAIR ARE NOT LIKELY TO BE FIXED WITHIN THIS DECADE.

THIS IS A PROBLEM OF NATIONAL CONCERN GIVEN THAT 55% OF THE NATION'S DEFICIENT BRIDGES ARE IN STATES RECEIVING THE LEAST FEDERAL FUNDING FOR BRIDGE REPAIR, BASED ON THEIR CONTRIBUTIONS,

AND WHICH HAVE TO SPREAD LIMITED STATE AND LOCAL RESOURCES THE FARTHEST.

FURTHER, I WOULD REQUEST THAT THE ATTACHED LIST OF TEN OHIO BRIDGES BE ADDED TO THE COMMITTEE'S LIST OF STRUCTURES ELIGIBLE FOR BR DISCRETIONARY FINANCING. ASSUMING THAT THE PENALTY FOR DISCRETIONARY FUNDING FOR DONOR STATES IS CORRECTED IN THE NEXT REAUTHORIZATION BILL, THESE STRUCTURES MEET THE CRITERIA FOR ADDITION TO THE BR DISCRETIONARY LIST. THESE BRIDGE PROJECTS HAVE BEEN IDENTIFIED THROUGH THE COOPERATIVE FEDERAL PROCESS CALLED FOR BY 23 U.S.C. 134, AND ARE SUPPORTED BY LOCAL AND STATE ELECTED OFFICIALS AND THE OHIO DEPARTMENT OF TRANSPORTATION. ALL PROJECTS ON THIS LIST ARE SUPPORTED BY ALL THE MEMBERS OF THE OHIO DELEGATION APPEARING HERE TODAY, AND BY GOVERNOR CELESTE.

UNFORTUNATELY, THE BRIDGE PROBLEM IN OHIO FAR EXCEEDS WHAT CAN BE REASONABLY SOLVED BY AVAILABLE FUNDS, EVEN WHEN BR DISCRETIONARY FUNDS ARE MADE AVAILABLE WITHOUT PENALTY. IN MY OWN FIVE-COUNTY REGION OF NORTHEAST OHIO, A THOROUGH ANALYSIS OF THE COMPLETE BRIDGE INSPECTION RECORDS HAS BEEN COMPLETED. THIS REPORT IS SUBMITTED FOR THE COMMITTEE RECORD. REPORT???

THIS ANALYSIS CONFIRMS THAT IN NORTHEAST OHIO:

- 1 BRIDGE IN EVERY 10 IS "STRUCTURALLY DEFICIENT";

- 1 BRIDGE IN 3 IS MORE THAN 50 YEARS OLD, AND 1 IN 10

IS MORE THAN 90 YEARS OLD;

- 1 BRIDGE IN 5 SHOULD BE REPLACED;

- $1.66 BILLION MUST BE SPENT TO REPAIR, REHABILITATE, OR REPLACE BRIDGES IN THE FIVE-COUNTY GREATER CLEVELAND AREA;

- URBAN SYSTEM BRIDGES ACCOUNT FOR ABOUT 20% OF THE BRIDGES ON THE OVERALL SYSTEM, BUT CONSTITUTE MORE THAN 36% OF OUR DEFICIENT BRIDGES.

IN RESPONSE TO THESE NEEDS, THE NORTHEAST OHIO AREA WILL SPEND MORE THAN 41% OF ALL ITS AVAILABLE FEDERAL AID OVER THE NEXT FIVE YEARS ON BRIDGES. WE HAVE SEVERAL STRUCTURES WHICH WILL COST IN EXCESS OF $50 MILLION TO RESTORE.

IN VIEW OF THE SIZE OF OUR BRIDGE NEEDS, AND THE EXTENT TO WHICH STATE AND LOCAL FUNDS ARE ALREADY BEING DIRECTED TO BRING THE MOST HEAVILY TRAVELED AND DEFICIENT STRUCTURES UP TO STANDARD, IT IS INCONCEIVABLE THAT THE ADMINISTRATION IS PROPOSING THAT THE FEDERAL FUNDING RATIO BE DECREASED.

DESPITE SIGNIFICANT INCREASES IN GASOLINE TAXES, LICENSE PLATE FEES, AND A BOND ISSUE, CITIES LIKE CLEVELAND, CINCINNATI, TOLEDO, AKRON, YOUNGSTOWN, DAYTON, CANTON, AND COLUMBUS HAVE A

VERY DIFFICULT TIME MATCHING FEDERAL FUNDS. IF FEDERAL MATCH REQUIREMENTS FOR HIGHWAYS AND BRIDGES ARE INCREASED, MANY U.S. CITIES WILL FACE A CRISIS IN TRANSPORTATION.

THE FEDERAL TRANSPORTATION PROGRAM WILL BECOME A DE FACTO DISENFRANCHISING OF THE NATION'S METROPOLITAN AREAS. AREAS WITH THE SEVEREST FINANCIAL PROBLEMS SIMPLY WILL NOT BE ABLE TO AFFORD FEDERAL TRANSPORTATION AID.

SUCH A POLICY WOULD HAVE DEVASTATING EFFECTS ON CITIES ALL OVER THIS NATION. I CAN UNDERSTAND WHY BUDGET CONCERNS MIGHT TEMPT THE ADMINISTRATION TO CONSIDER INCREASING THE MATCH REQUIREMENTS FOR HIGHWAY AND BRIDGE PROJECTS. UNFORTUNATELY, THE FACT REMAINS THAT IT IS OLDER, POORER CITIES THAT HAVE THE OLDEST BRIDGES AND THE LEAST MONEY TO FIX THEM.

I AM CERTAIN THAT WHEN STUDIES SIMILAR TO THAT UNDERTAKEN FOR NORTHEAST OHIO ARE CONDUCTED IN OTHER METROPOLITAN AREAS, THE RESULTS WILL BE SIMILARLY OVERWHELMING.

THE NATIONAL BRIDGE PROBLEM EXTENDS BEYOND URBAN AREAS INTO THE RURAL AREAS. IF FEDERAL AID IS LIMITED TO ONLY THOSE BRIDGES ON THE INTERSTATE SYSTEM -- OR ON A "SYSTEM OF NATIONAL SIGNIFICANCE" -- MOST OF THE DEFICIENT BRIDGES IN THE U.S. MAY NOT BE ELIGIBLE FOR FEDERAL AID.

IN NORTHEAST OHIO, 36% OF ALL "STRUCTURALLY DEFICIENT"

BRIDGES ARE NOT ON THE INTERSTATE SYSTEM, NOR ARE THEY LIKELY TO BE INCLUDED IN A "SYSTEM OF NATIONAL SIGNIFICANCE". YET THESE BRIDGES CARRY TENS OF THOUSANDS OF VEHICLES EACH DAY. THEY ARE AMONG THE OLDEST, MOST HEAVILY TRAVELED, AND LEAST SAFE STRUCTURES.

MANY OF THE BRIDGES ON THE INTERSTATE SYSTEM ARE NOW REACHING THE END OF THEIR USEFUL LIFE. THIS IS PARTICULARLY TRUE IN STATES WHICH TOOK THE INITIATIVE AND BUILT THEIR INTERSTATE ROUTES IN THE 1950'S. THESE STATES HAVE INTERSTATE BRIDGES WHICH ARE 30 TO 40 YEARS OLD. WITH HEAVIER TRUCKS, AND INCREASED COMMERCIAL TRAFFIC, THE SAFETY OF MANY OF THESE INTERSTATE BRIDGES IS IN JEOPARDY.

IN THE PAST, THE NATION'S ATTENTION HAS BEEN DIRECTED TO THE BRIDGE PROBLEM ONLY AFTER A CATASTROPHIC BRIDGE FAILURE RESULTS IN LOSS OF LIFE. RECENT FAILURES IN NEW YORK AND TENNESSEE, AND MOST RECENTLY THE TRAGIC COLLAPSE OF INTERSTATE 880 IN OAKLAND, CALIFORNIA, ARE THE MOST VISIBLE AND MEMORABLE REMINDERS THAT TIME IS RUNNING OUT FOR MANY U.S. BRIDGES.

FOR THESE REASONS, IT IS IMPERATIVE THAT THE NEXT SURFACE TRANSPORTATION ACT PRESERVE AND ENHANCE SPECIFIC FUNDING FOR BRIDGE REHABILITATION AND REPLACEMENT. WE MUST ALSO ENSURE THAT PREVENTIVE MAINTENANCE PROGRAMS ARE IN PLACE AND ENFORCED AS A CONDITION OF RECEIPT OF FEDERAL AID. THIS CAN BE ACCOMPLISHED ONLY BY APPLYING THE EXPERTISE AVAILABLE IN STATE DEPARTMENTS OF

TRANSPORTATION AND AT FHWA IN A STREAMLINED PROGRAM THAT ELIMINATES BUREAUCRATIC HINDRANCES AND UNNECESSARY DELAY.

FINALLY, THE U.S. DEPARTMENT OF TRANSPORTATION AND STATE TRANSPORTATION DEPARTMENTS MUST FIND WAYS TO HASTEN BRIDGE PROJECTS AND SPEED THE REVIEW OF BRIDGE REPAIR DESIGN PLANS. THE FEDERAL ROLE SHOULD NOT ONLY BE ONE OF REVIEWER AND REGULATOR, BUT ALSO ONE OF EXPEDITOR AND PROVIDER OF TECHNICAL ASSISTANCE. THIS RECOMMENDATION IS SUPPORTED BY THE PRIVATE SECTOR IN NORTHEAST OHIO, WHICH IS INVESTING ITS OWN RESOURCES IN HELP TO DEVELOP A FAST TRACK PROJECT REVIEW SYSTEM.

ALTHOUGH ANY SUBSTANTIVE INCREASE IN BRIDGE INSPECTION AND REPAIR DESIGN REVIEW WILL BE COSTLY, IT IS ESSENTIAL. LIVES ARE AT STAKE ON AMERICA'S BRIDGES.

AND OUR ECONOMIC LIFE MAY ALSO BE AT STAKE. WHEN A BRIDGE IS CLOSED, OR LOAD LIMITS IMPOSED, COMMERCIAL TRAFFIC MUST BE REROUTED AT GREAT EXPENSE. WITH TRANSPORTATION COSTS ACCOUNTING FOR 25% OF THE COST OF GOODS WE EXPORT, YOU CAN SEE THE URGENT NEED TO KEEP U.S. BRIDGES OPERATING EFFICIENTLY.

IN CLOSING, LET ME RECOMMEND THAT THE COMMITTEE CONSIDER ESTABLISHING A SEPARATE CATEGORICAL PROGRAM FOR BRIDGE REPAIR, REHABILITATION, AND REPLACEMENT. THE ENORMITY OF THE NATION'S BRIDGE PROBLEM, AND THE RISK INHERENT IN DELAYING URGENT BRIDGE REPAIRS, LEAD ME TO BELIEVE THAT A SEPARATE PROGRAM MAY BE APPROPRIATE.

THANK YOU.

DISCRETIONARY BRIDGE CANDIDATE LIST
AS ASSEMBLED BY OHIO'S
METROPOLITAN PLANNING ORGANIZATIONS
FEBRUARY, 1990

Akron

Name: North Main Street (High Level Bridge)
Crosses: Cuyahoga River
Location: Akron
System: FAUS
Work: Rehabilitation
Status: Under design; alternative rehabilitation options are being evaluated; programmed for 1991 construction.
Est'd Cost: Low to mid $9 million range
Project ID: P.I.D. 6958

Cincinnati

Name: 3rd Street Viaduct
Crosses: IR-471, Eggleston Avenue and Valley
Location: Cincinnati
System: Primary - US-50
Work: Replacement
Status: Pre-design; construction for approximately 1994-95.
Est'd Cost: $10 million
Project ID: N/A

Name: Ludlow Viaduct
Crosses: IR-75, CSX RR and NS RR, and Mill Creek
Location: Cincinnati
System: Primary over Interstate - US-127
Work: Replacement
Status: Under design; construction expected in 1991.
Est'd Cost: $10.025 million (Federal share is currently programmed with $5.64 million in "BR" and $2.115 million with "IR" funds)
Project ID: P.I.D. 4859 (Ham - US-127 - 5.19)

Cleveland/Lorain-Elyria

Name: Eagle Avenue Lift Bridge
Crosses: Cuyahoga River
Location: Cleveland
System: FAUS
Work: Replacement
Status: Alternative Analysis about to begin; construction expected after 1995.
Est'd Cost: $50 million
Project ID: P.I.D. 5413

Name: Columbus Road Lift Bridge
Crosses: Cuyahoga River
Location: Cleveland
System: FAUS
Work: Major Rehabilitation and Reconstruction
Status: Preliminary Engineering; construction programmed for 1992.
Est'd Cost: $13.0 million
Project ID: P.I.D. 5383

Name: Veterans Memorial (Detroit-Superior) Bridge
Crosses: Cuyahoga River and industrial land
Location: Cleveland
System: Primary
Work: Major Rehabilitation
Status: Preliminary Engineering; construction expected by 1993.
Est'd Cost: $13.7 million
Project ID: P.I.D. 5561

Ironton-Huntington

Name: Ironton - Russell Bridge
Crosses: Ohio River
Location: Ironton, Ohio - Russell, Kentucky
System: Primary - SR-93 (Ohio)
Work: Replacement
Status: Pre-feasibility.
Est'd Cost: $25 million
Project ID: N/A

Toledo

Name: unnamed
Crosses: Maumee River
Location: Toledo
System: Interstate (possible)
Work: New Bridge (to augment IR-280 Draw Bridge)
Status: Consultant selected to study alternatives.
Est'd Cost: $100 million
Project ID: N/A

Youngstown

Name: Center Street Bridge
Crosses: Industrial land
Location: Youngstown
System: FAUS
Work: Replacement with new structure just east of current bridge
Status: Preliminary Engineering; construction expected by 1996.
Est'd Cost: $18.1 million (total project); $11. 0million (bridge portion)
Project ID: (Mah-CH-313 - 0.43)

Name:	unnamed
Crosses:	Meander Reservior
Location:	IR-80, 0.97 miles east of Ohio Turnpike (IR-76)
System:	Interstate
Work:	Replacement of two 120' bridges with a partial causeway and shorter structures
Status:	Preliminary Engineering; construction programmed for 1994.
Est'd Cost:	$11.1 million
Project ID:	(Mah-IR-80 - 0.97)

[Mr. Pease's prepared statement follows:]

STATEMENT OF THE HONORABLE DON J. PEASE
MEMBER OF THE UNITED STATES HOUSE OF REPRESENTATIVES

before the
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SURFACE TRANSPORTATION SUBCOMMITTEE
UNITED STATES HOUSE OF REPRESENTATIVES

concerning the
REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

March 13, 1990

Thank you for the opportunity to testify before you today concerning the extremely important subject of reauthorizing the federal transportation program.

I will focus my remarks on three topics. First, the issue of equity. Second, the importance of correcting disparities in federal transportation investment to keeping the U. S. competitive in world markets. And finally, the need for new highway capacity---especially in states which have received the lowest legal amount of federal highway aid based upon their user contributions to the Highway Trust Fund.

EQUITY

You will recall that, when the proposal to raise the federal gas tax was enacted in 1982, a number of us in the highway donor states---that is, states that have contributed far more in gas tax than we ever got back in highway apportionments---insisted that some guaranteed minimum return be incorporated into the legislation. Many legislators assume that, based on this guarantee, and the amendments passed in 1987, the donor states get close to a fair share of their gas tax dollars back. Although we certainly do better as a percentage than we did before Minimum Allocation was enacted, we still lose about as many dollars to the Highway Trust Fund as we ever did.

In fact, since 1982, the donor states have contributed more than $32 billion to the rest of the nation. As one of my local elected officials put it, "One of Ohio's major exports is cash."

Many legislators also assume that---if a state gets close to a dollar of federal highway funds back for each dollar it contributes---it is getting its "fair share". In fact, this is not entirely correct.

The "dollar out for dollar in" concept of what's "fair" fails to count the rights of all states, including donor states, to any of the billions of dollars in interest earned by the Highway Trust Fund.

In fact, since 1982, more than $9.1 billion in interest has been paid to the Highway Trust Fund by the U. S. Treasury. I am sorry to say that none of those dollars in interest payments went toward fixing highways or bridges in some of our biggest and most heavily traveled states - states such as Ohio, California, and Texas.

And none of these interest dollars were spent to fix highways in some of our poorest states, states such as Mississippi, Arkansas, and Oklahoma.

In fact, taxpayers in each of these states, and many others---North Carolina, South Carolina, Indiana, Missouri, Wisconsin, Arizona, and others---got back less than 85 percent of their gas tax and user fee contributions, let alone any of the interest accrued by the Highway Trust Fund.

At the time the Minimum Allocation guarantee was enacted, none of us foresaw that there would come a day when it would directly affect more than half of all Americans. Unfortunately, that day has come. As our use of gasoline and highways has escalated, highway obligation ceilings have been decreasing. As a result there are now 19 states in the Minimum Allocation program. This number is expected to increase unless changes are made in how federal highway funds are distributed.

At the time the Minimum Allocation program was enacted, none of us anticipated that this guarantee would act not as a floor, as was the intention, but as a ceiling on the amount of federal funds that could be allocated to any state.

The fact is that, today, more than half the deficient highways in this country, and more than half the deficient bridges in this country, are---for all practical purposes---locked out of federal discretionary funding.

Donor states remain legally constrained as to the amount of federal highway funds they can receive, even in an emergency. They have a guaranteed loss---rather than a guaranteed minimum return---on their federal gas tax and highway user fee payments.

Surely, this is not in the best interest of the nation as a whole. It certainly is not in the best interest of the safety of the American public.

And it has serious implications for the U. S. economy and our ability to compete in world markets.

Without question, factors and formulas used to distribute federal funding should be reexamined. Many are seriously out of date. I, and other Members of the Ohio Delegation, agree with the GAO, the National Association of State Highway and Transportation officials, and many recognized experts in highway safety and finance: Factors which reflect need, use, system extent, and condition should be incorporated into distribution formulas.

This would result in formulas which more accurately reflect both need for federal funding assistance and equity of return in a user fee financed program.

Short of that, and given the difficulty inherent in changing formulas when budgets are constrained by deficit problems, we are requesting that the Minimum Allocation program be increased from 85 percent to 90 percent, and that all states, including donor states, be allowed to accept discretionary funds without penalty.

Discretionary and emergency funding should never be included in the calculation of Minimum Allocations to each state. Only the formula apportionments should be the basis for Minimum Allocation.

As the program operates now, any donor state which is eligible for or is selected to receive discretionary funds must give up the equivalent number of dollars in MA funds. No state is likely to do this, nor is any Secretary of Transportation likely to offer discretionary funds to a state which would not gain any net benefit from the award.

Mr. Chairman, more than half the roads and bridges in this country most in need of repair are ineligible for discretionary assistance because of existing law! This makes no sense.

Discretionary funding programs were enacted to help fix those roads and bridges most in need of repair and which could not be fixed otherwise because insufficient funds were available. But under existing law, states with the smallest legal amount of federal assistance based upon their gas tax contributions are locked out of the very discretionary programs designed to help when money is short and repair needs are most urgent.

Elimination of the pay back penalty in current law, so that all states have equal access to, and consideration for, discretionary funds is

mandatory if we are to develop a bill which the majority of Americans agree is fair.

COMPETITIVENESS AND CAPACITY

Current law also leads to discrimination in funding for new highway capacity. Donor states are forced by low levels of federal assistance to apply a much higher proportionate share of their state and local funds to repair existing highways and bridges. Very little money remains to undertake planning, design, and construction of any new highway capacity.

Yet donor states experience most of the nation's worst traffic congestion and gridlock. California and Texas are prime examples of donor states with major gridlock and congestion problems.

The U. S. Department of Commerce projects a 30 percent increase in commercial highway traffic in the next decade. This increase in commercial traffic is concentrated in donor states, where over half the gross national product is generated. In particular, this increase in truck traffic will be felt in the donor states' metropolitan areas.

But it takes at least five to ten years to design and build even a modest new highway link, or add lanes to a major highway. That's longer than it took to win World War II.

If it takes up to ten years to build new capacity, and commercial traffic increases by 30 percent in the next ten years, we are facing a decade of gridlock. It may be already too late to plan or build our way out. And donor states which have much of the nation's congestion problems have the least federal, state, and local funds available to undertake new construction.

This has remarkable implications for U. S. productivity. Let me share with you some of the reasons why donor states must have greater federal highway aid, and why it is in the national interest to provide it.

U. S. DOT indicates that in 1985, vehicles on U. S. freeways racked up one-half billion hours in delays. This is expected to rise to 3.9 billion hours---an increase of almost eight-fold---in fifteen years if no improvements are made to deal with congestion.

Peak hour congestion increased from 54 percent of urban interstate miles in 1982 to 65 percent of urban interstate miles in 1987. Approximately 24 percent of urban major non-interstate routes are routinely congested now.

The Director of the Los Angeles County Transportation Commission testified in 1987 that the cost of congestion in Los Angeles County was about 485,000 hours per day of wasted time. That converts by their estimates, to a minimum of about $507 million per year in lost time, and about 72 million gallons of gasoline.

Unfortunately, this scenario is played out every weekday all across the nation. For every dollar of export goods produced in the U. S., about 25 cents is spent on transportation. Public and private sectors must cooperate to keep transportation costs as low as possible. Yet urban traffic congestion may force an increase in transportation costs which immediately makes U. S. goods less price competitive world wide.

This is a particular concern for donor states. More than half the export goods produced in this country are produced in donor states. Yet,

- it is this group of states which remains the victim of systematic federal disinvestment in infrastructure,
- it is this group of states which experiences much of the gridlock and congestion in the U. S., and
- it is these states which have the least money, based on their contributions, to overcome the problem.

These are just a few examples of the need to increase federal investment in highways in donor states, and why such action will improve U. S. competitiveness.

Thank you.

Mr. MINETA. Let me call forward a fine panel made up of officials of the American Association of State Highway and Transportation Officials, known commonly as AASHTO: Kermit H. Justice, Secretary, Delaware Department of Transportation and President of AASHTO; Hal Rives, Commissioner, Georgia Department of Transportation and Vice President of AASHTO; Charles L. Miller, Director, Arizona Department of Transportation and Chairman of the Task Force on a Consensus Transportation Program of AASHTO; Robert K. Best, Director of the California Department of Transportation; and Richard J. Backes, Commissioner/Director of the North Dakota Department of Transportation. They are accompanied by their TV star, Francis B. Francois, the Executive Director of AASHTO.

Mr. President, we are pleased to have you here. If you would go ahead and proceed in your own fashion, your statements will all be made a part of the record.

TESTIMONY OF A PANEL CONSISTING OF KERMIT H. JUSTICE, SECRETARY, DELAWARE DEPARTMENT OF TRANSPORTATION AND PRESIDENT OF THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS [AASHTO], ACCOMPANIED BY HAL RIVES, COMMISSIONER, GEORGIA DEPARTMENT OF TRANSPORTATION AND VICE PRESIDENT, AASHTO; CHARLES L. MILLER, DIRECTOR, ARIZONA DEPARTMENT OF TRANSPORTATION AND CHAIRMAN OF THE TASK FORCE ON A CONSENSUS TRANSPORTATION PROGRAM OF AASHTO; ROBERT K. BEST, DIRECTOR OF THE CALIFORNIA DEPARTMENT OF TRANSPORTATION; RICHARD J. BACKES, COMMISSIONER/DIRECTOR OF THE NORTH DAKOTA DEPARTMENT OF TRANSPORTATION; AND FRANCIS B. FRANCOIS, EXECUTIVE DIRECTOR, AASHTO

Mr. JUSTICE. Thank you very much, Mr. Chairman. I sincerely appreciate this opportunity and you, sir, in your leadership in the world of transportation. And to you, Mr. Shuster, we sincerely appreciate your efforts and longstanding. And to the other members of the committee, we likewise commend you for all your efforts on behalf of transportation.

Mr. Chairman, for the record, I am Kermit H. Justice, President of AASHTO and Secretary of the Transportation Department of Delaware.

Let me again commend you and the subcommittee for establishing this set of hearings and beginning the process leading to a new Federal Surface Transportation Act.

Mr. Chairman, I have submitted my written testimony to you, and I request that it be accepted for the record, as you indicated you will. With your permission I would now like to offer a brief oral summary of my testimony.

Before I begin I guess I ought to introduce a few of the players here and apologize for the absence of some of our players who we hope will still join us.

With us is the Executive Director of our organization, whom I know you know well, Mr. Frank Francois.

We also have with us the Commissioner of Transportation from the State of North Dakota, Dick Backes, who will be speaking in behalf of a loosely-organized portion of our organization known as the Bread Basket Coalition, as well as a strong supporter of AASHTO in its efforts.

We also have with us the Director of Transportation for the State of California, who will be speaking for another group of wide-ranging—demographically and geographically—and interested members of our organization known as the Crescent Coalition, Mr. Bob Best from the State of California, also a strong supporter of AASHTO's efforts.

And the gentlemen to my right is the gentleman who served as the task force chairman for the Transportation 2020 effort that AASHTO put forth and you have copies of. Charlie Miller, who is the Director of Transportation for the State of Arizona, deserves a lot of credit for chairing that committee. They had a long task of almost three years in putting its work together.

And our Vice President, Mr. Hal Rives, is not yet with us. He has other needs within the complex today. I hope he will join us as soon as he possibly can. In any case, I would hope that his testimony would be made part of the record if he does not make it with us.

Mr. Chairman, you in your committee, and we as State transportation officials, have a once in a generation opportunity to set the course for America's transportation for decades to come. The kind of surface transportation system we provide to take America into the next century will make or break this nation's economy and will directly affect the lifestyle and the quality of life of all Americans

What kind of system should it be? AASHTO believes we must include both highways and public transportation since, in much of our nation, both modes are necessary to assure mobility as we move into the 1990s.

What are AASHTO's transportation goals for the new surface transportation bill? We have identified seven: preservation of the highway and public transportation systems we have already created, which, alone, will require substantial investments by all levels of government; congestion relief for our choked urban and suburban areas using a mix of highway and transit solutions; adequate funding based upon user and benefiter fees, with general funds continued for public transportation; a renewed national commitment to safety through research and new programs and applications; access to all the regions of this nation through a balanced, coordinated system; planning and research to develop new transportation technologies and apply them promptly; and economic growth and vitality through improved productivity, reduced costs, and improved international competitiveness.

For America's highways we must provide for system maintenance, bridge needs, interstate reconstruction, urban congestion relief, principal arterials to better serve the nation, and increased interstate capacity—and, of course, completion of the remaining interstate highway and interstate substitution projects is a top priority.

In transit we must improve public transit services to address urban congestion, enable the reconstruction and maintenance of our facilities, and provide mobility for the non-driving public.

Structurally, AASHTO believes that the highway and public transportation programs should each have two basic components. The first component is a categorical program, focused on meeting national transportation goals for highways. This should include a system of highways of national significance, including the interstate system and additional mileage selected from our principal arterials to form a new national highway system.

The second basic component is a flexible State and local program focused on specific national goals identified by Congress. Our State and local governments would be charged with annually preparing a plan to meet those goals, and Federal oversight would be maintained by approval of the annual plan and through annual progress reports. This program will provide the flexibility needed to address the unique needs found in communities across the nation, while assuming that Federal funds are spent to solve national issues identified by Congress. We believe that gives Congress full control, as it wishes.

What should be the Federal investment level? For highways, AASHTO recommends a Federal funding level of $17.6 billion in fiscal year 1992 increasing in increments to $25.9 billion in fiscal year 1995.

For public transportation we recommend a Federal capital funding level of $3.5 billion for fiscal year 1992, increasing to $5 billion in fiscal year 1995, accompanied by a continuation of operating assistance at the current level of about $800 million annually.

While on the subject of funding Mr. Chairman, let me address an issue raised by the Administration's national transportation policy.

While we applaud this initiative by President Bush and Secretary Skinner for the attention it has focused on the nation's transportation system, and while we agree with much of what is proposed, one specific area causes us grave concern. The proposal to shift a larger share of transportation financing responsibilities to the State and local governments.

AASHTO believes that all levels of government, not just State and local governments, need to accept part of the transportation funding responsibility. I want to repeat that. AASHTO believes that all levels of government, not just State and local governments, need to accept part of the transportation funding responsibility.

There is a clear Federal interest in assuring that the United States has a sound transportation system, and we think the Federal Government must continue to accept, at least its current percentage, share of our overall transportation costs. State and local governments are already sharing the lion's share of America's road costs—collectively over 75 percent.

The last increase in Federal fuel taxes was in 1982. Since 1982, State legislatures have approved a total of 92 State gas tax increases. One State has increased its gas tax four times, another eleven States three times, and nineteen States have had two gas tax increases. The average State gasoline tax has doubled from $0.08 in 1980 to over $0.16 per gallon in 1990. Clearly the States have been meeting their fair share of road funding. We think the Federal Government should also.

I might add that the gas tax only represents a portion of what the States put up. There are a lot of other taxes levied for transportation purposes.

With respect to AASHTO's recommended funding levels, Mr. Chairman, using the balance in the Highway Trust Fund, coupled with repeal of the gasohol tax exemption, should fund at least the first two years of our program without any Federal tax increase.

Mr. Chairman, my colleagues will address other issues of concern to the States, and then we would be pleased to answer any questions you may have.

In closing, Mr. Chairman and members of the subcommittee, AASHTO stands ready to assist you as you address the future of the nation's surface transportation system. We again commend you for calling these hearings and look forward to working with you to a conclusion.

Thank you, Sir.

Mr. Chairman, with your permission I would like to defer to Mr. Miller and hold the option open for Mr. Rives if he does join us.

Mr. MINETA. Absolutely.

Mr. MILLER. Thank you, Mr. Chairman and members of the committee.

I am Charles Miller, Director of the Arizona Department of Transportation. It was also my pleasure to have served as the chairman of the AASHTO Task Force on the Development of a Consensus Transportation Program, which we kind of evolved into a short title, Transportation 2020.

As one of the parts of AASHTO's testimony this afternoon, I would like to cover three basic topics: first, the composition of our task force and how we functioned since 1987; second, to review our consensus-building efforts that were organized by AASHTO; and, third, to provide a little bit of background information on the highway program recommendation of AASHTO.

As I think you know, the AASHTO policy committee agreed to form a task force in 1987 to work on a consensus transportation program. We began that work with the efforts toward highway programs and public transit. In 1988 we expanded our efforts to include rail, water, and aviation. And then later, in 1989, we expanded once again to include in our effort and our work products transportation research and technology transfer.

The task force was created by a broad representation from four regions of AASHTO, and included large, medium, and small States.

The overall concept of our task force's effort centered around three basic activities: one, was the gathering of information and data and the analysis of that data; second, to develop a set of alternatives from which we could choose recommendations; third, to try to build a consensus. We believe that AASHTO's effort has been the most comprehensive ever undertaken by our member departments in that regard.

In order to build consensus, AASHTO initiated two major activities. One was the creation of an Advisory Committee on Highway Policy very early on in our process. That particular activity was chaired by Lester Lamm of the Highway Users' Federation and ultimately involved over 100 public and private sector organizations in its work. That organization, together with our member depart-

ments, was responsible for carrying out some 65 forums held nationwide. They resulted in the publication of a report entitled "Beyond Gridlock." That report has been submitted to this committee.

In addition, they have recently completed their work in the publication of a report entitled, "Is Consensus Possible?" That report is being submitted, as well.

The second major effort of AASHTO in consensus building was the development of a group known as the Transportation Alternatives Group, which brought together some 12 separate organizations that are concerned about national transportation. AASHTO was a part of that organization.

Entitled TAG for short, the Transportation Alternatives Group published its alternative report entitled, "Future Federal Surface Transportation Program Policy Recommendations." Copies of that report have been provided to your committee.

Mr. Chairman, an examination of the TAG and Advisory Committee on Highway Policy final reports, as well as ours, indicates a significant consensus has been achieved on a number of key issues that are before and will be before this committee.

During the 65 public forums that were held by the AASHTO member departments and the Advisory Committee on Highway Policy there were two major themes that we heard. First and foremost was that there must be a national highway system. Secondly, that a greater flexibility would be needed in dealing with all of the other surface transportation issues and problems—a flexibility that would allow States and local governments to tailor solutions to their specific problems. We are not talking about block grants; rather, AASHTO believes that the use of Federal dollars on our highway system should serve broad Federal and national goals which the traditional block grant approach will not assure.

Our solution was to craft what we called the flexible and local highway program set forth in our report which we have submitted to you. Additionally, we also spoke briefly to the issue of our categorical highway program recommendation based around a highway system of national significance. Simply put in its description, we need a larger national highway system than the current interstate system.

We believe that with the completion of the interstate highway system rapidly approaching, the focus on the next highway bill should be on a system larger than the existing interstate system, but small enough to assure that the national objectives can be achieved. It is from this belief that our so-called "highway system of national significance" has emerged.

Mr. Chairman and members of the committee, this concludes AASHTO's three-part presentation. We will hold open the possibility that Mr. Rives will arrive and provide our final part.

We again commend you for beginning the process of leading the way to a new surface transportation bill and we offer our assistance wherever possible.

Thank you very much.

[The reports referred to by Mr. Miller were received for the record and are retained in the subcommittee file.]

Mr. MINETA. Thank you very much.

Mr. JUSTICE. Mr. Chairman, I guess I would offer that Director Best, with your concurrence, would be next.

Mr. MINETA. Very well.

Welcome to the committee, Mr. Best.

Mr. BEST. Mr. Chairman, it is a pleasure to be here. I represent today not only the State of California, but a group of States that has been referred to as the Crescent Coalition, which is a diverse group of States of different sizes, different geographic circumstances, and different local needs that tried to come together and work out a consistent formula that would serve a representative sample of States across the country.

I think what we have tried to do with States is to assist the committee by working through the AASHTO organization to identify and attempt to adopt a broad set of policies and principals that virtually all of the States could sign on to and support to give the committee a pretty clear idea of where the States, as a whole, were thinking.

We then, in effect, have a tier in that we have the Crescent Coalition and the Bread Basket Coalition, which are more precise and have recommendations that build off of the AASHTO presentation. And then, of course, individual States will have individual problems as time goes along.

I think it is clear that we see a lot of consensus generating on the broad principles. A number of the recommendations that AASHTO has made were reflected in the Secretary's presentation and principles. The five principles that the chairman has announced and has spoken to several times also are supported by the AASHTO recommendations. And so a lot of what is happening has already identified a high degree of consensus by principal players in this field.

What I would like to do is not go over the written testimony or the written statement for the coalition but highlight a few key points that I think are of concern to everybody.

First of all is the question of flexibility. As Mr. Miller stated, the concept of flexibility the States are advocating is not a traditional block grant program. It is not a turn-back program. We don't believe that in the transportation programs that the Federal Government should lose track of its role, its priorities, and its responsibilities.

As Mr. Bosco said a little bit earlier, it is important that the interest and concerns viewed from a national level are recognized, including the local problems as viewed from a national level. And so the flexible program concept that is being advocated is an extension of the combined road plan that has been in effect for a number of years. Now to allow greater flexibility in the use of dollars to mold the use of the Federal program to the particular needs of a given State.

We just don't have 50 States with 50 identical problems. So we need flexibility in those Federal programs so that where you have a higher priority need in one State and a lower priority elsewhere, you can adapt the Federal program to serve the Federal priorities in the greatest need area within that particular State. That is the concept that goes behind the flexible program, not a block or a turn-back kind of program.

It would be guided by Federal priorities, addressed to the Federal needs that Mr. Shuster was talking about earlier. But it would vary from State to State as how it was applied depending upon how those needs were represented within that State.

We are also advocating that kind of a program have an accountability program attached to it. We recommended that the States be required to have management programs—for example, pavement management, safety management, congestion management—programs designed around the Federal priorities. The States would be evaluated as to how well they were using those flexible dollars to complete those Federal priorities, as defined in those approved management programs.

So we are advocating a program here that is flexible in terms of its application, but is still Federally driven addressing Federal priorities, but recognizes the divergence of individual circumstances that exist in individual States.

The next point I would like to address briefly is the overall concept of funding. The hardest point to hold groups together, of course, is over who gets the dollars.

You have heard the representatives from Ohio make their very strong statement with regard to their concern of Ohio not getting enough dollars. Mr. Backes is very concerned that States that he represents will lose the percentage of dollars they are getting now under some of the funding formula provisions. It was a very hard-fought issue among the States at AASHTO that came up with a compromise proposal, that is in AASHTO, that represents both some preservation of the donor/donee status and some limitation of that status.

What we would like to emphasize from the Crescent Coalition is our concern that the funding formula not distort the transportation priorities. As Mr. Shuster said earlier, we believe it should be need driven and the Federal priorities and the Federal needs should drive the program and not a funding formula ending up driving the program. If, as a result of developing a funding formula that chases these transportation needs, we find individual States would result in contributing far too much than is reasonable, or other individual States would be receiving too little to maintain a reasonable program level. Then some adaptation of that formula would be necessary to protect and preserve the equity of the system. But basically it should be needs driven.

We have identified as the key factors, being not only the amount of miles that are on the system, but also the vehicle miles on the system, and then some representative of truck travel. The best surrogate that we have been able to come up with is diesel sales for a surrogate. But because trucks have such a heavy influence on our system's maintainability, we believe that is an important part of the formula.

In emphasizing the need for a flexible program and of flexible funding, let me give you an example of what happens in a major urban corridor. We might have an urban corridor that has a freeway on the highway system of national significance going through it. It may also have a couple of parallel local arterials that go right along with that. It may have a light rail system going through that also. And it may be under-served, inadequate with those facilities.

We have to address that question. How are we going to provide adequate movement of people and goods through there?

If we have a detailed categorical program, if we have funding allocations that are broken out with differing matching ratios, for example, the solution that will be chosen will be the one that draws the most funds. If we have a 90 percent matching ratio on the highway system of national significance but a 50 percent matching ratio on efforts to make other improvements in that same corridor, even though it may be a more efficient investment for us to upgrade that rail system and put some HOV lanes on those local arterials, along with timing the signals. We may get the same level of traffic service for a lot less money than trying to add a lane to the highway system of national significance freeway. We'll be driven towards that other alternative by the different matching ratios and inflexible programs and inflexible funding.

So what we are seeking here is that ability to come up with the best transportation solution in those corridors and not to have preallocated funds drive us away from the best transportation solution.

In closing I would like to mention that we in the Crescent Coalition are strong supporters for a concept of privatization. That doesn't mean turning our fine national system into a privately-run operation. It means increasing the opportunities for private investment in our national transportation system.

A number of States are experimenting with that. California passed a law this year to provide for totally privately-funded projects as long as they were parallel to an existing free route and would assist that free route. Those projects are to be awarded based upon the service level they provide—in other words, public benefits. Because of this, we think that there are a number of ways that we can see increasing private investment.

The development of transportation systems in the future is going to require us to combine the best of Federal funding, State funding, local funding, and private funding. The needs are far outstripping what we can do by any individual source.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Backes.

Mr. BACKES. Mr. Chairman and members of the committee, I am Richard Backes, the Commissioner/Director of the Department of Transportation of North Dakota.

It is an honor to appear before your subcommittee and express the views of rural Western States regarding the reauthorization of the Federal aid highway program.

First, I want to make a few comments. I want to thank the committee for the opportunity to appear with a balanced testimony of both rural and urban States and Mr. Best and the AASHTO organization. I think it is a credit to the committee to hear all of us.

The names of different coalitions have been bantered around—Crescent Coalition, generally believed to be representing urban interests; and the Bread Basket Coalition, generally considered to be representing rural interests. But the Bread Basket Coalition is kind of a moniker. That doesn't really belong there. We have no roster of members. We have no dues. We have no reports. We just have phone numbers of each other and a common interest. That is the

Bread Basket Coalition, Mr. Chairman, and I hope it continues that way. It has worked well.

Mr. Chairman, the Federal aid highway program has been one of the most successful, long-running, cooperative partnerships ever undertaken by the State and Federal agencies. Over the years the process has developed the safest and most efficient highway system in the world. It is a program that has been well managed and scandal free—and that is not always the case in such vast programs of the Federal Government.

As we enter the decade of the 1990s, we are approaching the end of another era in American history as our interstate system nears completion. The interstate system, along with its construction of the major connector system of roads and streets, has changed our lifestyles and improved our quality of life beyond one's greatest dreams of 25 or 50 years ago.

However, in spite of the success of the program we have heard some suggest that with completion of the interstate system there should be major, wholesale changes in the program. We disagree.

North Dakota and many rural Western States are concerned that if some of the proposals we have seen were implemented they would have a negative impact on our funding and ability to preserve the Federal aid system. Therefore, the rural Western States strongly support the continuation of the existing Federal aid highway program. With minor modifications the existing program will continue to provide our nation—not just some States—with the best highway system in the world.

There are basically two changes to the program that we support. First, we support an increased Federal funding level for the highway program. Second, we support increased flexibility for the States to transfer funds between categorical programs so that States have more authority in deciding how the Federal funds should be used.

On the other hand, we strongly oppose proposals to change funding formulas in a way that would reduce our funding, even if these proposals were combined with flexibility provisions.

We strongly oppose the Administration's initiative to reduce the Federal share and increase the State matching share on various programs. This proposal is devastating to rural areas, which are limited in their ability to generate additional revenue.

If State matching ratios are increased significantly, it may be impossible for rural States like North Dakota to raise the additional required funding.

In short, we support the existing highway program and believe that any changes that are necessary should be undertaken through evolution rather than revolution.

The rest of my comments will focus on why we support this position.

Transportation is not a rural or an urban issue, but rather a national issue. A citizen in rural America has the same inherent right to efficient transportation as does their urban counterpart. We realize that urban congestion and gridlock are major transportation problems that must be addressed, but we believe that rural needs are equally important. We must continue working to develop

a transportation system that meets the needs of rural and urban areas.

Federal aid highways in rural States like North Dakota serve major national interests. They serve as major connector routes for the cross-country movement of people and nationally significant commodities. The Federal aid highways in rural States serve to connect agriculture and other producers with national and international markets. The nation needs an integrated system of highways to be sure that agriculture products, forest products, minerals, and other commodities can be moved to market.

Mr. Chairman, we have such a system today because our predecessors recognized the need for a national highway system to move people cross-country and products to market. Therefore, we must maintain that donor/donee relationship for funding our transportation system if we are to have a truly national system.

The problem is not that some States are receiving too much, but that all States need additional revenue. That is the basic problem.

We are very concerned that some proposals we have seen would cut back funding for rural States. Rural America is not to be abandoned by its Federal partner now that the emphasis has shifted from the initial construction to preservation and rehabilitation.

The rural Western States agree with AASHTO and the Crescent Coalition that the first priority of the reauthorization of the Federal highway program must be to preserve the existing Federal aid system. A tremendous commitment of Federal, State, and local funds has been invested, and every effort should be made to protect and preserve that investment. At the same time, we must honor our commitment to fund the completion of the interstate system.

Reauthorization of the highway program in a way which maintains the basic program structure will help ensure the preservation of our Federal aid highway system. It is evident that funds which have been used for interstate construction are now desperately needed to preserve, rehabilitate, and reconstruct the interstate and other Federal aid highways.

The highway program is undergoing a transition from interstate construction to highway preservation. This does not mean that traditional funding principles should be abandoned.

The next highway bill should retain the current Federal/State sharing of transportation system preservation and development. We believe there remains a strong need for an ongoing Federal/State transportation program that continues or builds on the current program. The commitment should not be abandoned, and the Federal partnership should be strengthened, not weakened.

In addition, the existing categorical funding for urban highways, secondary roads, and bridges should be maintained. This is essential for addressing the needs of local jurisdictions and gaining their support and cooperation in this bill.

There are several proposals to change existing formulas for allocating Federal highway funds. Many of these proposals put more emphasis on vehicles miles of travel and less emphasis on lane miles as factors in allocating funds. This has a devastating effect on rural States that have large road networks and low traffic volumes.

There are fixed costs associated with maintaining a road, regardless of the traffic. Appropriation consideration of lane miles must be a major factor so that rural States are treated equitably.

The rural Western States are also concerned about the hold harmless provision that is included in several of the proposals for reauthorizing the highway program. In fact, the very need for a hold harmless provision shows the fatal flaw in some of the proposed formulas.

The hold harmless provision would guarantee that each State receive an amount at least equal to its 1991 authorization under the current program. However, proposals do not provide for hold harmless States to share equally in the growth of the program.

All States, including rural Western States, must receive an equitable share of any growth in any program.

The U.S. Department of Transportation has said that State and local governments should pay a larger proportion of highway transportation costs. This puts an excessive burden on States that do not have the ability to generate adequate revenue at the local level.

Increasing user fees in rural Western States like North Dakota does not generate a lot of revenue. The national Statewide average annual yield for a penny increase in the State motor fuel tax is about $26.1 million per penny. In North Dakota $0.01 generates about $4.1 million, or less than one-sixth the national average.

On the other hand, my friend, Mr. Best, from California generates over $130 million for each $0.01 of motor fuel tax. This is more than the North Dakota DOT spends annually on its entire State construction and maintenance program. It isn't that rural States are not trying to generate revenue on their own. In fact, residents of rural States pay some of the highest motor fuel taxes in the nation. North Dakota's tax is currently $0.17, South Dakota's is $0.18, Montana's is $0.20, and Nebraska is $0.22, compared to the national average of just over $0.15.

On a per capita basis, residents in rural States pay a great deal more in user fees. This is due to high motor fuel tax rates—but the fact that they often have to travel long distances to obtain basic services.

If America is to maintain its role in the world economy, the nation must commit financially to preserve and improve its transportation systems. Across America transportation needs exceed available revenue, and Western States are not exempt.

As I stated earlier, the problem is not that some States are receiving too much, but rather that no State is receiving enough.

The need for additional revenue is evident. Federal funding levels should be increased over the life of the next highway bill and all States should share equally in the growth of the program. The first priority should be to spend down the Highway Trust Fund balance, eliminate tax exemptions, and crack down on tax evasions as a means of providing additional revenue without increasing taxes. Only then should consideration be given to increasing user fees to provide an adequate, dependable, long-range program.

Rural and urban States agree that there would be benefits to increasing the amount of flexibility available to States in the current and any future program. The flexibility can take the form of allow-

38-253 O—91——7

ing the transfer of revenue between funding categories or flexibility in design standards applied to Federal aid projects.

Flexibility within the program should not be confused with establishing a flexible highway program. There is no need to establish a flexible program to achieve flexibility. It can be achieved within the current program, and we should work toward that goal.

There has been increasing pressure to use dedicated highway funds to support other programs or reduce the Federal deficit. Federal transportation facilities through user fees has been very successful and every effort should be made to ensure that these funds are protected and used for the purpose for which they were collected.

In conclusion; the future challenge is to maintain and build upon our past achievements by continuing to assure a safe and efficient transportation system promoting economic growth. After completing the interstate system the nation must be committed to preserving our transportation system, both for the interests of the citizens and the nation, as a whole.

There is a need for a concerted and coordinated effort by all levels of government to renew our commitment to preserving and improving our transportation system. The kind of highway that will bind our nation together in the future will be the result of a national program supported by State government, local officials, and highway users.

There are many challenges ahead, but I feel we can meet these challenges by working together. We can meet these challenges only by renewing the Federal/State partnership that has worked so well in the past.

In summary, the rural Western States oppose dramatic or drastic changes in the current Federal aid highway program. Some changes are necessary and, in some cases, long overdue. However, let's make these needed changes through evolution rather than revolution.

Mr. Chairman, that concludes my comments. I would be happy to respond to any questions.

Mr. MINETA. Very well. Thank you very much Mr. Backes.

Let me greet to the panel Mr. Hal Rives of the great State of Georgia. Mr. Rives, I want to thank you for your hospitality when we were down there in Atlanta.

Your statement will be made a part of the record. Please go ahead and proceed in your own fashion.

Mr. RIVES. Thank you, sir. We were very pleased to be your host.

I apologize for being late. I had a transportation problem. [Laughter.]

I will follow up on what President Justice has stated, and I will expand upon some parts of it.

AASHTO has been engaged in the past three years in studying transportation programs to carry this nation into the 21st Century. An integral part of this study is the levels of funding necessary to care for the program that has been developed.

For highways we believe that program must be funded at $17.6 billion in fiscal year 1992, rising to $25.9 billion in fiscal year 1995.

For public transportation the funding levels should be $3.5 billion in 1992, rising to $5.0 billion in 1995, along with continuing the $800 million per year in operating subsidies.

Now, these numbers did not just come out of the air. These numbers came from statistical studies supplemented by data gathered from the States and local government by the professional engineers and planners in the member departments. The statistical data came from the highway performance monitoring system which was established by the Federal Highway Administration and is operated by the member departments.

This system collects information on traffic volume and on types of vehicles, as well as the conditions of statistically selected segments of all types of highways in each and every State. The needs coming out of a study of this data were checked and amplified by needs surveys within each State and its cities and counties. The needs were then reduced to dollars, with reasonable inflation rates for the next four years.

For the public transportation component we gathered data from our member departments, as well as from the Urban Mass Transportation Administration and the American Public Transit Association. We then related these needs to large, medium, and smaller urban areas, as well as rural areas.

Modal inter-links we need, Mr. Chairman, a fully integrated transportation system. Efficient highway link-ups with airports, seaports, and railway terminals are vital. This category must be given an important part in any new surface transportation authorization legislation. The more we can make our transportation systems act as one whole system, the separate and distinct parts of which are linked together so as to achieve an efficient and cost-effective method of moving people and goods, the more efficient the overall transportation system will be.

All of the established needs and costs thereof were reviewed by professionals with respect to our changing technology, including traffic management, operational innovations, new construction materials and techniques, and other such factors in arriving at the projected cost. These funding levels are soundly based and must be considered in the authorization legislation.

A few statistics as to growth from the past 20 years may help put things in perspective as respect to needed funding levels. The surface highway and road mileage is up 25 percent. Licensed drivers are up 55 percent. Motor vehicle registrations are up 95 percent. Vehicle miles of travel are up 105 percent. And total highway disbursements are up only 8 percent in constant dollars.

You will find that our 2020 effort places a renewed emphasis on research. Our 1970 and 1980 materials and techniques have served us well, but they must be advanced as we move on toward the year 2000. Research must play a prominent role in the new program, and we at AASHTO, in developing our program, have given it one.

Over the past years, only two-tenths of 1 percent of highway expenditures have been spent on research. This is in contrast to the fact that our most basic lower technology industries spend more than eight times that on research. We did not lose our interest in research during the past two decades. We have simply been very short of funds.

There are many areas to be researched. As you well know, the 1986 Act funded the strategic highway research program dealing with pavement structures. A portion of that is a long-term pavement performance monitoring component. We must continue this component for another 15 years so that we can gain the full knowledge of how selected pavement types from all over our nation are reacting to loads imposed upon them by current commerce and future commerce.

We must study and research the intelligent vehicle/intelligent highway systems. These type of system can not only lead to safer highways, but can also lead to highways that can carry more vehicles and more people within a given time frame in a much safer manner, as well. This type of research holds great promise for our future.

Every highway program needs to have its safety components. Progress has been made in highway safety, but more needs to be done. Yes, fatality rates are down, but if further improvements are not made because of increasing traffic volumes, the fatality numbers will continue to rise.

If trends continue, over 500,000 Americans will perish on the nation's highways during the next decade. Over $1.2 trillion will be lost in highway accidents. One in every nineteen children born in this decade will die, be permanently disabled, or suffer a life-threatening injury in a highway accident during his or her lifetime.

We are a mobile society, Mr. Chairman. I hear the phrase "freedom of mobility," a guide to our society of today. Certainly this is a great freedom. It is one that Americans do not want to give up. But it is also one which they must be able to exercise in safety and in comfort, and it must be paid for. It will not come for free.

Other issues to be addressed: the Highway Trust Fund. Over the years, AASHTO has repeatedly expressed its concern about the future of the Highway Trust Fund. I think you, me, and most Americans accept the rationale of the user fee concept for supporting transportation. Consistent with this, the Highway Trust Fund must be made permanent and the monies in the Highway Trust Fund must be used for the purpose for which they were collected, including the accumulated interest on the fund.

Finally with respect to the trust fund, the gasohol exemption from the Federal motor fuel tax must be ended—especially if, in the process of enacting clean air legislation, gasohol becomes mandated in some metropolitan areas.

As you well know, the gasohol exemptions were promulgated in order to make the use of gasohol more attractive. If gasohol is to be mandated—and it appears that it will be in some portions of the country—there is certainly no need for the gasohol exemption. The exemption was a marketing tool. You need no marketing tool when its use is mandated.

We also, of course, believe that every effort needs to be made to stop the erosion of the motor fuel tax collection by the activities of organized crime. This takes away from the highway users the use of some $1 billion to $2 billion per year of the taxes which were collected from them.

Toll roads: AASHTO firmly espouses the use of toll roads, bonds, and other innovative financial methods to build and maintain our transportation systems. Certainly the toll road pilot programs—and I happen to have a pilot project in my State—should be given complete approval by the Congress for use whenever a new reauthorization bill. Increased use of bonding should also be encouraged and not discouraged.

Environment: We, of course, must protect or environment. The members of AASHTO understand that. We also understand, however, that we need a growing and vibrant economy in order to pay the price of environmental protection. It does not come cheap.

You cannot have such an economy without a first-class transportation system. There are necessary trade-offs between protecting the environment and having that first-class transportation system. We fear that the people who write the environmental laws are not cognizant of this. We view with dismay some of the environmental legislation that is proceeding through the Congress, including the bill now before the Senate that is the result of negotiations between the Senate and the Administration.

We would urge that this committee carefully review such legislation, paying close attention to such items as sanctions, Environmental Protection Agency control of the highway program in nonattainment areas, and the expanded and mandated use of gasohol without the removal of the gasohol exemption.

I would also suggest that this committee carefully review the work of the President's Task Force on Wetland Preservation. This is also a very vital issue.

Mr. Chairman, that closes my statement. I will, of course, be glad to respond to any questions.

Mr. MINETA. Thank you very much, Mr. Rives.

Mr. Justice, under the AASHTO recommendations the 85 percent minimum allocation provision and a hold harmless provision are retained for the categorical highway program. How would AASHTO propose to apportion any increased Federal highway funding above the 1991 level?

Mr. JUSTICE. I guess I would offer that we would provide an opportunity for it to work with the Federal Highway Administration to draw those conclusions. At this point I think maybe I would like to let Charlie, who worked closely on the document, reflect some of the thinking of the membership so that we can provide some direction to you on that subject.

Mr. MINETA. Mr. Miller.

Mr. MILLER. Mr. Chairman, our task force nor our policy committee specified a specific formula for distribution of current or additional funding. We did, however, indicate that there are certain basic parameters that should be taken into account—lane miles, for example, vehicle miles traveled, the normal variables. But we did not get specific at this particular juncture with respect to a funding distribution formula.

Mr. JUSTICE. I guess I would offer we would be so elated that we would quickly grasp whatever was offered.

Mr. MINETA. Given the goals adopted by AASHTO, are the objectives for the public transportation component of the surface transportation legislation attainable with the relatively modest increase

in the Federal capital funding of $3.5 billion in fiscal year 1992 rising annually to level off at about $5 billion by fiscal year 1995?

Mr. MILLER. Mr. Chairman, that recommendation, as you know from our publication of our final report on new transportation concepts for a new century, was centered around what our earlier work had demonstrated from field analyses and needs analyses that came in from our member States indicating what the current level of service was and the expected level of service.

So, in answer to your question, to maintain the current level of service, that would be sufficient. If one assumes that some change were to come about where there would be increased demand—significant increased demand from what we currently experience—then obviously more funding or higher funding levels would be required.

Mr. JUSTICE. To expand on that, Mr. Chairman, we gathered our information as we developed these numbers on a needs basis from the member departments. So we have a reasonable degree of comfort that they have expanded on their needs to identify what we believe would be appropriate in the area of public transportation.

As Director Miller has indicated, obviously, changing conditions will require changing needs.

Mr. MINETA. Mr. Best, I understand that the Pathfinder project is one that is involving the intelligent vehicle highway system. Do I understand this is a program that is about to be undertaken or has been initiated in California? What is it? What is the status of it?

Mr. BEST. It is both, Mr. Chairman. It has been in planning for some time and it is now being undertaken and put in place. It is part of the demonstration program with regard to the intelligent vehicle/intelligent highway.

The entire program goes beyond that. It includes what we refer to as a "smart corridor." It involves also the attempt to integrate the local arterials, along with the major freeway that is involved, in addition to enhancing the capability of the vehicle to interact with the conditions on the roadway.

What we are trying to do here is not concentrate just on generating a smart vehicle, but when you look at the progress we hope to be able to make by the utilization of technology, you need to have a smart vehicle—in others words, one that can gain information and use information. You also need to have a smart roadway—in other words, one that can generate that information and provide information; and then the smart driver, who can synthesize it and use it.

Until we are successful in linking all of this together into a combination, we won't achieve what looks like a tremendous potential for increasing the capacity on some of our urban systems.

Mr. MINETA. Any idea as to how long it will be before we see the benefits of this project?

Mr. BEST. Well, we will see the benefits of this project very, very shortly, but the real question becomes how long it will be before we can see any significant benefit on our systems beyond just having a demonstration project that functions. What we are faced with out there, quite frankly, is that we have the know-how to do it now. We don't need major technological breakthroughs. The technology is out there. What we haven't had is the investment to modify the

technology—in other words, the applied research to modify that technology—and then the investment to actually get it into place so it can start functioning.

I believe that it is one of those areas where the United States, for example, is lagging behind significantly what is going on in Europe and Japan, and it is an area that we really do need to substantially increase our investment so that we not only can keep pace with technological development, but that we can begin to actually see systems benefits out there within the decade.

With what we know in California where we have been pushing this program for several years, we believe we could make major progress in the application of this and see true systems benefits within a decade if we could focus our research and funds into this kind of a program.

Mr. MINETA. Have you undertaken any project involving design projects to accommodate the needs of older drivers?

Mr. BEST. In terms of physical design of the facilities, themselves?

Mr. MINETA. Signing, lane markings, on things of this nature?

Mr. BEST. I'm not aware. We do take needs into the concept of designing of signs, but I can't think of any project in California—there may be in some of the other States—where we have specifically attempted to design a road to demonstrate that by special design characteristics we could increase or decrease the problem with older drivers.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Thank you, Mr. Chairman.

We certainly appreciate your testimony today, gentlemen.

As I understand it, AASHTO has been involved in the whole question of defining what a national highway system should be, or the highways of national significance. But, of course, that means that nothing happens until we sit down with a map and start drawing lines and showing precisely what and where those highways would be.

I would be interested in your comment on where we stand on doing that. Where do you stand on giving us your recommendation on exactly what the national highway system should be, and how many miles are involved in it?

Mr. JUSTICE. Let me begin, and I would then defer to Director Miller who has chaired the task force to be a good deal more specific.

One thing is very clear: the interstate system would have to be part of any highway system of national significance.

Mr. SHUSTER. Sure.

Mr. JUSTICE. You are probably going to wind up with a significant discussion on what is going to be the ultimate number. We, after many, many discussions, kind of concluded we were looking at a system approximating 143,000 miles. That is going to be open to much discussion because out of that some will fall that are currently qualifying in the primary system and the like that those affected will not be happy with. But you have to start somewhere.

We ultimately decided to work with the Federal Highway Administration closely on this subject, and then concluded that we ought not be moving too far until we see how far this goes.

Charlie, let me let you expand on that.

Mr. MILLER. Mr. Chairman, only to expand briefly, we demonstrated through our efforts thus far that we can, indeed, come close to sitting down with that map and drawing the lines. All of the States participated, along with the Federal Highway Administration, in kind of the first iteration of that kind of an effort in late 1989. We stopped short, as Mr. Justice indicated, in concluding that activity because it is obvious that we need to look at what the Administration's new transportation legislation proposal will be and how we will weave that around it.

Mr. SHUSTER. But when do you think this committee or I can see such a preliminary map?

Mr. MILLER. Congressman Shuster, I think that certainly within the next 18 months as the process evolves and what the next round of actual legislation is going to look like, then we will be able to get down to it and perhaps finalize that.

Mr. SHUSTER. I think it is extremely important, in terms of the timing here, that we have this so we can—we have a golden opportunity with the reauthorization bill that we will be dealing with next year. That is the time to do it. I would emphasize I think you will be able to see elephants flying up in the sky before this committee or this Congress lets anybody else draw such a map. We are very much anxious to see your recommendations and suggestions, but if a map is going to get drawn, ultimately it is going to be drawn by the Congress in consultation not only with AASHTO—and obviously the Administration would play a key role. I am getting concerned. We need to begin to see such a map so we can begin to deal with it if, in fact, we are going to do that.

I am quite excited about the possibility of doing that in this authorization. I think it can accomplish many, many things, including persuading some of our friends downtown that it is time for the Federal Government to get with it in terms of helping the States do some of the wonderful things that we all know need doing.

Mr. JUSTICE. Mr. Chairman and Mr. Shuster, just to respond to that, AASHTO, from its perspective, stands ready to work with you to a conclusion to your satisfaction. It is an issue that will be hotly debated wherever we go and with whomever we are working.

The Federal Highway Administration obviously needs to play a significant role in this. We believe that we, as transportation heads of the States, need to play a significant role. Far be it from me to argue with Congress on what its will is. And so if we are asked by Congress to get that job done, we'll get it done.

Mr. SHUSTER. The starting point is a map, fellows. [Laughter.]

I want a map.

Mr. RIVES. I think we ought to give you one, Mr. Shuster. When we started this we looked at the interstate system, and then there is a category of highways known as the principal arterials. We thought at first that a combination of the interstate system and the principal arterials might come close to defining such a system. However, as we looked deeper into the principal arterials, the total combination of the interstate system plus the principal arterials amounted to, as I recall, some 180,000 miles.

Mr. MILLER. That's correct.

Mr. RIVES. We also found out that there wasn't too much definition of the principal arterials, and States even more aggressive about principal arterials had a lot of mileage; other States that weren't aggressive had very little mileage on the principal arterial system.

So it became apparent to us that there would be no reasonable distribution of the mileage if we took that at first-brush easy way to do it. But it needs to be done. We agree.

Mr. BEST. Let me add, Mr. Shuster, that I think we definitely need a map. That is very understandable. But we also have to think about a different kind of a map than we have historically thought about in the sense that certainly in some of our urban areas if a map means a highway line we are not going to be able to address that transportation problem in that area on that highway line. We have to look at it in terms of balancing the movement.

So while we go through, for example, a corridor and identify the corridor, if we look at that as being a specific roadway within the corridor that is out of date for us now in many of the urban areas. We need to have that map both identify routes where routes are important and identify investment corridors where that is more important, particularly in the urban areas.

Mr. SHUSTER. Thank you.

Mr. MINETA. Mr. Bosco.

Mr. BOSCO. Thank you, Mr. Chairman.

I have listened with great interest to the panel and thank each of you for being here.

I am concerned as much with how we distribute the money in the next reauthorization as with how it is used—how efficiently it is used. I wonder if I could pick up on a point that Mr. Rives touched on.

Eight years ago I broke the ground for the Cloverdale Bypass in my district which is a major road project. Not another spade of soil has been broken on that project since the one that I took out of the ground.

We had a demonstration project in the last highway bill that was needed by the area, would have taken traffic off of our major freeway. Nothing has been done on that.

The Century Freeway—back when I was in the legislature we were getting started on that and all kinds of housing issues came up and environmental problems. One can only imagine what that has cost in terms of delay.

In the first two instances it wasn't the funding that was the problem; it was all kinds of groups and law suits and vernal pools and historical structures and virtually the entire panoply of everything you can imagine stopped these projects.

How much does this cost you all? Is this something we should consider in this reauthorization that when we go to build a project let's build it and not take five or ten years of delays on all these things? What percentage would you say of your highway money gets eaten away by delay and by excessive reporting and regulation and such things as that? I know you don't have a specific percent, but what could be your guess?

Mr. BACKES. Well, Mr. Congressman, I can't give you a specific figure, but I have been complaining about this. I am fairly new as

a highway administrator. I only came in a year ago. But the regulations concerning fish and wildlife, archaeological, historical, DBE, is simply over-running the department. We have got archaeologists on board which we didn't have a year ago. We have got biologists on board. We have got a big civil rights division and DBE division. I would have to guess that we are eating up—not counting time loss—from 10 to 25 percent of our budget to meet some of this stuff. That is a wild guess.

Mr. BOSCO. Mr. Best, I would be interested in your answer.

Mr. BEST. Well, speaking of budget, I would say project costs could easily run 25 percent in terms of delays that are encompassed in that. The problem—I think you have put your finger on it, Mr. Bosco—is what is happening is the difficulty in getting down and deciding what to do. Once we know what to do we can turn these projects out. I have got some recent examples of that because of our recent shake-out in California.

Down by Watsonville the Strew Slough Bridge that went out, we built two parallel bridges, each 300 feet long, to replace the Strew Slough Bridge that washed out. That took us less than three months to design from scratch and construct those two parallel bridges. Normally a project of that magnitude would have taken us five to six years. We wouldn't have used the expedited processes and everything at the end, but out of that five to six years, the first four and a half years would have been deciding exactly what kinds of bridges to put in and where to locate them and how to do that through the processes that are there.

We frequently find complaints now from local governments that will come to us and will say, "How soon can you get that done." We say we are studying it. They will say, "Really, in our community there is only one acceptable route. You simply can't have it." We say, "We understand that, but we have to study all of the alternatives, even when, in essence, you get a community coalition together and virtually everybody can agree to it."

Now, in some areas, like the Cloverdale Bypass, your community will split out as to where and exactly how it is going to be built and what sort of environmental consequences are there. But even when it is not split out and you are not facing potential law suit, going through the processes and the Federal review processes that go all the way back to Washington, DC, frequently can take many, many years, and it easily will cost you 25 percent in cost escalation during this period of time. In some projects, like the Century Freeway, for example, it was quite a bit more than 25 percent.

Mr. MINETA. Would my colleague yield on that point?

Mr. BOSCO. Yes.

Mr. MINETA. You cited a special example, First of all, was that a problem caused by the earthquake? So you had a 180-day period in which to get the work done and in which 100 percent is going to be paid for by the Federal Government. So if I were in that circumstance I would bust bones in order to get that thing done right away, too. [Laughter.]

Mr. BEST. That's right. The difference is, of course, that we didn't have to go through the full processes that we normally have to go through to develop alternatives because we are on an emergency basis. But it does demonstrate you can get major facilities in place

in very brief periods of time, which I think is the issue you were concerned about.

Mr. RIVES. Congressman, I think the worst cost and the worst effect of these delays more than money is the frustration, the lack of use of the facility by the people who need to use it in terms of delay time, in terms of injuries, in terms of accidents. Actually, if we had money running out of our ears it would be more costly, because right now if a project dies or a project is deferred I have plenty of projects that I can pull back and use that money. I use that money at today's inflation costs in terms of dollars to build a mile of road.

And then later on, as that project gets off center two years or three years, I'm building it at a higher cost, yes, but I have built some other projects that were scheduled for that time at a lower cost—at today's cost.

So in terms of finite dollars, in terms of cost per project, yes. But I think in terms of finite utilization of dollars, if you can manage your program so that you never let any money sit idle, the worst effect of these is the frustration of getting it done, getting it over those regulations, jumping through the hoops, waiting for a judge to set the trial date, and these types of things.

Mr. JUSTICE. Mr. Chairman, if I might?

Congressman Bosco, if you have gotten the impression that you hit a nerve, you are right. It is one that is very frustrating for us as public officials in the transportation world.

Congressman Shuster is well aware of one that went on in Southeastern Pennsylvania for over 25 years, where we ultimately, I think, over the next year or two, are finally going to get what is called the Blue Route up in the community that he and I are both familiar with.

It is not possible to measure the cost of that delay. The traffic has grown so much since that time and caused so much inconvenience to all the people that use it, it is almost unconscionable that acts like that can happen. But the fact is that the laws are in place that require us to go through that process.

I will offer that everything that has been said is accurate. I will expand on it by telling you that it is not just the frustration but it is a time loss, for to produce an environmental impact statement to the satisfaction of those that must review it and accept it and then stand the test of court, is in the three- and four-year time frame no matter what you do. It takes us, from the time we conceive a solution to a problem to the time we start the construction, seven and eight years—and sometimes much longer.

You wonder why the public is so frustrated with solutions coming in the transportation field. Well, it is because of those restrictions that are built into our system.

Now, I recognize that those people that built those restrictions in had good cause for what they are trying to do, but I sometimes question the rigidity with which they are applied.

A case in point is wetlands that we have all faced over recent history. I have started a project in my community that has been in the books now for about 15 years. We finally got it underway, built part of the project on both ends, got to the middle of the area that was tying me up, built a bridge across it because I felt I could do

that. We discover wetlands that weren't identified previously. The rules changed along the way.

I am told that I not only have to go back and start the process over with the new rules, but I have to then do exactly as Director Best has said and study the alternatives. Three of the four alternatives that I might use wouldn't use the bridge. Now, that is just not acceptable, but those are the kinds of issues we are faced with as public works officials.

I don't know the answer to the problem, but if you hit on a nerve you really touched on one this morning. It is difficult for all of us.

Mr. BOSCO. Well, it is interesting to me, Mr. Chairman, that we are talking about the possibility of requiring State and local governments to put up a bigger match, and I hear out here 20 to 25 percent of this money virtually being wasted in this process-oriented aspect. We wouldn't need the local government and the State to put up any match if we could save that 25 percent.

I would encourage our subcommittee, as we proceed, to focus on this very issue. Obviously we are never going to—nor would we want to—not consider some of the more important environmental and cultural aspects, but the nitpicking and the extreme to which this has gone I think is a disgrace, and not only a moral disgrace, but one that appears to be costing $20 billion to $25 billion in a bill of the size that we are contemplating.

Thank you.

Mr. MINETA. Mr. Payne.

Mr. PAYNE. Thank you very much, Mr. Chairman.

I would also like to thank all of you at AASHTO and Mr. Best with the Crescent Council and Mr. Backes for the testimony that you have provided. Clearly you have done months and months of work to come to the conclusions that you have come to, and it is extremely helpful to us as we look at reauthorization.

I would like to first say I would like to associate myself with Mr. Bosco's last remarks. I think that they were excellent.

Also, I would like to touch on another aspect that I think is very important in terms of the implementation—Mr. Rives touched on it in his testimony—having to do with research.

When I was in engineering school studying civil engineering in the late 1960s I know there was a lot of research being done by AASHTO and other groups. The AASHTO standards, of course, were extremely important, and that research work was very, very important.

It seems that now that we are doing so little of it—and I was not aware that we were doing so little of it—that we could invest more dollars in research and reap great rewards from it in terms of being able to build more affordable highways and secondly, in terms perhaps of solving other problems that we deal with in our society—recycling, for instance. There has been discussion about the recycling of glass and how that might become an aggregate that could be used in pavement design and so forth.

I think there are a number of things that could be done with more effort and more resources in research.

I have two questions for the panel, and I am also interested in what Mr. Shuster asked about earlier. Without the map—and I understand we won't have the map today, and certainly that is the

thing that we most need—but, to better conceptualize the plan, you mentioned in the categorical highway program that the new highway system of national significance would be larger than the present 44,629 miles of interstate, but smaller than the 303,698 miles of combined interstate and Federal aid primary systems.

Could you, for us, give us a little bit better handle on what that number might be so that we could better understand more precisely what is being proposed to us?

My second question then would be the percentage of funds that you might see going into this category versus the flexible category of State and local funds.

Mr. JUSTICE. If I may, I'll start, Mr. Chairman.

I guess we would offer that an appropriate highway system of national significance should be something in the 140,000 to 160,000 mile range. That is just a rough number. If you tied me down I would probably tell you we were looking at somewhere around 145,000.

However, knowing a little something about legislative bodies, if, in fact, that map is drawn over here it may look like a reapportionment map. If that is true, we might negotiate it upwards. I'm not sure where we might go. However, I understand the need and desire, and we will certainly try to fulfill that request.

But I think you can offer that it is something in the 140,000 to 160,000 mile range as the appropriate number where we ought to be.

The funding is spelled out very clearly in our proposal, so let me let the task force chairman talk about it. Charlie?

Mr. MILLER. Well, Mr. Chairman and Mr. Payne, we have gone about it in a manner that is not to this point driven by a specific target number of miles, if you will, but rather interconnectivity of the system beyond the interstate highway system and cleaning up, if you will, of the existing primary route mileage.

As Mr. Rives testified earlier, the appropriateness, if you will, in today's world of the existing primary mileage as you go from State to State varies significantly. A lot of States have a lot of miles on the system for a specific purpose; other States have been very restrictive in that regard. So there needs to be, without doubt, a realignment.

But also, more importantly than that, I think the significant thing is the ability to achieve a system on that map that can address those areas that have evolved and emerged since the existing interstate system was designed and laid out in the 1940s and 1950s. Society has significantly changed in its needs for movement of goods and services and people have changed significantly over the last 30 to 40 years since that system was conceived. That has to also be taken into consideration.

So rather than try to target on a specific number of miles, we have purposely tried to stay away from that. Obviously, we have tried in our first iteration at it to look at a specific window of miles. But I think we have to go at it from the connectivity of the system. Continuity across borders and between regions I think is extremely important, and that is what we are trying to do in our first phases of it.

Mr. PAYNE. Mr. Best.

Mr. BEST. Could I just add one thing in terms of what goes on? Quite frankly, one of the big concerns is that if you don't know what is going to drive the funding formula, States are very reluctant to start talking about what is in the system. If the funding formula is going to be based 55 percent on the number of miles in the system, you are going to have States justifying all kinds of miles. If it is going to be based more like 20 percent on the number of miles of systems, you have the States justifying another set of miles. That again falls back on the concern that I expressed earlier that we would like to make sure the funding formula doesn't distort the system—that the system is driven after need.

I think any State could provide you with a map quite quickly if it knew the parameters and if it wasn't afraid it was going to shoot itself in the foot by coming up with a good, honest, solid system that was driven by some key Federal priorities like interconnectivity of economic centers and inter-linking other systems and high capacity and so forth, and then find out that the number of miles is going to control, to a large extent, the amount of dollars that come out and it shoots itself in the foot by giving and honest system proposal.

So I think that is part of one of the reasons the States have been a little reluctant to rush forward with a map, because they aren't sure what is going to happen after the map is there with regard to the allocation of dollars.

Mr. PAYNE. And I guess that is the same thing that I am looking at and trying to understand, too, as we understand this plan—the relationship between the miles of road and the funding formula, and so forth. But if we can assume for a minute that roughly 150,000 miles or so are in this first category, what would that say about the division of funds? Is that then a 60/40, 70/30, 80/20?

Mr. MILLER. Mr. Chairman and Mr. Payne, our initial work in our task force in AASHTO assumed approximately a 50/50 split between what we called our categorical system, highway system of national significance, and the more rural and urban type facilities that would be eligible under what we entitled our flexible program.

Mr. PAYNE. And that was based on roughly 150,000 miles in the first category?

Mr. MILLER. Yes. But, Mr. Chairman and Mr. Payne, we did not attempt at this juncture to develop formula or tables that would distribute funding based upon miles.

Mr. PAYNE. But in order to come up with the 50/50 I guess you made some assumptions about how many miles would be in the first category?

Mr. MILLER. Well, Mr. Chairman and Mr. Payne, it was based upon the concept that we would be in a window of miles somewhere between 150,000 and 200,000 miles—some fairly broad window of miles.

Mr. PAYNE. And so since this is at the bottom end of that window, then the 50/50 pretty much might apply in this hypothetical situation which I am asking about?

Mr. MILLER. That is correct.

Mr. SHUSTER. Would the gentleman yield?

Mr. PAYNE. Yes.

Mr. SHUSTER. It would seem to me that the solution to the funding problem is to not do it by formula. Do it the way we did the interstate system, which is define what the needs are and then, having done that, provide the funding.

Mr. RIVES. If I could respond just a little bit more to Mr. Payne and then to you, Mr. Shuster, actually, recognizing that there would be differences between the States as to the needs for the highway system of national significance and the flexible program, we recommended that within each State you could transfer from one to the other up to 10 percent. If a State had more needs on this highway system of national significance, they would have the authority to move up 10 percent. If they had problems in the other area to fit their State conditions, they could move down 10 percent. That was simply an attempt to recognize the difference that you might find in the various States.

I have a very large urban area and the rest of my State is primarily rural. That condition can be completely different in a State where you are primarily urbanized and you need more money in your urban system.

So we have that 10 percent float up and down between the two as a part of our recommendation that ought to be looked at.

Mr. PAYNE. So when you say the 10 percent float, that means you could go from a 60/40 split to a 40/60 split?

Mr. RIVES. Yes, sir. You could go from 40/60 to 60/40 between the categories that help bridge the differences between these States.

Mr. PAYNE. Thank you very much.

Mr. RIVES. Mr. Shuster, with respect to that, I believe we would all shy away from it being based upon needs. As a State administrator who has been involved in the interstate highway system from its inception, we played a lot of games with needs in order to get our estimate and increase our allocation of interstate funds. It was always a battle between us and the Federal Highway Administration pushing the needs up, pushing the needs up, adding things to it, and them batting it down.

If you have a real liberal Federal highway administrator you had a lot of needs; if you had a real tight, hard-nosed Federal highway administrator you didn't have so much needs in that interstate cost estimate. There is a lot of subjectivity in that and it ought to be more based upon population.

Mr. Baucus said that you can't base it on use alone because there is an inherent cost in having that system there. The combination of lane miles, vehicle miles of travel, and some measure of the heavy truck usage where it has diesel fuel sales, something that is a measure of truck usage. There is a combination of all those three. How you are going to weigh them we do not know yet. But we would rather see it based upon those type of parameters than just needs.

Mr. JUSTICE. If I might, Mr. Chairman, I would like to expand a little bit and clarify something for Congressman Payne. I wouldn't want us to mislead anyone here.

The 50/50 split that we proposed with the 10 percent float either way is based on the numbers in our proposal—that is to say that

the $18 billion to $26 billion that we have offered as the needs of our funding level.

Mr. MINETA. Mr. Justice, I thought it was a 20 percent float. Or are you saying it is 10 percent up or 10 percent down, therefore it is a 20 percent differential?

Mr. JUSTICE. That is correct.

Mr. MINETA. Okay.

Mr. JUSTICE. It could be as much as a 60/40 either way, which creates a 20 percent level, but it is a 10 percent float.

But if funding levels—and you touched on this, which is why I respond. We are very interested and hopeful that something like this might happen. If funding levels were to be different than those numbers, we would want to take a look at this again. That is exactly how we would play.

Mr. MINETA. If you take a look at the Secretary's announced national transportation strategy where they want to reduce the total expenditure by trying to come up with a different match or a different mix of ratios to use the Federal funds to leverage State and local government funds. To what extent, does that bias you, a State transportation director, in terms of where you are going to be spending your money on highways and/or mass transit projects? Does it bias your decisions?

Mr. JUSTICE. It certainly does.

Mr. MINETA. Now how do we lay that template over the needs identified by Mr. Backes? We may be putting dollars in areas where the needs aren't, simply because we provide a higher Federal share.

Mr. JUSTICE. It has the potential of creating exactly that scenario.

Mr. BEST. Mr. Chairman, we would think if the matching ratios that are going to be reduced are going to vary from program to program it would—as a minimum, it should be applied on a program basis and not a project basis. In other words, if a State invested so much in a program, it would qualify for the Federal dollars. But when you do it on a project basis, project-by-project, it definitely biases you to select the project that has a higher match ratio or a higher level of Federal participation.

I think it was mentioned a little earlier that even the flexible program would be expected to be expended predominantly in support of the highway system of national significance. That is what gives you the capability if you are not going to add another lane to a freeway but you are going to upgrade an arterial and those arterials are not on the highway system of national significance, then you can expend those funds out of your flexible program that will benefit the highway system of national significance and perhaps do a better job than actually spending dollars on that particular route, itself.

That is, again, why they are seeking that concept of flexibility and be able to make the best choice of decision without regard to matching ratios and to emphasize, again, that the flexible program still is in support of the Federal program and the Federal system.

Mr. MILLER. Mr. Chairman, if I might, very quickly, that is exactly the reason that our proposal from AASHTO has indicated matching ratios should remain about 85 percent and 15 percent.

Mr. MINETA. Mr. Payne, do you want to continue? I appreciate your yielding.

Mr. PAYNE. No. That is fine, Mr. Chairman. Thank you very much.

Mr. MINETA. Well, let me try something here. Under the AASHTO recommended funding levels, $17.6 billion in fiscal year 1992 increasing to $25.9 billion in fiscal year 1995 for the Federal aid highway program, would this require an increase in the motor fuel user tax in order to maintain these levels of expenditure beyond fiscal year 1995?

Mr. JUSTICE. Mr. Chairman, the answer is pretty clear. I think I covered in my opening statement that there is sufficient money on the balances in the trust fund to cover the first two years at our recommended funding levels. We believe that to be accurate. However, beyond those two years it clearly needs additional revenues.

We stand strongly in support of it and are prepared to work with this committee to try and help achieve it.

Mr. BACKES. Mr. Chairman, I would just add that obviously the AASHTO proposals didn't have to go through OMB. [Laughter.]

Mr. MINETA. Very well said.

Okay. Thank you very, very much to all the panel members from AASHTO and the Crescent Coalition and the Bread Basket Coalition.

Mr. JUSTICE. Mr. Chairman, may I——

Mr. MINETA. Yes, Mr. Justice.

Mr. JUSTICE. Before we close I want to clear something up because we purposely structured this panel to allow for all those diverse views that you hear to be heard. But I want to make it clear that this is AASHTO sitting at the table. All of these members are supportive of and we stand as one to work with this committee in representing transportation and a better transportation system for this country.

Mr. MINETA. Again, thank you very, very much.

[Mr. Justice's prepared statement appears on page 336.]

[Mr. Rives' prepared statement appears on page 395.]

[Mr. Charles Miller's prepared statement appears on page 375.]

[Mr. Best's prepared statement appears on page 285.]

[Mr. Backes' prepared statement appears on page 266.]

[AASHTO documents retained in subcommittee file: "Keep America Moving; THE BOTTOM LINE. A Summary of Surface Transportation Investment Requirements 1988–2020." By Transportation 2020; "Highway Safety Strategic Plan 1991–2000"; "Keep America Moving; INNOVATION. A Strategy for Research, Development, and Technology Transfer." By Transportation 2020; and "New Transportation Concepts for a new Century." By Transportation 2020.]

Mr. MINETA. Recognizing that we have an airplane schedule to maintain here, I would like to call forward at this time for his presentation the chairman of the Highway Division of the Associated General Contractors of America, Richard N. Moseman.

Mr. Moseman, please come before the committee. We will go ahead and enter the whole statement in the record. If you would like to summarize and proceed in your own fashion, that would be fine.

TESTIMONY OF RICHARD N. MOSEMAN, CHAIRMAN, HIGHWAY DIVISION, ASSOCIATED GENERAL CONTRACTORS OF AMERICA, ACCOMPANIED BY DAVE LUKENS, DIRECTOR, HIGHWAY DIVISION

Mr. MOSEMAN. Thank you.

Mr. Chairman and members of the subcommittee, my name is Richard Moseman, the Highway Division Chairman of the Associated General Contractors of America. I am accompanied today by Dave Lukens, the Director of AGC's Highway Division.

AGC appreciates the opportunity to express its views on the major issues facing the nation in surface transportation. AGC applauds the subcommittee for scheduling these hearings and getting on with the important task of reauthorizing the nation's highway and mass transit programs.

Today I will briefly summarize AGC's written testimony on the major issues of the future legislation.

AGC believes the transportation infrastructure is at the very heart of what makes this country thrive and prosper. Unfortunately, some tend to take our transportation system for granted until the system starts to break down. There are already signs our highway system is breaking down: many portions of the interstate system are in need of repair and reconstruction, nearly 50 percent of the nation's bridges are structurally deficient or obsolete, and congestion on urban freeways is increasing at an alarming rate. AGC believes the problems are approaching crisis proportions.

In the past year we have seen a number of issues take the spotlight—clean air, the savings and loan crisis, and cleanup of the nation's atomic weapons plants, just to name a few. All are very important issues that the Administration and Congress are trying to address. AGC believes that the transportation infrastructure crisis should join those issues on the national agenda.

Even in the current budget environment, if we can find several hundred billion dollars to bail out the ailing savings and loan industry, then surely we can find the resources to address the nation's crumbling transportation system and actually use the transportation trust funds for their intended purposes.

The construction industry stands ready to work with the Congress, Department of Transportation, and the State highway officials to address the problem; however, the Federal Government must assume the necessary leadership role to promote adequate transportation capital investment by all levels of government to meet the demands of the future.

AASHTO has done an outstanding job of analyzing the future transportation needs of this country in developing a policy framework to address those needs. While they are in a much better position to discuss their findings, AGC would like to lend its endorsement to their policy recommendation which calls for a significant increase in Federal funding for highways.

AGC believes their recommendation reflects the judgment of transportation professionals that face the nation's transportation problems every day. AGC believes AASHTO's proposal provides a sound basis on which to begin discussions and build the future legislation.

The challenges facing the country in transportation are immense, but not insurmountable. The existing Federal programs are basically sound, providing a solid framework to address the challenges of the future; therefore, AGC believes there are a number of important concepts of the current program which are critical to the success in the future. These include the following:

User fees, trust fund concepts. AGC recommends that Congress continue the concept of user-fee financed trust fund to support the nation's Federal aid highway program.

Maintain the gas tax for transportation purposes. AGC strongly urges that the Congress continue to reject proposals to increase the gasoline tax for deficit reduction or non-transportation spending.

The open competitive bidding system. AGC strongly urges continuation of the time-tested open competitive bidding system with contracts publicly advertised, bids publicly received and read aloud, and contracts awarded to the lowest responsive and responsible bidder as the means of contracting for Federally-assisted highway construction.

While the current program has generally worked well, there are a number of areas which AGC believes need to be changed. They include:

Budgetary treatment of the transportation trust funds. AGC continues to endorse the House Public Works and Transportation Committee's initiatives to take the transportation trust funds out of the unified budget process and spend the trust fund balances for their intended purposes.

Special preference programs. AGC urges the Congress to sunset the current DBE program which results in a denial of subcontracts to many individuals because of their race, gender, or national origin. Instead, the Congress should explore a means of promoting the participation of disadvantaged business enterprises in the Federal aid highway program that will not be subject to Constitutional challenge.

In closing, AGC acknowledges that the Congress faces a tremendous challenge in balancing interest in the future legislation and stands ready to work with the Congress as it develops solutions to the nation's transportation infrastructure crisis.

The immediate challenge is to make transportation a top priority on the national agenda. Only then can a common political will be mustered to begin to address our critical transportation needs and ensure the future economic growth and competitiveness of the nation.

I thank you.

Mr. MINETA. Thank you very, very much, Mr. Moseman.

Under the Federal aid highway program, construction of each project should be performed by contract awarded through competitive bidding. However, the Federal Highway Administration has indicated a desire to explore alternatives to the standard competitive bidding process as part of an experimental program.

What effect would implementation of the negotiated contract award process have on the highway construction industry?

Mr. MOSEMAN. This thrust apparently has appeared because of some complaints over project quality, timeliness, and this type of thing. But we believe—and we have discussed it very thoroughly—

that improved plans and specifications, pre-qualification of contractors, pre-bid conferences, and adequate inspection can accomplish the shortcomings that some people perceive. But we think there is no substitute for the most construction for the dollar by going to competitive bid systems, and we certainly strongly support maintaining that same position.

Mr. MINETA. I agree with you that the evidence is clear that our deficient investment in the infrastructure is having a negative affect on the future of the nation's economy. Does AGC propose to increase user fees to support the AASHTO recommended highway spending levels of $17.6 billion in fiscal year 1992 that increases up to $25.9 billion in fiscal year 1995?

Mr. MOSEMAN. AGC supports increased highway funding. We don't stipulate where it will come from, but we anticipate it would be from user fees that—we definitely support this—could be used for transportation purposes. We also would support the release and expenditure of Highway Trust Funds now held back for budgetary consideration.

Mr. MINETA. Very well.

Mr. Shuster.

Mr. SHUSTER. Thank you, Mr. Chairman.

I really don't have any questions. I just very much appreciate your testimony. I think I know clearly where AGC stands.

Thank you.

Mr. MOSEMAN. Thank you. We appreciate all of the support all of you on the committee have given to the construction industry in the past.

Mr. MINETA. Again, I want to thank you very, very much, Mr. Moseman, for being before us. We will see you in San Francisco in a couple of weeks.

Mr. MOSEMAN. I thank you for the opportunity to appear and present our testimony.

Mr. MINETA. Thank you.

[Mr. Moseman's prepared statement appears on page 384.]

Mr. MINETA. At this time let me call on Lawrence D. Dahms, Executive Director, Metropolitan Transportation Commission, San Francisco Bay Area, and Vice Chairman, Steering Committee for Transportation Advocacy, National Association of Regional Councils.

Larry, your statement will be placed in the record. Please proceed in your own fashion.

TESTIMONY OF LAWRENCE D. DAHMS, EXECUTIVE DIRECTOR, METROPOLITAN TRANSPORTATION COMMISSION, SAN FRANCISCO BAY AREA, AND VICE CHAIRMAN, STEERING COMMITTEE FOR TRANSPORTATION ADVOCACY, NATIONAL ASSOCIATION OF REGIONAL COUNCILS

Mr. DAHMS. Thank you, Mr. Chairman and Mr. Shuster.

I am Larry Dahms, Executive Director of MTC, the MPO serving the San Francisco Bay Area. I appreciate the opportunity to appear before you today. My full statement has been presented to your committee for the record.

I speak on behalf of the National Association of Regional Councils' Transportation Advocacy Group. The Advocacy Group is a special organization of NARC. We have come together to advocate the interests of those regional councils that are designated as metropolitan planning organizations—MPOs.

Our immediate mission is to address the challenges and opportunities in reauthorizing the Federal Aid Highway and Transit Acts. In this regard, over the last three years we have examined the scope and nature of our transportation needs and the necessary Federal response to help the State and Federal Governments address those needs.

We did participate in the transportation alternatives group—TAG—that has been referred to earlier today by some of your other witnesses. There were 12 public and private interest groups involved, and some surprising progress made there. We were happy to be a part of that.

I would also like to relate the thrust of NARC's conclusions as part of a general response to the Administration's proposal by comparing our vision of the future in some sense to theirs and to the positions of some of the other public interest groups.

First, I think it is useful to applaud Secretary Skinner for his success and leadership in elevating transportation to the Administration's list of priorities. He certainly deserves credit for initiating the transportation policy process which produced a comprehensive statement of the entire transportation infrastructure.

While we, like others, may have quarrels with parts of that policy statement, we do find the cup is more than half full and something to build upon.

We generally share the Administration's views of the identification of our surface transportation problems, the connection between transportation investment and economic productivity, and the adverse economic consequences from further failure to address these transportation needs.

We do part company on two fundamental aspects of the vision for the future Federal aid highway and transit program, and that has to do with Federal financial responsibility or the level of that responsibility and the fixation on the so-called systems of national significance.

I think here it is important to look at that in terms of the definition and extent. It was interesting to hear your witnesses from the AASHTO panel—in particular, Mr. Best's comments relative to the corridors within urban areas, because in a sense it is getting to the point where there are nuances of difference, I think, in some of the things we are saying.

You were advised by the AASHTO panel that a problem with defining or putting the lines on the map had to do with whether the number of miles on the map would relate to the size of the allocation, and that was difficult, not knowing what that formula might be. I think in our case there is a second problem, and that is having those lines put on the map in urban areas in overly rigid ways and not giving us the flexibility sometimes to spend the money better on parallel arterials. The concept that Mr. Best described I think might be a way of bridging that problem.

Just two years ago, though—getting back to the resource question—the National Council on Public Works Improvement, as you know, concluded its transportation sector need and indicated that a doubling of the investment in our infrastructure is needed, and it called for a restoration of Federal Government financial participation to historic levels.

In 1988 the Federal Government contributed only a quarter of the total investment by governments in highways and transit, an historic low. And State and local governments have, in fact, been taking up the slack.

If I can take my own Bay Area as an example, the Federal Government contributes less than 20 percent of our transit budget of more than $1 billion annually. More than 80 percent does come from local sources—sales taxes, bridge tolls, local general funds.

On the State highway side—and I think we may be unique in the country on the State highway side in that more than half of our five-year program for the State highways—I'm talking about primary and interstate highways—are financed by local revenues. More than half.

The Administration's proposal to redefine the Federal financial responsibility by shifting more of the financial burden to State and local governments represents a further erosion from this responsibility.

Now, the intent, as I understand it, is to get local government to put up more resources. Maybe that is something that is required elsewhere in the country, but I must say that we are stretched, I believe, as far as we can stretch with local resources in our case. Therefore, we do have to ask Congress to move beyond this proposal and to spend down the balances in the transportation funding as a starting point. And then we urge Congress to go the next step and enact an increase in Federal motor vehicle fuel tax.

Turning from the resources to the substantive program and process proposals, here again we have share many of the concerns and ideas that were expressed in the Administration policy. We are in agreement relative to the need for greater flexibility. We are certainly in agreement with the acknowledgement that our transportation infrastructure has to be an integrated system. The recognition of the need for systems management techniques as a condition of funding highway and transit project approvals is certainly one that we support.

We appreciate also the recognition of the need to strengthen the planning and the programming prioritization role of MPOs to ensure integrated transportation systems, to coordinate land use in transportation investment decisions, to organize effective programs for attaining air quality goals, and other national objectives.

We share also the recognition that transportation is vital to the nation's economy. Our metropolitan regions are the economic building blocks of the nation's economy, and we believe the Federal Government has a fundamental role in preserving and sustaining their economic health.

But today the health of our metropolitan regions is increasingly threatened by congestion. The national transportation policy clearly recognizes congestion and rural access as national problems, but seems to diminish the Federal responsibility in addressing this fun-

damental national problem. Under the Administration's plan, Federal transportation resources would be focused on facilities of national significance—the interstate and its follow-on, according to the Secretary.

But if congestion is a national problem, it cannot just be solved by widening of interstates, by upgrading principal arterials to interstate standards, or by building bypasses.

Mr. Chairman, we believe that to deal with congestion we need a metropolitan system program that will focus resources on an integrated metropolitan transportation system, and we need to have the flexibility to employ a combination of strategies—highway strategies, transit options, HOV lanes, and more effective systems management techniques.

When we propose a metropolitan systems program we are not talking about a block grant, but rather a program to assure resources are directed to metropolitan areas for use on designated metropolitan systems.

Simply put, a non-interstate system can be as critical as an interstate. The transportation system must be integrated; therefore, the resources ought to flow where they can fulfill economic needs and potential rather than to an artificially-defined national network deemed to have special significance.

Here again it is interesting to note a comparison of our concept with that of the Crescent Coalition. In seeking a measure of accountability, they talked of four plans like a congestion management plan, pavement management plan, and so forth. Our view is that that accountability can be obtained by focusing all of these four ideas into one plan.

Mr. Chairman, Secretary Skinner used a very interesting and ironic anecdote as an opening to his presentation last Thursday. He told the story of a young Northern Virginia mother who commutes several hours per day mired in congestion on an urban interstate. In so doing he acknowledged that congestion is of national interest, and we are grateful for that.

Another point, however, is that the interstate system was not designed to serve our nation's commuters, as such. It was designed to serve inter-city travel. You can usually travel easily between metropolitan areas, thanks to the interstate. But once you get within the metropolitan area you have a problem.

An inadequate investment in urban transportation systems, coupled with an almost exclusive Federal focus on funding the interstate, has forced a reliance on that system within metropolitan areas.

So I end as I started: while there are, indeed, good aspects of the national transportation policy and of the seeming coming together of many of the interest groups, we believe there are still two steps that are critical, and one is to recognize the need to provide additional revenues and, secondly, to have a real strategy to solve the chronic problems of congestion and rural isolation.

So thank you, Mr. Chairman and members. I appreciate the opportunity to testify and would be happy to answer any questions.

Mr. MINETA. Thank you very much, Mr. Dahms, for a very fine statement.

I really agree with the statement that you make at the bottom of page three of your testimony that the interstate was not designed to serve our nation's commuters, but designed to serve inter-city travel. As you say, once you get to the metropolitan area you get the problem.

Under the proposal to establish a metro system to relieve urban congestion and provide rural access, would NARC support a pass-through of Federal funds to the local governments? And, if so, which local entity should be the recipient of those Federal funds?

Mr. DAHMS. I think, first, we have to—going back to the lines on a map question. The system of national significance, whatever it turns out to be, needs to have on the lines on the map that connect the metropolitan areas. Within the metropolitan areas we can have the corridor definitions, as was suggested to you earlier.

Ultimately, though, there has to be a plan that shows what is in those corridors. Are we widening the freeway? Are we improving an arterial? Are we building a busway? What are we doing? That is the metro system plan.

Once you have that, the ownership of the several facilities may vary. Cities may own arterials, counties may own arterials, transit districts may be involved in the rail program, and, of course, the States. The backbone will still be the State system.

I think that we should be able to have a transportation improvement program along the lines of the one that we have now except that the funds could be prioritized and spent by whoever owns the facility. So it would go back to the entity that is now responsible for the facility, but the plan would have to show which entity it goes back to.

Mr. MINETA. The subcommittee has received testimony that supports a commingling of transportation trust funds in order to provide flexibility to States and local governments to meet their transportation needs. Does NARC support an intermodal transportation trust fund approach as a means of achieving greater flexibility through employment of a combination of transportation strategies?

Mr. DAHMS. Yes, we do.

Mr. MINETA. Any thought as to how that might be structured? Or does that structure exist within law now?

Mr. DAHMS. I think to accomplish it we have to recognize that there are programs like the interstate that have to be sustained, and so that basic level of investment has to be taken care of on the highway side.

Similarly, on the transit side, the transit program has to be sustained, so a section 9 type formula is needed to continue to sustain the transit side.

But for capacity expansion there is a middle ground, and for that middle ground we ought to be able to invest in whatever is the most cost-effective investment. In order to do that, we do need a formula. There was a lot of talk earlier today about a formula. There needs to be a formula that provides a budget for the metropolitan system, and there needs to be a process for a consultation of the State and local governments in order to make decisions about how to best spend those monies.

I think you could readily build upon the Federal aid urban system formula as one example in order to be able to support such a decision process.

Mr. MINETA. But does that give you enough flexibility?

Mr. DAHMS. I think that——

Mr. MINETA. Let me ask not only about flexibility, but do the matching ratios skew the decisions for the transportation investments?

Mr. DAHMS. Very important point. The matching ratios, whether it is for the national system or for the metro system, should be the same. Again, if I look at the—I am pleased to see how some of these ideas are coming together because I read in the Crescent Coalition proposal the idea that the system of national significance should be fungible money with the metro system within metro areas. That is the same kind of proposal that we are making on behalf of NARC.

Mr. MINETA. If I were to ask Mr. Backes of the Bread Basket Coalition, which is more rurally oriented, now the same question, I'm not sure I would get the same response.

Mr. DAHMS. Well, I don't know what his response would be, but I think clearly we have to take care of the rural access needs, as well, and that is part of our program.

There are any number of discussions about how many categorical programs there should be. As far as NARC's proposal is concerned, there should be three basic ones, to which you may add some other things. But the three basic ones would be to sustain the interstate, to provide a metro system program, and to have a rural access program.

In dealing with the formulas for funding those three programs, hopefully the equity that has to be taken care of amongst rural and urban States and so forth can be taken care of.

Mr. MINETA. In addition to drawing down against the balances in the trust funds, has NARC any idea as to how much of an increase in the motor fuels tax it might consider supporting?

Mr. DAHMS. NARC has not picked on a specific number, but NARC does, as noted in our testimony, identify with the Council on Public Works Improvements estimate of a doubling of investment being necessary, and a doubling of investment could readily translate into as much as a $0.09 gas tax increase at the Federal level.

Mr. MINETA. Very well.

Mr. Shuster.

Mr. SHUSTER. No questions.

Mr. MINETA. Mr. Dahms, again, thank you very, very much for your very fine testimony. We appreciate it.

Mr. DAHMS. Thank you for the opportunity.

Mr. MINETA. We look forward to working with you.

[Mr. Dahms' prepared statement appears on page 318.]

Mr. MINETA. Now, we would like to call on Judy Wright, a member of the City Council in the City of Claremont, California, and Chair of the Transportation Commission of the Southern California Association of Governments—SCAG.

Judy is accompanied by Jim Gosnell, Director of Transportation Planning.

TESTIMONY OF JUDY WRIGHT, COUNCILMEMBER, CITY OF CLAREMONT AND CHAIR, TRANSPORTATION COMMISSION, SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS, ACCOMPANIED BY JIM GOSNELL, DIRECTOR OF TRANSPORTATION PLANNING

Ms. WRIGHT. Thank you, Mr. Chairman and Mr. Shuster. I am very pleased to be here today. For the past year I have chaired a committee of our six-county transportation staffs in developing a set of post-interstate principles. You have my longer testimony on the record, and it includes those interstate principles. I am going to summarize that testimony this afternoon.

SCAG is pleased to be here as you embark on this historical task of setting the national transportation legislative policy for the 21st century. SCAG, too, has been working, as I said, to establish regional transportation policy to take us into the 2000s.

In our regional mobility plan, which you also have a copy of, we have indicated a capital need in our region of over $40 billion in the next 20 years, and an equal amount of maintenance and operating costs.

The plan is aimed toward improving our mobility and improving the region's air quality. The cost, however, must be considered in the proper context of significant efforts to reduce the demand on the transportation system and to better balance land use and transportation decisions.

Based on the work we have done; the growth, mobility, and air quality plans that we have adopted in our regions; and the post-interstate principles we have developed, we would like to focus our comments on three issues this afternoon.

First, we believe that local government, acting through a strong regional process, is an effective mechanism for addressing metropolitan mobility issues. The MPO process should be reinforced. To strengthen that process, you should clearly delineate the decisions and accountability you are placing on MPOs. Principally, we believe that the MPO role would involve making decisions on priorities for the expenditure of flexible funds aimed at addressing urban congestion problems.

Second, Congress should direct its attention to metropolitan congestion as a significant national issue. We are very pleased to hear so many people speak to that today.

Congestion costs each of us in lost time and money, loss of productivity in the marketplace, and the loss of competitiveness in the fast-changing global economy.

An efficient and effective transportation system to move people and goods is in the nation's interest. To support this, we would suggest you recognize the metropolitan system in addition to national and rural systems and that funding be earmarked for that system. The funding, while earmarked, should be flexible so it could be applied to the best solutions for metropolitan areas.

For example, in our regional plans for Southern California, including the South Coast air quality plan, we feel much more emphasis needs to be placed on transit capacity and services than on highway improvements by a two to one margin as measured in capital costs.

Third, as you reauthorize the Surface Transportation Act you should work towards creating a level playing field so that Federal law, policy, or regulation does not give bias for one mode of transport over another. There should be common Federal matching requirements for transit and highway purposes. The single-occupant automobile needs to pay more of its true cost for the congestion and pollution it is causing.

Employers spend 57 times more on parking than on ride-sharing incentives. It is absurd for parking costs to be tax deductible to the employer and tax-free to the employee and transit passes over $15 to be taxed as regular income. H.R. 2265, sponsored by Congressman Matsui, would address a part of that issue.

You should look to local areas to come up with appropriate market incentives and pricing strategies to cause this level playing field to exist so that the individual can choose and pay for their mobility choices. Your act should encourage and allow for this to happen. We view market incentives an important tool, but we want to be clear that they should not replace the funding that you need to place on our services. They should augment existing public funding, not replace it.

Funding is a critical question. Despite significant local actions in raising funds, managing demand, and providing alternatives, there needs to be continued Federal financial support and involvement at least at the current levels, if not more. We do not, however, expect Federal funding to solve our problems and get us off the hook completely. Our plans must be and are based on significant local initiatives.

Federal policy must provide flexible money to facilitate our being able to make the best uses of available resources to stimulate those local initiatives and to promote intermodal planning and decision-making.

In our metropolitan areas we can no longer think about transportation as building facilities, alone. This is an important element, but not the only one. We have to think about mobility in a systems and comprehensive context.

Federal agencies must better coordinate their programs so that we do have complimentary objectives coming from Washington. Clean air and transportation is a good place to start. It is not just what and where to build projects, but how and when they are used and how to mitigate the impacts of those choices that must be made part of our decision-making.

Mr. Chairman, we would like to thank you for holding this hearing and for your support of transportation in our area and in the country. Thank you for letting us testify today.

Mr. MINETA. Thank you very much for your very fine testimony.

SCAG, of course, is the largest metropolitan planning organization in the United States. What provisions in urban policy provide for the construction of highways and mass transit projects that also provide the flexibility that is needed in Southern California to address the whole issue of congestion and air quality concerns?

Ms. WRIGHT. We think we have a good plan for the next 20 years that will allow us to build such a system if we can achieve the funding necessary. We have a rather ambitious rail program, as you know, that is on the way. We have a line opening in July. We

are now in the process of buying rights of way from the Southern Pacific and Santa Fe Railroad to have a commuter rail system. We are looking at market incentives as part of the Clean Air Act to allow us a measure that we can use for vehicle miles reduced. We are looking at systems management. Our plan includes demand management, systems management, and facilities, and we think, if funded, we can help to solve some of our congestion problems in California.

Mr. MINETA. From what I understand, SCAG has taken a number of innovative approaches such as assessing significant increases in parking fees and congestion charges on the freeways to encourage use of mass transportation alternatives. Now, what can we, at the Federal level, do to further build on the kinds of initiatives that you have undertaken?

Ms. WRIGHT. I think that the act, when reauthorized, can encourage these kinds of programs. We have also been working with Congressman Waxman on the Clean Air Act to include the congestion charges or user charges for the automobile as a measure to include in our region for air quality. I think any encouragement we can have from the Federal Government—we are not necessarily asking for prescriptive measures, although perhaps in looking at user charges you also may be looking at some of those programs.

Mr. GOSNELL. Mr. Chairman, I am Jim Gosnell. I think there are current restrictions on Federal roads on the ability to assess additional fees. You have begun to address that on certain toll road capabilities.

I am sure if we proceeded with congestion charges per se that we would probably have to look at the kind of restrictions currently on the books to change those so that we might proceed with that kind of approach.

Mr. MINETA. Isn't that one of the major arguments that was used originally against what is going to be on the ballot in California in June known as SCA 1 as related to the congestion management plan? Didn't that raise the ire of a significant part of our industrial or economic sector out there?

Mr. GOSNELL. Well, the congestion management plan question that was raised by a number of parts of the community was related to levels of service and if we would be able to maintain the level of service that was indicated in the law. If not, there was some concern that the law would preclude additional development from occurring.

There have been some amendments to the law, and I think those issues at least have been addressed for the time being. So there is still the support.

Ms. WRIGHT. Congressman, local government supports the congestion management plan as adopted by the legislature. I think it was the building community that was opposing it. I think a compromise has been reached.

But, to answer the question you asked before about whether local government could receive Federal funds that would help in congestion management, we see these congestion management areas as being proper areas to receive funds to help solve congestion problems in the area.

Mr. MINETA. Thank you very much, Ms. Wright and Mr. Gosnell, for your presence here today.

[Mr. Wright's prepared statement appears on page 421.]

Mr. MINETA. At this time let me call forward the Chairman of the American Road and Transportation Builders Association, Charles A. Machemehl, Jr., who is accompanied by Doctor T. Peter Ruane, the President and Chief Executive Officer of ARTBA. I see a dear friend of longstanding. I don't want to call him an old friend, but a friend of longstanding, Dan Hanson, who is accompanying you there, as well. I always like to acknowledge the presence of Dan Hanson.

Let me welcome you, Mr. Machemehl, and again thank you for your hospitality.

Your full statement will be made a part of the record. Please proceed in your own fashion.

TESTIMONY OF CHARLES A. MACHEMEHL, JR., CHAIRMAN, AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION, ACCOMPANIED BY T. PETER RUANE, PRESIDENT AND CEO, AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION, AND DAN HANSON

Mr. MACHEMEHL. Good afternoon, Mr. Chairman and members of the subcommittee. I am Charles A. Machemehl, Jr., the 1990 Chairman of the American Road and Transportation Builders Association. Professionally, I am the Vice President of Marketing and Business Development for Vulcan Materials Company, the world's largest aggregate supplier, based in Birmingham, Alabama.

I am accompanied today by Dr. T. Peter Ruane, ARTBA President and Chief Executive Officer.

As you know, ARTBA's 4,000 members nationwide hail both from the public and private sectors. We represent not only construction firms, but also State and local transportation officials, manufacturers of equipment, consulting engineers and design firms, material and safety device suppliers, and educators in the field of transportation planning and civil engineering.

On behalf of our membership, thank you for inviting us to provide our views on the structure and funding of a Federal-aid highway program for the future. As every member of this subcommittee is well aware, our Federal highway system, the backbone of the U.S. economy, is in serious trouble.

According to the U.S. Department of Transportation's 1989 report to Congress, more than 28 percent of the bridges on the Federal-aid system are either structurally deficient or functionally obsolete. The same report shows that more than 40 percent of the pavement on the Federal-aid system is in fair or poor condition.

DOT's 1989 report and the Federal Highway Administration's 1988 publication, America's Challenge for Highway Transportation in the 21st Century, both state unequivocally that meeting existing capital needs on the Federal-aid highway system, alone, will require a $40 billion per year investment—a rate of spending substantially in excess of the level of current obligations for the Federal aid highway program.

Meeting these quantified needs is one of the greatest financial challenges facing the nation. Of one thing we can be sure—failure to maintain an adequate national highway system will have a profound negative affect on our economy, the ability to meet national defense requirements, and the quality of life for every American.

Disinvestment has caused much of our current problem. Total public capital expenditures for highways and bridges has dropped from 1.4 percent of GNP in the early 1960s to about .5 percent today. During this same period, traffic on the system increased five-fold.

Inflation has also been a hidden factor. Between 1959 and 1988 the U.S. inflation rate, as measured by the CPI, rose just over 300 percent. The federal highway user fees, however, have increased only 100 percent over this period. Assuming a moderate future inflation rate of just 4 percent per year, the Federal gasoline user fee would have to increase to 26 cents-per-gallon by the year 2000 just to maintain its 1959 purchasing power.

The solution to our highway problem is obvious. We must begin investing in the future. Providing adequate resources is the key. We must spend the current cash balance in the highway account of the Highway Trust Fund, but that, alone, will not be enough.

The Byrd amendment ensures that the Federal highway program never operates at a deficit by requiring a minimum cash balance in the trust fund. Spending the current balance down to that point will provide between $5 billion to $8 billion, an amount that will not significantly increase the current program.

Apogee Research, a leading public works consulting firm based here in Washington, has developed a computer model for us which allows the review of possible program funding scenarios and their effect on the trust fund balance and program spend-out. We will share this information with the subcommittee and its staff as it is developed.

With the balance in the Highway Trust Fund not sufficient, we believe the highway program reauthorization bill should provide $40 billion per year for highway and bridge improvements beginning in 1992 and continuing for a minimum of five fiscal years. A Federal investment of this magnitude is totally consistent with the capital needs that have been identified by the U.S. Department of Transportation.

To authorize and carry out a program at this level we recommend that the Congress take the following concurrent actions:

One, ensure that all user fee revenue contributed to the Highway Trust Fund plus interest earned on that money is spent in a timely manner.

Two, increase the Federal highway user fees effective in fiscal year 1992 to raise that additional $25 billion per year that is necessary to support a $40 billion per year Federal-aid Highway program.

Three, remove the Federal aid highway program from the unified Federal budget to ensure that future user revenues are not impounded.

Four, forbid the imposition of artificial obligation ceilings on the expenditure of Federal highway funds.

Five, repeal the current 6 cent-per-gallon Federal tax exemption on gasohol sales that cause an estimated $500 million per year loss to the Highway Trust Fund.

Six, tighten Federal highway motor fuel collection procedures.

Highway users recognize the importance of well-maintained highways and bridges. They also realized that continued expenditures must be made in order to maintain system performance at an acceptable level. The unwillingness of the Federal Government to raise and spend sufficient funds to maintain system performance has resulted in program gridlock. Now is the time for bipartisan leadership in the transportation funding area.

Mr. Chairman, our detailed recommendations on how a $40 billion program would be put to work are found in the full statement that has been given to the subcommittee.

Before I close I would like to say that we commend President Bush and Transportation Secretary Skinner for elevating the national dialogue on transportation needs through the development and release last week of a proposed national transportation policy. We have reviewed this document and believe it represents a good first step. It contains many good ideas. But I would be less than candid if I did not say that we are concerned that the proposed policy does not adequately address program financing.

Mr. Chairman, America is literally at a crossroads. We can continue to ignore our serious and growing highway and bridge problems, or we can choose to make investment—about $40 billion per year—that is necessary to rebuild and expand our national highway network to meet future demands.

Good roads save lives, improve productivity, enhance competitiveness, and reduce pollution-causing, energy-wasting traffic congestion. In short, highways are an investment in the future. Together let's build a better America through transportation.

Thank you again for the opportunity to present our views. Peter Ruane and I stand ready to answer any questions that you or your subcommittee may have. Thank you.

Mr. MINETA. Thank you very much, Mr. Machemehl for that very comprehensive statement. Frankly, I want to take advantage of your offer of sharing the information that you are going to be developing through Apogee Research because I think that will be very, very important as we continue down this road of the authorization legislation.

Mr. MACHEMEHL. Yes, sir.

Mr. MINETA. Mr. Machemehl, in your testimony you have very clearly highlighted the need for investing adequate resources in the future of the Federal aid highway program. However, would the proposal for increasing the authorization levels to $40 billion per year, which would be supported by an increased Federal motor fuels tax, preempt the States and their ability to raise sufficient local revenues to match the Federal requirements?

Mr. MACHEMEHL. No, sir, I don't believe it would. We had a study done by—was it Apogee, Pete?

Mr. RUANE. Yes. Apogee Research.

Mr. MACHEMEHL. We have a study which shows the dollars necessary to match on a State-by-State basis. I have had the opportunity to talk to some States, and the ones I have talked with do not

seem to feel it is a problem. In fact, I would say just the opposite. I would think it would be a motivator to the States to go out and raise their user fee to match the Federal program. I look at this as something that needs leadership, and I think that is the leadership that you all can provide.

Mr. MINETA. What level of increased Federal highway user fees is ARTBA advocating in support of an annual $40 billion Federal program of highway improvement assistance?

Mr. MACHEMEHL. Sir, we believe it would take about 15 to 18 cents per gallon increase in the user fee to provide this program. That is what our research shows. Is that right, Pete?

Mr. RUANE. That is correct.

Mr. MINETA. At the conference that you sponsored on public/private ventures in transportation what new public and private initiatives were proposed for funding the nation's transportation needs? Since Secretary Skinner's national transportation strategy calls for an increased level of private sector involvement, what kinds of new ideas came from your conference?

Mr. MACHEMEHL. I would say the primary thrust of that conference was private financing for toll roads. While toll roads have a role, what you all need to keep in mind is that the toll roads we are talking about, although I think they are important and we should pursue it and ARTBA has taken the lead in that area, are not a substitute for the public transportation system. In cases where you think the public system might compete with you, you don't follow up on the toll road.

Vulcan Materials is working on one toll road as a group right now, and you have to be very sure that there is not a public system there that might compete with you.

My point is that they are going to supplement the public transportation system or the highway system, but they are not going to be able to be used instead of or in lieu of. I think that is a point that you all need to realize, because on the private side you have got to make sure when you build these roads that the tolls will pay for the road in a private system. That is an important point. It is complicated but important.

So the thrust of that conference was toll roads.

Pete, do you want to add to that?

Mr. RUANE. Yes.

Mr. Chairman, I would add that we do believe, as a result of that conference and studies we have done ourselves, that there are, as Secretary Skinner has identified in the policy statement, opportunities with bridges and with private ownership or leasing of airports. The proceedings of that conference will be available any day now. We will make available to the committee for your review as part of the considerations for the reauthorization those proceedings.

We believe that public/private ventures do have a role to play in the future transportation development needs of the nation. But again, as Mr. Machemehl indicated, it is an additive kind of situation rather than a replacement of Federal financing.

Mr. MINETA. Is the Tri-borough Bridge Authority considered a model along this line?

Mr. RUANE. I would hate to put a label or a model on any one, but there are a number overseas as well, in Europe that do provide insight that we could use here in the United States. There are some toll road projects in California that are emerging that might also provide some insight that we could use.

Mr. MINETA. One of the problems that I see is that in the past we have done a good job in terms of capital improvement but we haven't done enough in terms of maintenance programs. Somehow it seems to me if we are going to put out these kinds of massive capital improvements that we should not let these things deteriorate over a period of time. Also, there ought to be some kind of a built-in management program.

I see that in the Tri-borough Bridge Authority, Robert Moses not only made sure that there was adequate funding, but that there was also a maintenance program.

When I look at New York City and look at the Williamsburg Bridge and when I look at San Francisco and look at the Golden Gate Bridge, they were built about the same time. The Williamsburg Bridge is in a state of disrepair, and the Golden Gate Bridge is in good shape. Even considering all New York bridges, you take a look at the City of New York bridges and then you take a look at the Tri-borough Bridge Authority bridges, you see there is a big contrast. I think it is because there are adequate funding sources to make sure that maintenance is an integral part of what they were doing.

Mr. MACHEMEHL. Yes, sir. Mr. Chairman, two other points on those toll roads. When you go across State lines that needs to be addressed in the bill that you all are working with. We are working on one right now where we are trying to cross State lines. It is a tremendous problem to work with two State legislatures to get this thing done.

The other thing is that there needs to be some type of tax consideration on a lot of these projects because at the very front end there is a problem of the capital investment. So there are several issues in the toll roads concept that need to be addressed, and probably in the legislation that you all are working on right now.

Mr. RUANE. Mr. Chairman, if I might add, we are holding a second conference in the fall on the West Coast on public/private ventures. Additionaly, ARTBA has recently formed a new Advisory Council of experts in this field from throughout the United States and overseas. We should have additional insight that we will provide in ample time for this committee to consider as part of the reauthorization process.

Mr. MINETA. In your recommendation for funding, you are very specific as to the Federal aid highway program areas. If you can explain how, ARTBA derived the proposed allocation? For example, ARTBA has recommended an annual level of $500 million for the emergency relief program. The Administration would probably argue that an annual $500 million emergency relief program is not justifiable based on past disasters. I am wondering if you could enlighten us on that.

Mr. MACHEMEHL. Do you want to take that one, Pete?

Mr. RUANE. We are not predicting any additional earthquakes or hurricanes to justify this allocation. More flexibility for the Depart-

ment of Transportation is needed so that resources are readily available and Congress don't have to go to any special appropriations post facto the disaster. That is the primary reason for enlarging the allocation in that specific area. With respect to the overall allocation, the ARTBA numbers are based on the needs of the various federal categories as discussed by FHWA in its 1987 conditions and performance report.

Mr. MINETA. Thank you very much.

Mr. Shuster.

Mr. SHUSTER. Thank you, Mr. Chairman.

I appreciate your testimony, gentlemen.

You say in your testimony that one of the things that you recommend is that we assure that the latest in pavement design technology is utilized in this effort to maximize the return on investment. How serious a problem is this? What is happening out there that causes you to say this?

Mr. MACHEMEHL. Right now there are two kinds of pavements basically, as you well know—rigid pavement and flexible pavement. The biggest problem with flexible pavement is the rutting. It is a serious problem. I think the researchers in the asphalt industry have a handle on it, but I think that is what is happening.

On the rigid pavement side, the research needs to be accomplished on how you get the concrete pavement down fast. In the areas where you really need the rigid pavement you need to develop methods of getting the material down quickly so traffic can get back on it.

Whereas you can put the flexible pavement down—asphalt pavement—quickly, you really need, in the high traffic areas, the concrete pavement. Research I think what we talking about is probably more than basic research. We are talking about applied research.

As you get into this, you are going to find out that the $150 million SHRP program was probably just a start of what is really needed in the way of research, and that is why we recommend our figure as high as we have got it. There are several things that we need to do. They are not flashy. It is not like putting a man on the moon, but it is certainly important if we are going to maintain this biggest investment that we have probably got in this country—our Federal-aid Highway System.

Mr. SHUSTER. Thank you very much, Mr. Chairman.

Mr. MINETA. Maybe if we don't have the highways we will never get to the man on the moon.

Mr. MACHEMEHL. Yes, sir. I think that is right.

Mr. MINETA. Well, let me thank you again very, very much for your very thorough testimony. I look forward to getting help from you on the research that you develop through Apogee Research Company.

Mr. MACHEMEHL. Thank you.

Mr. RUANE. Thank you, Mr. Chairman and Mr. Shuster.

Mr. MINETA. Thank you very, very much Doctor Ruane and Mr. Machemehl.

[Mr. Machemehl's prepared statement appears on page 353.]

Mr. MINETA. I would now like to call on Alan Smith, the Chairman of the Highway Users' Federation and Executive Vice Presi-

dent of General Motors Corporation, accompanied by the President of the Highway Users' Federation, our good friend Les Lamm.

Mr. Smith, it is nice to have you here with us. I appreciate again the fact that you have a transportation scheduling problem, as well, in your accommodating our schedule here today. Your full testimony will be made a part of the record. Go ahead and proceed in your own fashion, sir.

TESTIMONY OF ALAN SMITH, EXECUTIVE VICE PRESIDENT, GENERAL MOTORS CORP., CHAIRMAN, HIGHWAY USERS' FEDERATION, ACCOMPANIED BY LESTER P. LAMM, PRESIDENT, HIGHWAY USERS FEDERATION

Mr. SMITH. Thank you. We are glad to be here.

Mr. Chairman and members of the subcommittee, thank you for the opportunity to appear here today.

My name is Alan Smith. I am Executive Vice President of General Motors Corporation and Chairman of the Highway Users Federation for Safety and Mobility. With me today is Les Lamm, President of the Federation, who has appeared before you frequently.

We greatly appreciate the subcommittee's early attention to this most important issue of surface transportation reauthorization.

You have received copies of our complete testimony. To conserve time, I will cover the highlights here.

The Highway Users Federation is a national coalition of businesses, industries, and associations working to improve the safety and efficiency of America's highway transportation system. Our private sector membership speaks for more than 30 million commercial and private users of the nation's highway system. We represent those who pay State and Federal highway user fees. Our major concern is whether the travelling public is receiving full value for the taxes we pay.

Mr. Chairman, I like to think that the Federation's constituency is not only organized groups and businesses, but also the average, hard-working American driver who depends on his car or truck to get to work and the store, drive the kids to school, and go on vacation. These highway users invest in good roads through payment of fuel taxes and other highway user fees, and they expect safe and efficient systems.

GM has been a supporter of the Highway Users Federation and its predecessor organizations since their founding in 1932. My participation with the Federation started in 1981.

Our participation in the Highway Users Federation is only one example of GM's long interest in the transportation and highway system. Our exhibit at the 1939 New York World's Fair, Futurama, demonstrated our perception of the highway system of the future. Our visionary model was a precursor to the interstate highway system, and suggested ideas now included in current transportation technology.

GM is now looking to the future as a leader in the development of intelligent vehicle and highway systems, so-called "smart cars." A publication highlighting some of our IV/HS activities is included with our statement.

As the world's largest supplier of vehicles, and also one of the largest shippers, GM takes a keen interest in the nation's transportation system. An efficient, effective transportation system is vital to the production and distribution of our vehicles and service parts.

GM has 141 facilities in the U.S. that ship or receive component parts, raw materials, and/or finished vehicles. Of these, 29 are car and truck assembly plants. We are the largest customer of many U.S. motor carriers, spending nearly $2 billion annually. Good access to safe, well-maintained highways is vital to our success in a competitive market.

Approximately 240 trucks are required to support the daily activity of a typical assembly plant—material and supplies inbound, finished vehicles outbound. Taken in total, approximately 7,000 trucks provide daily support to our 29 assembly plants. We estimate an additional 7,000 trucks are involved daily when GM's manufacturing and stamping plants are considered. Trucks carrying GM materials and products operate in all 50 States in an average day. The percentage of our transportation dollars spent in the U.S. for motor carrier service has increased from 45 percent in 1979 to 56 percent last year.

Much of this increase dependence on highway transportation is a result of efforts to remain competitive. We try to ship components just-in-time to meet very precise production schedules.

One goal of just-in-time is to minimize inventory. Making smaller, more frequent shipments permits us to control and reduce in-plant inventory. Likewise, in-transit inventory can be minimized by reducing the time shipments are in transit.

Motor carrier transportation is generally faster than rail, so business that was traditionally thought to be rail-captive is now handled over the highway. Speed, consistency, and reliability are all factors in this transition. If the trend of the last few years continues, we can expect even greater reliance on the highway network in future years.

Virtually all American manufacturers are making the same shift to just-in-time scheduling and are becoming more dependent on highway service.

In 1987, highway freight and passenger transportation expenditures accounted for 15 percent of GNP. This represented $814 billion, a clear statement of the importance of the highway system to the total U.S. economy.

Of course, GM's interest in the highway program goes beyond the efficiency of the system in supporting the manufacturing process. It is equally important to us that the driving experience for our customers be as safe and efficient as possible to provide markets for the vehicles we build. We still believe strongly in the statement of former GM Chairman Albert Bradley. He said, "We may think we sell cars and trucks, but what we are really selling is mobility. Our cars and trucks must be well-designed and well-built, but if they cannot be used efficiently and enjoyably, they will be of no more value than a canoe in the desert."

The committee has received copies of a recent Highway Users Federation brochure which describes the nine-point highway program of the Federation. This proposal reflects the concerns expressed by the people in 65 public forums held by the Federation,

and we believe presents a logical highway plan for the post-interstate era.

The nine points of this program are as follows:

One, protect the interstate system. Interstate highways carry more than 22 percent of all travel, though they consist of about 1 percent of the nation's road system. The physical and operational condition of the interstate system must be kept to a very high level through an ongoing program of restoration, rehabilitation, resurfacing, and reconstruction. There should be an annual Federal aid commitment of $4 billion for these activities.

Second, create a national arterial system. Another 3 to 4 percent of the nation's highway system carries another 30 percent of vehicle travel. A program is needed to upgrade these priority routes with safer designs, controlled access, and additional lanes where needed, and bypasses and arterial roadways in growth areas. The Federation recommends an annual Federal aid budget of $6 billion for this program.

Third, restore metropolitan mobility. The Federation proposes a five-fold increase in the Federal commitment to helping people get around town through a metropolitan mobility program for areas with populations over 50,000. This would be a different type of program, reducing red tape by allowing State and local authorities more flexibility to spend the funds on any surface transportation capital investment. The Federation recommends annual Federal funding of $4 billion for these efforts from the Highway Trust Fund, coupled with $3 billion per year from general funds for high-cost transit programs such as subway systems.

Fourth, connect rural America. Local governments cannot provide for our rural mobility needs alone. Major Federal assistance is needed to keep rural roads and bridges safe and serviceable. The Federation recommends the establishment of a flexible, rural, small-city program to support highway or public transportation improvements in rural areas and cities with populations below 50,000. Federal aid funding for this should be $2 billion annually—more than triple the size of today's secondary program.

Fifth, keep bridges safe. The Federation proposes a State-managed bridge program which would use Federal aid funds to ensure that all highway bridges receive proper inspection, maintenance, and rehabilitation or replacement regardless of what system they might be on. Annual Federal aid funding for this effort would be $2.5 billion.

Sixth, improve traffic safety. While each of the elements of our proposed highway program would bring additional safety benefits, additional Federal funding is justified to eliminate roadside hazards; improve signs, signals, and markings; and to support non-engineering activities such as safety belt and child safety system use, alcohol and drugged driving countermeasures, driver education, traffic law enforcement, and the regulation of commercial vehicles. We believe these programs should be financed at about twice today's levels.

Speaking of safety belt use, we support the Administration's goal of increasing belt use from the current level of just under 50 percent to 70 percent by 1992.

Seventh, research and development. Research can provide major dividends in the form of better highway operations and safety. We realize it is not possible in all cases to address traffic congestion through the addition of more lanes and highways. We will have to augment traffic capacity through the use of new technologies which allow the road system to be used more efficiently and make it safer for all drivers.

The Federation recommends a specific ten-year public/private development intelligent vehicle-highway program dedicated to putting smart cars on smart roads. Such a program will provide drivers with electronic aids to warn of hazards, give locations and provide destination headings in all weather and traffic conditions. The focus of this program should include the research and development of new technologies, but should also place as much emphasis on the implementation of current technology wherever possible. We recommend an annual Federal budget of $100 million per year for the smart car/smart road program, to be matched by the commitments of private industry in a ten-year program. Other FHWA research activities should also be expanded.

Eighth, develop scenic and public lands roads. Tourism is a major source of income for many States. The nation needs a coordinated program of scenic roadways to enhance tourism. The Federation recommends $300 million in annual Federal funding for Federal lands access efforts. The new scenic roads program should be eligible for all regular Federal aid programs rather than having a program of specific funding.

Ninth, assure better planning. The $22.9 billion in total Federal expenditures recommended under the Federation program demands more and better coordination of transportation and private development decisions to assure that both support community goals. This is a process which has failed too often in the past. State and local planning should be strengthened by this proposal, and Federal aid transportation projects would have to conform to an established, long-range plan meeting specific, locally-set development goals and priorities. This effort would be funded by an increased percentage of Federal highway and transit program funds.

While recommending higher expenditures for highways in order to meet existing and future highway needs, the Federation is not suggesting a change in the historical proportions of Federal, State, and local funding—that is, roughly 25 percent from Federal, 50 percent from State governments, and 25 percent from local governments.

We believe our recommended programs and funding levels can be supported through 1995 without any additional Federal highway user taxes. Our program would require that current funds available in the Highway Trust Fund be fully utilized; elimination of the excise tax exemption for gasohol—almost $500 million in 1989; making full use of the interest earnings of the trust fund—more than $1 billion annually; and drawing the balance of the Highway Trust Fund down over the reauthorization period to a reasonable level of $2 billion to $3 billion.

We believe any proposals to increase Federal highway user taxes should be deferred until the present excessive trust fund balances

are drawn down and the funds productively used for their intended purposes.

State and local governments can use this four-year window to reexamine and adjust their user fees if necessary to fund their portion of an expanded program.

We were most pleased by the recent White House release of the national transportation policy, an event that all of us in the transportation community had been eagerly awaiting. Secretary Skinner is to be commended for completing this process and helping to move transportation to a higher position on the nation's policy agenda.

The findings of the DOT's public outreach effort confirm much of what the Federation and others found through the Transportation 2020 process in 1987 and 1988. A more-detailed reaction is contained in the enclosed Federation summary to its membership.

We specifically commend the Administration for recognizing the need to invest in America's transportation system and for the promise to fully use the funds that people have paid in transportation user charges for investments in transportation.

Our private sector members completely support the concept of greater public/private cooperation for a more effective future highway program. We will do our part to make this work.

The Federation welcomes the opportunity to serve as an interface between public and private interests in developing an even stronger cooperative approach for the future national highway program. For example, the Federation, in conjunction with General Motors and the Department of Transportation, is sponsoring a leadership conference this May on the implementation of intelligent vehicle-highway systems. This event, to be held in Orlando, Florida, will bring together the business and government policy makers who will actually put such technology into production and use. Rather than focusing on the technical aspects of IV/HS systems, this conference is intended to develop a systematic plan for the implementation of existing technologies and those which will become available in the future. We hope this event will provide a model for future cooperative efforts to address other major issues facing the highway program.

We offer you the full cooperation and resources of the Highway Users Federation in the coming months. We are actively working to heighten the nation's awareness of highway needs at many levels, from individual drivers to the officers of corporate America. We know that all Americans are dependent on safe and reliable transportation for our health and welfare and our growing economy.

Mr. Chairman, we appreciate this opportunity to review the Federation's highway program proposal with you. Mr. Lamm and I would be pleased to answer any questions you might have.

Thank you.

Mr. MINETA. Thank you very much, Mr. Smith, for your very thorough and complete statement.

Based upon the research effort that General Motors is undertaking and conducting on the whole issue of intelligent vehicles and intelligent highway systems have you had any kind of indication of the significant benefits to be derived from that program when or in

terms of it being applied—toward solving our congestion and highway safety problems?

Mr. SMITH. We have studies. I guess I would say we have paper studies more than anything else. The actual putting this into place has really just begun. We have an experiment going on in California in the Los Angeles/Santa Monica corridor to utilize better communication and information about congestion to route traffic over alternative roads. We have the project that we are going to kick off in Orlando in the very near future.

But certainly everything that we have—I think you have our brochure there—suggests that there are substantial benefits available.

Mr. MINETA. This is to really improve the flow of traffic?

Mr. SMITH. Right. I guess it involves two things. So far it mainly revolves around better information—information about congestion so that you could take alternative routes. Better information about where you are going is part of it. That is going to be part of the Orlando experiment so that, for instance, a tourist who arrives in Orlando and wants to go to Disney World or to Sea World can do that in an efficient way without jamming up the roads, going four different places and being in the wrong place. It is a more efficient way to move people across time and space. That is part of it.

The California project has parallel roads in a 12-mile corridor and provides information as to which roads are open or the least congested so that you can move traffic through with the least resistance.

Beyond that it goes on to questions of safety on the road. It goes into warning. For instance, down the road somewhere are electronics that would alert the driver that he or she is approaching the edge of the road. It could control traffic. Somewhere out in the future it might provide the most efficient headway between vehicles. Those things are more, as I said, out in the future.

What is here right now and very much available is better communication techniques, navigation, information on road conditions, information on destinations and how to get there.

Mr. MINETA. Just out of curiosity, does that use a global positioning satellite—GPS? What does that utilize?

Mr. SMITH. There are two techniques. There is one that involves that. That is kind of in the future, just coming on now. And there is another process that has been available longer which just takes a local area and, in effect, positions the car on a local electronic map and you just move across that map. That is a more cumbersome process, and I think what comes in the future is going to be the satellite positioning.

Mr. MINETA. Does it help me to get from here to 123 Main Street?

Mr. SMITH. Yes. It can. Some day it will.

Mr. MINETA. Last week the Administration announced its new transportation strategy, as you indicated. In that document it talks about spending down the trust fund balances over time in a "fiscally reasonable way." Does the Highway Users' Federation interpret the Administration's statement to support drawing the Highway Trust Fund balance for a program funding level of $22.9 million per year?

Mr. SMITH. Les, do you want to answer that?

Mr. LAMM. The figures we have, Mr. Chairman, would show that the $22.9 billion, which includes $3 billion general fund for transit, could be supported out of the expected trust fund balance beginning in fiscal year 1992. It could be supported either through 1994 or 1995, and we would defer to the actual figures out of either Treasury Department or DOT who manage the trust fund.

Mr. MINETA. In order to address the shortfall of Federal funds for the nation's transportation needs, there must be greater public and private sector cooperation. What effect would the use of Federal funds for the construction of toll facilities have on the manufacturing industry that is greatly dependent on the nation's transportation system for the shipment of component parts, raw materials, and finished vehicles?

Mr. SMITH. Well, we would expect a continuing process of building of non-toll facilities—roads and bridges that are built through the current processes, to provide the backbone and the majority of the mileage that would be needed to ship our goods.

We view the use of toll roads in specialized situations.

Mr. MINETA. Is the Federation's position that the requirements for matching funds on highway projects should vary depending on the type of highway project being funded under the program?

Mr. LAMM. We would fairly closely stick to the current Federal/State matching ratio, Mr. Chairman. We would like to give some kind of priority in the form of a somewhat larger Federal share for controlled-access highways. We believe that is the highway project that carries traffic most efficiently and most safely, and we think it would be a logical Federal initiative to show that kind of benefit by giving a small-scale increase in matching share.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Thank you very much.

Gentlemen, we certainly appreciate your being here. Any time Les Lamm comes back to this committee it is a pleasant event because for many years Les, of course, has been one of the stalwarts upon whom we have relied very substantially.

For 17 years I was in the electronic computer industry before I lost my mind and ran for Congress, so I am particularly interested in your intelligent vehicle highway system. I wonder, looking into the foreseeable future, roughly what kind of a percentage gain do you think is going to be achieved in congested urban areas? What would we buy ourselves if we had these scopes and screens in our automobiles?

Mr. SMITH. Have you got your crystal ball, Les? Is it all polished up?

Mr. LAMM. Mr. Shuster, thank you for your previous comments. It has always been a pleasure to work with this subcommittee and your very able staff.

My reaction to that comment is that no one knows at this stage. I would go back 15 years to the early 1970s when the Bureau of Public Roads was the world leader in this technology. As a result of a decision that was made in the Congress, in the Appropriation Committee, we lost our leadership. A particular research project that involved applying computer technology to put into motor vehicles was crossed out in the appropriation process. The members felt

that it was just not thinkable that at any time in the future something cumbersome like an electronic computer would be seen in a motor vehicle. Look around today. My own vehicle has at least 27 different functions that are computed on-board now. So technology changes tremendously.

I just use that to indicate it is very tough to estimate. I have seen figures that would show that out of the four or five different major tracks that we are looking at in the way of research for IV/HS technology, just the driver information alone might, over time, provide as much as a 10 percent annual increase or increment in the ability to move around town. That would, in effect, gain us perhaps two years of normal traffic growth.

Mr. SHUSTER. Let me ask then another crystal ball question—equally difficult question. What do you think such a system in a vehicle is going to cost once you are into the mass production and you have got several million vehicles out there with the system in it? What is it going to add to the cost of the car?

Mr. LAMM. That is hard to say, too, because you are dealing with a whole range of research projects, some of which might be available in the next five years, and others might not come on line until the year 2030.

Again, if 20 years ago we tried to predict what the cost of a computer being on board would be, you would say that would never happen. We would never be able to afford it. But technology has brought down the average cost of computers so much that we can now afford it.

In my own estimation, I don't look for anything in the order of even 10 to 15 percent add-on to the cost of a vehicle. Vehicles are being sold right now in other countries around the world—not here, but in other countries—where some of this technology is available as an added extra for individual purchasers. I have heard that people are buying thousands of them in other countries. So it is certainly not beyond the realm of affordability.

Mr. SHUSTER. Thank you very much.

Mr. Smith.

Mr. SMITH. I think one thing to keep in mind, along the same line as Les just responded, we have put computers on cars. We have that capability now. We certainly have communication capabilities on cars. We have radios, more and more there are telephones available, and the price is going down. We know how to have a technology where there is a screen in the car that shows real time action. All of that is available. All of it is coming together so that we can combine functions. I think the competitive marketplace will drive down the price.

So I am very much in agreement with Les that the incremental amount of cost to the car will be substantially less than the advantage that would be there.

Mr. SHUSTER. Thank you very much.

Thank you, Mr. Chairman.

Mr. MINETA. Again, Mr. Smith, thank you very much for your role in leadership with the Federation. And, of course, as Congressman Shuster said, we always welcome the advice and recommendation of Mr. Lamm.

Mr. LAMM. Thank you.

Mr. MINETA. Thank you very, very much for your presence here today.

Mr. SMITH. Thank you.

[Mr. Smith's prepared statement appears on page 405.]

Mr. MINETA. I would like to now call on Mr. Jim Anderson, Chairman of the Infrastructure Task Force, Associated Builders and Contractors.

Mr. Anderson, your statement will be made a part of the record, so please go ahead and summarize and proceed in your own fashion.

TESTIMONY OF JIM ANDERSON, CHAIRMAN, INFRASTRUCTURE TASK FORCE, ASSOCIATED BUILDERS AND CONTRACTORS

Mr. ANDERSON. Thank you very much. My name is Jim Anderson. I am the president of Anderson Brothers Construction Company located in Braynard, Minnesota, working throughout Minnesota and North and South Dakota with our operations.

Being a building contractor and a builder of highways, I can assure you that the funds that you are allocating towards those efforts are getting you a good bargain.

As chairman of the Associated Builders and Contractors' Infrastructure Task Force, I appreciate this opportunity to appear before the Subcommittee on Surface Transportation.

Associated Builders and Contractors, ABC, is a national association of over 18,000 contractors, subcontractors, material suppliers, and related firms from all specialties in the construction industry. On behalf of ABC I commend the chairman for commencing the reauthorization process. ABC shares the subcommittee's commitment to reauthorization of the Federal highway program, and we look forward to working with you to define the post-interstate era.

I have submitted, as you said, my full testimony for the record, but in the interest of your time I will capsulize and just highlight a few points.

As documented by the release of the Administration's national transportation policy, Secretary Skinner stated that the policy document is not the conclusion of the project but the beginning of a new era on an ongoing process. I certainly agree with that.

With the benefits of DOT's efforts and every report preceding it, we must now act to meet the many challenges documented before us.

The deteriorating condition of our public infrastructure is best summarized in the report from the National Council on Public Works Improvements which states, "America's infrastructure is barely adequate to fulfill current requirements, and insufficient to meet the demands of future economic growth and development." The private sector must join all levels of government in an effort to reverse this trend of under-investment.

There is a correlation between infrastructure investment and the nation's economy. Private sector productivity rose and fell in cycles corresponding to rise and falls in investment in highways, bridges, and other public works. This relationship must not be ignored.

Capital improvements to maintain and expand our transportation infrastructure are productive investments. Increasing the effi-

ciency and productivity of public capital investments enables private sector activities to be more productive, and therefore more competitive in the world marketplace.

ABC does not expect the Federal Government to have the financial resources to single-handedly address the nation's transportation needs; however, the benefit of Federal leadership and a forward-looking national blueprint to direct the post-interstate era—these needs can be met through a well-coordinated effort involving all levels of government and the private sector.

Together we must now lay the groundwork required to meet tomorrow's transportation needs. ABC supports direct Federal involvement in roads of national significance. Also, the number of Federal program categories should be reduced and the State and local governments given greater flexibility to set priorities and address their unique transportation needs.

As demands on roads change, localities must have the flexibility to respond. Greater emphasis should be placed on maintenance, resource management, and ways to improve the capacity of the existing facilities.

ABC strongly supports removing the Federal Highway Trust Fund from the unified budget. Also, ABC strongly supports H.R. 41, sponsored by the leadership of this committee, which states that Federal excise taxes on gasoline and diesel fuel shall not be increased to reduce the deficit.

Although ABC supports deficit reduction, we believe deficit reduction can and should be achieved through equitable spending restraints, not by diverting trust fund revenues or by raising dedicated user fees for non-transportation purposes.

Furthermore, the Federal gas tax increase for deficit reduction would undermine the States' ability to raise State revenue for transportation. At a time when States may be asked to absorb a greater share of the cost burden, any move to restrict their ability to address critical needs is bad public policy.

Clean air legislation pending before Congress could adversely impact the future viability of trust fund financing. I urge the leadership of this subcommittee and the full committee to voice objections to any oxygenated fuel programs that mandate the use of ethanol and therefore directly threatens the revenues to the Highway Trust Fund.

Adoption of an aggressive oxygenated fuel program, combined with the current $0.06 cent gasohol exemption—which ABC opposes—will directly undermine the level of user fee revenues reaching the trust fund. In fact, the Federal Highway Administration estimates that implementation of the oxygenated fuel programs contained in the Senate Clean Air Bill, S. 1630, could cost the Highway Trust Fund $1.1 billion annually.

To improve the Federal Government's ability to address our nation's immediate and long-term transportation infrastructure needs, ABC urges the Congress to adopt meaningful Davis-Bacon reform. As endorsed by the Bush Administration and included in the President's fiscal year 1991 budget proposal, true Davis-Bacon reform, which raises the Davis-Bacon threshold to $250,000, would enable highway user revenues to finance additional infrastructure improvements.

According to the Congressional Budget Office, adoption of true Davis-Bacon reform would produce a five-year cumulative saving of $3.5 billion in budget authority.

Before I conclude my remarks I would like to reiterate ABC's commitment to the Federal highway program. Enactment of a responsible and forward-looking reauthorization bill will help to assure that the transportation infrastructure is safe and sufficient to sustain continued economic growth.

On behalf of the Associated Builders and Contractors, I thank the entire Subcommittee on Surface Transportation for the opportunity to appear here today and welcome any questions you may have.

Mr. MINETA. Thank you very much, Mr. Anderson.

ABC has focused a large portion of its financial membership and staff resources on the issue of craft and supervisory training. I am wondering if disadvantages businesses have participated in the training programs offered by ABC?

Mr. ANDERSON. The training programs are available to all DBE or disadvantaged businesses that you allude to. I am not sure of the statistics of how many have participated in those so far. I can get back to you with that information.

Mr. MINETA. I think also if you could include in there, if there has been participation by the disadvantaged business, what ABC's experience has been for improving the competitiveness of those disadvantaged businesses. I would appreciate that.

Mr. ANDERSON. Yes, sir.

[The supplied information follows:]

March 29, 1990

The Honorable Norman Mineta, Chairman
Subcommittee on Surface Transportation
2165 Rayburn House Office Building
Washington, D.C. 20515

Dear Mr. Chairman:

This letter is in response to the question you raised following Jim Anderson's testimony of March 13, 1990, before the Subcommittee on Surface Transportation. As you will recall, in his written statement on behalf of Associated Builders and Contractors (ABC), Mr. Anderson stated that minority set-aside programs were a short-sighted response to a problem requiring a long term solution. As an alternative, ABC endorses managerial and craft training as the appropriate long term investment, to provide disadvantaged firms and their employees with the skills necessary to successfully compete on the basis of merit -- in an open and competitive environment.

Pursuant to your inquiry regarding minority participation in ABC-sponsored training programs, I have been advised that such statistics are not available on a national basis. Although the training materials and curriculum are devised and distributed by ABC's national office, the administration of the individual apprenticeship training programs and task-training modules are handled by either the sponsoring chapter (79) or in many cases, the individual member company.

However, in an attempt to be responsive to your inquiry, I contacted two ABC chapters in California, our Golden Gate and San Diego chapters, and was provided the following information:

ABC Golden Gate Chapter - January - March 1990 training session

Minority Participation - 15.8%

Ethnic Identity	% of Total
Asian/Pacific Islander	2.1%
Black	3.3%
Hispanic	8.8%
Subtotal	14.2%
Women	1.5%
TOTAL	15.8%

729 15th Street, NW • Washington, DC 20005 • (202) 637-8800

ABC San Diego Chapter - State Apprenticeship Council approved, Electrical Apprenticeship program

Minority Participation - 29.8%

Ethnic Identity	% of Total
Black	5.3%
Hispanic	10.6%
Asian	3.2%
American Indian	4.2%
Subtotal	23.4%
Women	6.4%
TOTAL	29.8%

As for the benefits of training to the contractor and the individual employee, ABC believes that free and open competition provides the best opportunity for entrepreneurs and employees to learn the skills necessary to operate their own businesses successfully. The federal government can foster greater growth and participation of minority firms -- in all sectors of the economy -- by offering greater incentives for federal contractors to provide training for their employees. Rather than rewarding mediocrity, the federal government can provide incentives to ensure that opportunities are given to employees of contractors through education and training.

Successful contracting is an evolutionary process in which it takes many years to progress from apprentice to journeyman to supervisor and finally to self-employment. The knowledge, experience and confidence gained are essential when the time comes to embark on establishing a business. Although the government can mandate instant DBE businesses and create environments for their survival on public works projects, the government cannot mandate the ability to compete in the open market against firms with the experience and qualifications previously mentioned.

Set-aside programs may succeed in providing DBE firms with instant work; however, training will provide the skills and expertise required to do quality work, on time and on budget. The latter will better insure the firms' viability and the employees career advancement as a consequence of the training.

Chairman Mineta, I regret not having been able to provide you with a more immediate response to your question. I am enclosing some additional literature regarding ABC's Wheels of Learning program. ABC has truly pioneered task-training and we are confident our members and their employees are well served by our commitment to recruitment and training.

Sincerely,

Charles E. Hawkins III, CAE
Vice President
Government Affairs

EDUCATIONAL & TRAINING RESOURCES

ABC
ASSOCIATED BUILDERS AND CONTRACTORS, INC.

PUBLICATIONS AND VIDEOTAPES

Management Education

- *Construction Supervision Series*: Three competency-based field training manuals
  - ① *Introduction to Supervision*, for craft workers considering the transition to management
  - ② *Project Supervision*, for honing the skills of new and veteran field managers
  - ③ *Project Management*, for improving management skills of both new and veteran project managers
- *Personnel Management: A Guide for Developing an Employee Handbook* (second edition)
- *Mechanical Contractors Business Management Manual*, contains bulletins, sample contracts, business forms
- *Marketing Construction Services*, how-to guide with an executive summary on audio cassette
- *Understanding and Operating a Service Business*, a comprehensive manual for training, management specifics, and reference

Safety Services

- *Hazard Communication*, a compliance kit, includes employee training video, employer audio cassette, manuals
- *Model Safety Program for the Construction Industry — A Basic Approach*, a how-to manual
- *Construction Site Safety Program*, tells how to manage a jobsite safety program
- *Drug Abuse and the Workplace*, instructs employers on detecting and dealing with the problem
- *Implementation of a Substance Abuse Prevention Program: A Manager's Guide*
- *Job Safety Analysis Series*, 24 booklets describing safe use of various tools and tasks on the job-site
- *Tool Box Talks*, an illustrated resource booklet for safety meetings; covers dozens of topics

Craft Training

- The *Wheels of Learning* curricula, a competency-based, task-oriented training program. Approved by the U.S. Dept. of Labor, the *Wheels of Learning* covers 16 construction trades. Available by the complete manual or single task module. Trades covered in the series are:
  - Introduction to Construction
  - Carpentry
  - Drywall
  - Electrical
  - Glazier
  - HVAC
  - Instrumentation
  - Metal Building Assembler
  - Ironworker
  - Masonry
  - Millwright
  - Painting
  - Pipefitter
  - Plumbing
  - Sheet Metal
  - Welding
- *Train the Trainer*, a 10 hour course for new and experienced craft trainers, complete with student and instructor's manuals

Video Tapes

- *People Increase Profits...Building a Cost Effective Construction Team*, a 4 hour teleconference
- *Staying Alive...Profits and Productivity Through Safety*, a 4 hour teleconference
- *Employee Safety Orientation Program*, filmed on construction sites, available in both English and Spanish
- *Hazard Communication Employee Training*, a 25 minute video (part of the complete compliance kit listed under Safety Services)
- *Arbitration of a Construction Dispute*, a step-by-step guide to the arbitration process in the construction industry. 17 minutes.
- *Mediation of a Construction Dispute*, 35 minute video showing how a mediator can bring conflicting parties to a mutually acceptable agreement

PROGRAMS

- *Construction Management Academies*: Developed by ABC in conjunction with Clemson University in South Carolina, the Academies offer three supervisory level, week-long training programs on site at Clemson. Taught by experienced instructors, the academies combine 60-plus hours of classroom lectures, case studies and student participation.
  - Supervisors Academy, an intensive six day school for experienced supervisors
  - Project Managers Academy, an intensive seven day school for experienced project managers
  - Safety Academy, an intensive six day school for safety coordinators and key field technicians

Additional educational and training resources from Associated Builders and Contractors are detailed in the ABC Member Services Catalog. For a *free* catalog contact the ABC National Ordering Department:

MERIT SHOP CONSTRUCTION

LEADING THE WAY

ABC

ASSOCIATED BUILDERS AND CONTRACTORS

ENR SPECIAL ADVERTISING SECTION

OUR COMMITMENT
TO SAFETY IS MORE
THAN JUST A LINE.
At Brown and Root, we do more than talk about safety. It's a responsibility that starts with our CEO and continues down to every employee. And our commitment to a safe workplace has resulted in an unequaled safety record in the maintenance and construction industry. Which means better quality work and higher productivity for our clients. And a pledge to safety that our employees can feel secure about.
Brown&Root, Inc.
And Associated Companies

The construction industry will face a multitude of challenges in the 1990s. Certainly high on its list will be the task of recruiting and training the workforce required to meet the needs of the nation's construction users. Associated Builders and Contractors—ABC—is keenly aware of this challenge and is tacking it like a linebacker meets a halfback head-on.

Recognizing no one group or segment of the industry can solve this problem, ABC and several other major industry organizations are now spearheading the Construction Industry Workforce Foundation, a national coalition of construction associations, business and labor groups. The group's mission is "to provide an adequate supply of qualified workers in the industry." The coalition has joined forces to collectively tackle such issues as image, recruitment, productivity and training.

MERIT SHOP CONSTRUCTION

Leading The Way In Safety, Training and Productivity

ABC, A RECOGNIZED LEADER

ABC, its 78 local chapters, and more than 18,000 members have long recognized the vital need of providing highly skilled labor for the construction industry. In the past 10 years, the association has become a recognized leader in the industry for its achievements in training, safety, management education and productivity. The key to that success has been the willingness of ABC members to commit the time, effort and resources needed to train craftsmen who can provide quality construction at a competitive price. And they are doing just that.

These efforts have not gone unnoticed by the business community. Its own organization, The Business Roundtable, has recognized ABC for its "outstanding contributions to construction industry cost effectiveness." Moreover, the Roundtable named ABC as the first recipient of its prestigious Construction Industry Safety Excellence Award, which is given to the industry association with the most comprehensive and effective safety program.

Again at the forefront, ABC was the first organization in the construction industry to publicly recognize and address drug abuse in the workplace. The association developed and implemented a highly effective program to combat this national crisis—an effort recognized by *ENR* magazine.

MERIT SHOP CONSTRUCTION

Merit shop contractors are, indeed, building America. Recent statistics show that approximately 75 percent of the nation's construction is being built merit shop. The extensive list of clients is a "who's who" of Fortune 500 companies—International Telephone

ABC

TRAINING...

The Metric Way

Learning the right way to build is a way of life at Metric. Whether it's craft skills training, management classes, or on-the-job training, the latest methods are available to employees on all levels.

Metric has set its sights on having the best qualified work force for the 1990's and beyond by setting up programs for productivity and quality training; foreman, superintendent and project manager programs; advanced management training, computer-aided courses; and the training sessions available through the AGC, ABC, and local community technical schools.

If you want your facility built by a trained professional work force, look to the future with Metric.

Metric Constructors

JONES

For information about Metric, Call Dave LaBounty Vice President 704/551-1240

and Telegraph, Mobil Oil, Citicorp Credit Services, Marriott, Dow Chemical, Exxon, Wal-Mart Stores, Union Carbide, Monsanto, Standard Oil, General Electric and many others. And once they build the merit shop way, they come back again and again.

ABC apprentices nationwide are learning the skills necessary to become highly productive workers.

It should be pointed out that merit shop construction is neither open shop nor closed shop. Instead, it represents the best of construction—a unique blend of fine craftsmanship, the most productive management techniques and the most competitive bidding and pricing strategies in the industry. At the heart of the merit shop philosophy is one basic principle—contracts should be awarded on the basis of qualification, performance, capacity and price—regardless of whether a contractor's employees belong to a union or not. Thus, in the merit shop workplace, open shop and closed shop contractors compete as equals in the bidding process. It's a concept that is the cornerstone of the American free enterprise system. It's a concept that works.

CRAFT TRAINING

By the late 1970s, ABC recognized the need for structured training to keep pace with the rapid growth of the merit shop. The association launched an education program unique in craft training: *Wheels of Learning*.

A competency-based, task-oriented, modular training program, *Wheels* can be used in several ways to best suit a contractor's specific needs. It can be taught as a formal apprenticeship program over an extended period at the local level; it is also ideal for self study. Moreover, its practical and flexible "earn as you learn" approach enables contractors to use individual modules for in-house, task-training programs. Or, in cross training, modules may be combined with others from different crafts to provide multiskilled craftsmen. Approved by the U.S. Department of Labor and state training boards, *Wheels of Learning* meets or exceeds all local and national classroom requirements for apprenticeship training programs.

Typically, training in a formal classroom situation takes two to five years. For example, Electrical is taught in nearly 600 hours of instruction over a four-year period. Each year is "packaged" as a separate unit, and a year's curriculum is divided into a series of instructional units called modules. And most importantly, all the material can be adapted to suit each contractor's specific construction needs.

Freeport, Texas, contractor Louis Jones, vice president of Freeport Constructors Inc., has high praise for the program. "*Wheels of Learning* is the best training out there," he says. "Our students move up through the ranks faster and take on responsibility sooner because they're well trained and productive."

That's the key to *Wheels* — productivity — whether it's taught in the classroom or on the jobsite. Students advance according to their abilities and demonstrated skills. Then, actual, productive work is assigned to them when they have successfully completed a level of training.

The entire *Wheels of Learning* program consists of more than 25,000 pages in 114 separate manuals. And at least every five years, each program is revised by leading construction industry experts. The Electrical program, for example, is updated every three years to ensure that training

ABC OF WISCONSIN

WE MAKE TRAINING WORK FOR YOU

Associated Builders & Contractors of Wisconsin, Inc. trains hundreds of construction apprentices, supervisors, and chief executives.

The companies involved in the education programs understand that high quality construction education at all levels is the key to productivity and success. ABC members have the ability to respond to your project requirements with the latest in construction techniques, supervisory skills and management practices.

When your next project demands quality performance backed by training, contact the people committed to building Wisconsin on Merit. Contact a member of Associated Builders & Contractors of Wisconsin!

reflects the most current code changes.

"That's the best part about the *Wheels* program," says Wayne Belanger, education director of ABC's Wisconsin Chapter. "It keeps pace with a rapidly changing technology."

Students at ABC's classroom advance according to their abilities and demonstrated skills.

Because contractors depend on a skilled workforce, Belanger also notes that they "get very involved with training, and that's a real plus." Today in Wisconsin, more than 150 companies are using *Wheels* training programs.

For contractors wanting to boost jobsite productivity immediately, *Wheels* again offers the perfect solution. Because the program is divided into individual skill modules, one task can be learned and mastered — and put to use on the jobsite. The modular concept has proved to be an excellent method of delivering training when new or upgraded skills are needed quickly.

ABC also strongly believes that employee skill, dedication and effort deserve special recognition. Each year, the association sponsors a "Craft Olympics" at its national convention. Follow-

ABC

ing local competitions, the best apprentices in individual crafts from across the country gather to compete on the national level. Not only are individual craftsmen recognized for their outstanding skills, but their local chapters and employers share the spotlight for their dedication to training the best of the best. It's a highly cooperative team effort that fosters pride in craftsmanship and in the merit shop.

USER FUNDING

ABC developed *Wheels of Learning* through private contributions from ABC contractors, the business community and nonprofit foundations. Contributions are increasing significantly from the business community — the users of merit shop construction services.

Take the Gulf Coast region, for example, where between $5 billion and $10 billion of work is expected in the next few years. Contributions to ABC educational programs are made in various ways. Many companies are making a cents-per-man-hour contribution toward craft training for all open shop construction or maintenance work. Since 1980, Dow Chemical alone has contributed almost $1 million to ABC's Texas Gulf Coast Chapter. In Louisiana, ABC's Baton Rouge-Pelican Chapter, assisted by user funding, has trained more than 6000 skilled merit shop craftsmen. Texaco donated a 47-foot tower and an exchanger to ABC's Southeast Chapter of Texas. The chapter's 23,000-square-foot educational facility now houses offices, 20 classrooms, a training shop and a welding school.

ROUNDTABLE LAUDS ABC SAFETY PROGRAM, COST EFFECTIVENESS

The Business Roundtable, an association of 200 chief executive officers of major American corporations, honored ABC as the first recipient of its "Construction Industry Safety Excellence" award. At the presentation ceremony, John Bookout, president and chief executive officer of Shell Oil Co., called the award "a clear signal that owners are very concerned about safety and are determined to see significant safety improvements."

The Roundtable's Safety Excellence Awards Program was established to supplement existing industry safety efforts, encourage reductions in the estimated $6 billion annual cost of jobsite accidents, and make construction a safer occupation.

The presentation award was more than a recognition of past achievement. It was a challenge to further improve the safety and health of present and future construction workers. By accepting the award, ABC accepted the Roundtable's challenge. The award included a $50,000 grant, which ABC is using to develop specific targeted programs to further improve jobsite safety.

Moreover, ABC was recognized nationally for its efforts to improve cost effectiveness. In making the presentation, John F. Rasmussen, chairman of the Construction Industry Cost Effectiveness Project Task Force, said ABC "has diligently promoted the CICE program," and "the overall and specific achievements of ABC represent an outstanding contribution toward a more cost effective construction industry."

ABC's Wheels of Learning is dedicated into individual self-modules, enabling students to quickly learn and master one task.

BE&K is finding our best resources right here ...people like you.

You'll like the way BE&K people work.

That's because we're not only committed to hiring local people skilled in the crafts we need, we go a step further by training our employees to upgrade existing skills and leadership abilities, or teach to learn new skills at no cost to them.

BE&K has developed one of the largest privately funded training programs in the United States. We were among the first to develop on-the-job training programs and to supplement them with formal after hours classes taught by our construction supervisors. Other classes are arranged with local colleges and educational schools.

Through our training, our employees have the opportunity to work at several crafts as the project progresses from one stage to another. That way, they can stay on the job longer.

BE&K employees are provided with better skills for the future. When the project is complete, the local residents we have helped train or advance in skills are a lasting benefit of great value to the community.

On job after job, it's your best doing their best.

And the next time you see a BE&K employee, remember he's not only a valuable asset for us; he's helping make the community a better place.

BE&K

Engineers and Constructors

An Equal Opportunity Employer

Birmingham, AL •Houston, TX •Mobile, AL •Lynn Haven, FL •Raleigh, NC •Portland, OR •Baton Rouge, LA

Construction users such as Dow, Shell Oil Company and Du Pont recognize their responsibility to fund training and regularly donate to the foundation—for the exclusive development of training curricula. In 1988, owners contributed more than $125,000 to the foundation and over $1 million to local chapter training efforts.

Jack Turner, executive vice president of the Merit Shop Foundation, explains that "most contributors are industrial, capital-intensive firms whose interests lie in a strong merit shop industry. Their grants ensure a strong training curricula that emphasizes productivity and quality."

THE MERIT SHOP FOUNDATION

In addition to ABC-sponsored programs such as *Wheels of Learning*, ABC also has a separate educational arm, the Merit Shop Foundation, founded in 1971. Here again, construction users have contributed generously to support the foundation's educational activities, which include:

- craft, management and safety training
- construction research grant programs
- construction education scholarships
- an annual job fair for construction graduates

SAFETY FIRST

In recent years the Bureau of Labor Statistics has reported notable

ABC, BUILDING AMERICA

ABC has grown from 4000 members and 20 chapters in 1970 to 18,000 members and 78 chapters today. Merit shop contractors build approximately 75 percent of all construction put in place each year. Some of ABC's larger members include:

Austin Industries	H B Zachry
Becon	Harbert International
B&SB	Thomas P. Harkins
Blount Construction Group	Hoar Construction
Brown & Root	KCI Constructors
Centex General Construction	Majestic Builders
Donohue	McDevitt & Street
Fluor Daniel	OMNI
James N. Gray	Sigal Const. Corp.
Gulf States	Sundt Corp.

ABC'S CONSTRUCTION BILL OF RIGHTS
Right to free enterprise
The more than 18,000 member firms of Associated Builders & Contractors are strong proponents of the free enterprise system. A system that says to the construction user, you have the right to construction that makes sense economically—free from the inflationary trappings of prearranged labor agreements.
Right to quality
For 40 years ABC has championed the free-enterprise philosophy through merit shop construction. Merit shop represents the finest craftsmanship, most cost-efficient management and competitive bidding strategies in the industry.
Right to choice
The merit shop operates under one basic tenet: a contract award should be made solely on the basis of qualification, performance, capacity and price. The response? The merit shop now builds 75 percent of all construction in the U.S., a large portion of which is repeat business.
Right to growth
ABC has developed the Construction Buyers Service (CBS) to assist construction users in locating contractors for their projects. ABC provides construction users with profiles of contractors—information on volume, bonding ability, manpower availability, performance history and more. Last year CBS matched more than $6.5 billion worth of work between construction users and ABC members.
If you're interested in CBS or any of the other professional services offered by ABC, exercise your rights and give our Business Development Director John Pennullo a call at 202/637-8800. You'll be pleased with the results.
ABC

Excellence begins with training and safety

The quality workmanship and commitment to schedule that are the hallmarks of every Ferguson Construction Company project don't happen by chance. They are the result of our ongoing training and safety program called "Partners in Excellence".

This program benefits you, the customer, because it is designed to personally motivate each individual involved in your project, to encourage an employee's best performance, to emphasize craft training and to eliminate unsafe working conditions.

From our president to the worker pouring concrete, every Ferguson employee is working with you as a partner to accomplish the same end -- a quality project completed on schedule and within budget. It's a commitment to excellence that began back in 1920 and continues into the next decade and beyond.

Students at ABC's academies study computer applications for construction, a key to more productive contracting.

300,000 lost work-day cases annually because of construction industry accidents. In terms of productivity alone, that is a tremendous national loss. ABC and its members know that an integral part of construction training is safety, and are actively working to protect employees on the jobsite.

Summing up ABC's attitude toward safety, Fluor Daniel President and CEO Les McCraw, Jr., recently wrote in the association's monthly magazine: "To be successful, safety must be more than a program or a book of procedures. It must be a company philosophy — an attitude that is unquestioned."

At ABC, the importance of safety is indeed "unquestioned," and the association's commitment is stronger than ever. Assisted by a grant which accompanied the Roundtable's recent safety award to ABC, the association is further enhancing an already comprehensive safety program. To provide its members with a precise method of comparing individual company safety programs with the programs of others within industry segments or regions, ABC developed STEP (Safety Training and Education Process). This self-audit "tool" allows ABC contractors to evaluate, broaden and improve their own corporate safety programs. In addition, ABC has more than 40 safety programs and safety-related products and services. ABC contractors know that safety doesn't cost, it pays!

Teaching case studies is one of many training activities at ABC's "hot-spot" Supervisors and Project Managers academies.

STATE OF THE ART ACADEMIES: HONING MANAGERS' SKILLS

In 1988, ABC and Clemson University founded the "Construction Safety Management Academy," an intense 60-hour training program held on the university's South Carolina campus. ABC and Clemson designed this unique program to sharpen the skills of safety directors and to give safety expertise to supervisors and project managers.

"There's no better place to send safety supervisors for formal training," says Sewell Martin, BE&K vice president of construction operations. "The academy teaches you how to organize an effective safety program. ABC's training is absolutely the best available."

ABC also conducts two other highly successful, state-of-the-art "academies" at Clemson University: the Supervisors and Project Managers academies. These comprehensive 60- to 70-hour programs cover areas crucial to construction management:

- planning and scheduling
- documentation
- safety
- quality and cost control
- computers
- communications
- problem solving
- time management

MERIT SHOP CONSTRUCTION

Hundreds of construction managers from coast to coast have participated in these "top gun" academies, whose stated goal is to make "the best better." The week-long programs foster an exchange of ideas based on years of collective construction know-how.

But this exciting learning experience does not end when the participants leave Clemson! To graduate, each student must put one new idea into actual practice on the jobsite within 90 days. Only after successfully completing that "final exam" do students receive their diplomas.

BE&K's Harlin, who sends employees to all three academies, finds that "the academies have improved our leadership and supervision, and that ultimately affects our bottom line."

Academy instructors are selected through a nationwide search which includes screening by ABC contractors and the Clemson Building Science faculty. All must be skilled educators and motivators, and only those currently working in the field of construction are chosen.

MERIT SHOP CONSTRUCTION

To expand the academy concept even further, ABC and Clemson have set a long-range goal to create a national construction career center for management education. To be housed in permanent facilities, this center will give contractors a unique educational resource that will enhance the management skills of their supervisory personnel far beyond what is now possible.

ABC is also in the forefront of developing management education materials to be used at the local level. The association offers its members a wide variety of training manuals, videotapes, educational seminars and workshops — all specifically geared to increase jobsite productivity. ABC's current management library includes more than 30 manuals addressing topics such as construction supervision, project management, personnel

ABC

Advancing towards perfection

Technology must change with the times. Look around and see what advances have unfolded before your eyes. Not too long ago the abacus helped us cipher numbers. Today, it's a matter of pushing a few buttons.

Gradual, progressive change has its benefits. What we have learned over 30 years has made the ABC Insurance Plan a better group insurance program. Providing the confidence you can count on.

One of the oldest fringe benefits plans designed by contractors for contractors, our new quality age-rated programs are competitive. The evolution we have seen take place offers both you and your employees the savings you expect without sacrificing benefits.

We've even introduced new features such as multi-dependent rates, dual-choice options—HMO or comprehensive coverage—and much more.

Compare your present benefits and rates with the ABC Plan. Maybe your program is out of date. Contact your local chapter office or write us at ABC National. You'll want to keep up with the times.

Build On Our Experience
Office buildings, shopping malls, condominiums, hotels. These are the types of structures that SMC professionals have been building for the past 30 years.

Experience Our Expertise
Every project that SMC undertakes is managed as though it were our only job—whether it be a 15,000 square foot building or a 2,000,000 square foot structure.

Depend On Our Quality
We are large enough to handle virtually any project. We are also small enough to maintain the individual attention and quality service that a demanding client requires.

THERE ARE SOME TOOLS YOU WOULDN'T THINK OF BEING WITHOUT.

Contractors, subcontractors and craftspeople know that a quality project requires quality tools. Associated Builders and Contractors has developed an array of management education, safety and craft training "tools" to help you build quality on-time and on-budget projects. ABC is committed to providing you with the best programs available, to keep you on top of this dynamic and fast-changing industry.

MANAGEMENT EDUCATION

Dramatically increase productivity and profit on your job-site through ABC's management education programs.

- Introduction to Supervision
- Project Supervision
- Project Management
- Formal Task Training Manual
- Reduction of Absenteeism and Turnover
- Developing an Employee Handbook
- Week-Long Clemson Academies
- Mechanical Contractors Business Management Manual
- Marketing Construction Services
- Understanding and Operating a Service Business
- **NEW!** Money Management for Contractors

SAFETY

ABC's safety materials can help you save lives, prevent accidents, and create and maintain a safe and profitable project.

- Hazard Communication Kit
- Safety Program for the Construction Industry
- Week-Long Safety Academy
- Construction Site Safety Program
- Drug Abuse and the Workplace
- Substance Abuse Prevention Program
- Job Safety Analysis Series
- Videos on management education and safety

CRAFT TRAINING

Our successful *Wheels of Learning* program provides exciting comprehensive, task-oriented training in both classroom and practical job-site formats for beginning, intermediate and advanced students.

- Carpentry
- Drywall
- Electrical
- Glazier
- HVAC
- Instrumentation and Control Mechanic
- Introduction to Construction
- Ironworker
- Masonry
- Metal Building Assembler
- Millwright Mechanic
- Painting
- Pipefitter
- Plumbing
- Sheet Metal
- Welding

MERIT SHOP
CONSTRUCTION

Robert L. Turner

National President Robert L. Turner, "and we realize that cost effective, quality construction plays a key role in that effort. We have the answer in merit shop construction and ABC. This association provides contractors with the 'tools' to be the very best. I'm proud of the success of our efforts to ensure a productive workforce.

"Government and private studies agree that the construction industry will be faced with many challenges in the 1990s. ABC and the merit shop are confident that they will be able to deliver the kind of construction America needs and deserves.

"The merit shop construction 'team' can outbid an - and build any competitor, foreign or domestic," says Turner, "and because of ABC's craft, management, and safety training programs, the merit shop will build an even better America in the 1990s."

policy, marketing and many others. To keep members fully informed of these exciting opportunities, the association publishes an annual 90-page catalog of services, publications and programs.

COMMITTED TO THE FUTURE

"American industry needs to remain competitive in the worldwide marketplace," says ABC

For more information on ABC and merit shop construction, write to ABC, 729 15th St. NW, Washington, D.C. 20005, or call (202) 393-1830.

THESE GUYS ARE GOING UNDERGROUND BECAUSE SO MANY PEOPLE IN INDIANAPOLIS NEED GAS.

The artisans of R.L. Turner Corporation continue to break new ground with an impressive addition to Citizen's Gas corporate office. Because as Indianapolis grows, so does the demand for clean, efficient natural gas.

And naturally, Citizen's Gas chose R.L. Turner for his uncompromising approach to general contracting.

On time and on budget.

Equally impressive, each distinct project starts from below the ground up with pre-planning and engineering, followed by the talent, experience, expertise and more important, the attitude.

Call R.L. Turner today at 317 873 2712. And like the gas company, you can soon be in your new digs.

R.L. TURNER

Mr. MINETA. ABC also encourages enactment of a reauthorization bill which is part of a long-term plan with goals extending beyond the authorization period. In the Federal Aid Highway Act of 1956, the long-term goal was completion of the interstate highway system. We are going to be doing that by 1992. What long-term measurable goal would ABC support for the reauthorization of the Federal aid highway program?

Mr. ANDERSON. We would like to see, of course, the trust fund spend down and the elimination of the ethanol exemption to first offer a financing incentive for the program to be initiated.

Then we would like to move on with the program somewhat similar to AASHTO's testimony today. I think there are going to be a lot of current needs studies being done and authorizations being made in certain areas. Once the two criteria I mentioned earlier are addressed, I think we could support an additional increase based on needs.

Mr. MINETA. Do you know how much revenue loss there is for us on that ethanol gas tax situation right now?

Mr. ANDERSON. Currently it is about $500 million a year, and it possibly would be $1.1 billion if the Clean Air Act is enacted.

Mr. MINETA. And if you were to have to convince or to go in and talk to Senator Dole about this, how would you approach this?

Mr. ANDERSON. I think the issue has got some merit to encourage clean fuels, but it unfairly addresses the situation with the Highway Trust Fund being attacked.

Mr. MINETA. I cite as an example that even if it is powered by ethanol, it weighs the same, it takes the same space on the highway as a gasoline-driven vehicle. Somewhere they ought to be paying their fair share. But that, of course, is how I got this scar here. [Laughter.]

It is a tough issue to try and resolve.

Mr. ANDERSON. Yes, it is.

Mr. MINETA. Thank you very much.

Mr. Shuster.

Mr. SHUSTER. No questions. Thank you.

Mr. MINETA. Mr. Cox.

Mr. COX. Just briefly, Mr. Anderson, I have enjoyed very much your testimony and appreciate your being here.

I wonder if, for the record you could expand on that portion of your testimony dealing with Davis-Bacon reform. As you know, we came very close to adopting that in the House earlier, and the President does support it.

You stated that there are two problems with the existing Davis-Bacon system: first, prevailing wages isn't really prevailing wages; second, there are some burdensome requirements in the statute that make it difficult for small businesses to comply and hence to compete.

Could you explain why prevailing wages, which sounds like a reasonable parameter, are not the true, ongoing wages in the locality as originally intended by the statute?

Mr. ANDERSON. Well, I think the original intention of Davis-Bacon is not out of line with our thinking, but the current administration of that law is outdated and it forces a lot of undue expense onto some of these projects which could be done at a much in-

creased savings rate because of the sometimes inaccurate prevailing wage rate determinations and the lack of use of the helper provisions.

I think the Davis-Bacon law and the subsequent prevailing wage rate determinations have been tested in various parts of the country, and ABC has been very involved in those things. We found that there are several contractors that are unable to compete because of the determination of the prevailing wage rates, and also that those prevailing wage rates are sometimes inaccurate and not prevailing in that certain area.

Mr. Cox. What might be a typical spread between the true prevailing rate and the Davis-Bacon rate?

Mr. ANDERSON. I can only testify to those in our area. A $5 to $6 spread would not be out of line in——

Mr. Cox. Per hour?

Mr. ANDERSON. Per hour in any certain craft.

Mr. Cox. And I wonder if you could comment just briefly on the mandated paperwork which you have complained about. What kinds of burdens are particularly difficult for small businesses to comply with?

Mr. ANDERSON. Well, it typically happens that the wage rates need to be reported to the government on these projects, and the small contractor who lives and works in that particular area doesn't get a chance to submit his data. The larger contractors, of course, that have these projects are mandated to submit this data, and also the trade unions are submitting data to those projects on prevailing wage rate projects.

It is an undue burden on the contractor and I think on the government to monitor all of the results, and also some of the inaccuracies that are involved in it are an undue pressure on the government and the contractors who work on these projects.

Mr. Cox. And I take it the thrust of your testimony and the reason that you included it in these hearings is that, through Davis-Bacon reform, we could actually generate more funds for infrastructure improvement by getting more bang for our existing buck?

Mr. ANDERSON. Yes. The total government savings on Davis-Bacon reform, as I had outlined, are $3.5 billion over three years. The portion that is estimated to be attributable to the highway construction part of that is about half of that. Mr. Stenholm is asking for that study to be done currently so we have that figure to work with.

Mr. Cox. Thank you very much.

Mr. ANDERSON. You are welcome.

Mr. MINETA. Mr. Anderson, thank you very, very much for your testimony here today.

Mr. ANDERSON. Thank you for the opportunity.

[Mr. Anderson's prepared statement appears on page 260.]

Mr. MINETA. I would now like to call on Allan V. Johnson, Executive Director and Assistant Secretary-Treasurer of the Ohio Turnpike Commission and the Immediate Past President of the International Bridge, Tunnel and Turnpike Association.

Mr. Johnson, we are pleased to have you here. Your statement will be made a part of the official records. Go ahead and proceed in

your own fashion. Please also introduce your colleagues with you, sir.

TESTIMONY OF ALLAN V. JOHNSON, EXECUTIVE DIRECTOR AND ASSISTANT SECRETARY-TREASURER, OHIO TURNPIKE COMMISSION, AND IMMEDIATE PAST PRESIDENT, INTERNATIONAL BRIDGE, TUNNEL AND TURNPIKE ASSOCIATION, ACCOMPANIED BY NEIL SCHUSTER, EXECUTIVE DIRECTOR, AND ARTHUR BERG, CHAIRMAN, LAW COMMITTEE AND CHIEF, OPINIONS AND APPEALS DIVISION, THE PORT AUTHORITY OF NEW YORK AND NEW JERSEY

Mr. JOHNSON. Thank you, Mr. Chairman and members of the subcommittee. I am accompanied by Neil Schuster, who is the Executive Director of the International Bridge, Tunnel and Turnpike Association, and Arthur Berg, who is chairman of the Law Committee of the Association.

Mr. Chairman, as you said, my name is Allan Johnson and I am the Executive Director of the Ohio Turnpike Commission and Immediate Past President of the International Bridge, Tunnel and Turnpike Association, and I am appearing here today in that capacity.

Mr. Chairman and Members, I realize that you have been on a long, non-stop day here already. I know we are last here, and I don't want to be remembered as the one that overstayed our welcome. I have been busy trying to condense the formal statement that you have, which I hope I can present to you in a brief and short fashion.

IBTTA is the worldwide association representing the toll industry, with members in 20 countries on 5 continents. In the United States, alone, the Association represents 47 agencies which operate 135 toll facilities in 28 States. There are almost 5,000 miles of toll roads, bridges, and tunnels in the United States, about half of which are on the interstate highway system, and over three billion vehicles travelled the U.S. toll facilities in 1988.

The Association supports and promotes the use of toll financing as an effective alternative or supplement to tax financing of the design, construction, operation, and maintenance of transportation facilities wherever it is practical, feasible, and prudent.

We are witnessing a renewed interest in toll financing throughout the world, and the United States is no exception. We believe that Federal policy should encourage the use of alternative public and private funding mechanisms—especially tolls—whenever State and local governments find them appropriate.

The time for this is right because the conditions are right. A growing number of lawmakers and planners at every level of government and the motoring public throughout the country realize that toll financing represents a successful, well-tested means to raise revenues to build and operate vitally-needed roads, bridges, and tunnels.

Toll financing offers travellers many well-documented benefits. Because of their dedicated source of revenues, toll facilities are extremely well maintained, which translates directly into reduced vehicle operating costs. Toll roads are well patrolled, and they are

safe. The safety record of the toll facilities is second to none in this country. And toll financing allows construction to take place in a substantially shorter time frame. That results in lower overall construction costs and transportation facilities that are available many years sooner than otherwise might be possible.

Toll projects face a very strict market test so that only projects which are economically and financially sound and which serve the needs of the motorists will move forward. Costs, traffic demand, and other factors must be well documented before a proposed project will receive funding in a private, competitive financial market, and, as a result, existing toll projects have an enviable record of success. In fact, traffic projections generally are on the conservative side, and in almost every case traffic on new toll facilities has grown substantially faster than anticipated.

The Administration's program, which has been outlined here before, advocates using technology—and which you heard earlier today, technology such as smart cars—to improve the efficiency of highways. Toll agencies already are developing innovations to serve their patrons. One excellent example of this is the widespread development, testing, and use of technology to allow non-stop electronic collection of tolls. These automatic vehicle identification systems, otherwise known as AVI, can drastically reduce the time necessary to process vehicles at toll collection points. The result will be less congestion, faster passage of vehicles through toll plazas, and lower toll collection costs.

Everyone seems and appears committed to the continuation of user fees, which include both taxes and tolls as the way to meet transportation needs. There also is a consensus that a mix of financing sources will be needed to build and operate our highways in the future.

In 1987 the Congress took a big step forward toward modifying its longstanding opposition to tolls when it endorsed a limited program of Federal assistance to toll financing in nine States as a demonstration program. Although it is still in its early stages, the program is moving steadily forward and a number of other States have expressed interest in joining this program.

It is worth noting that several States that are now participating in the program did not have existing toll roads. This, to us, indicates a recognition that convention tax funding was not going to provide enough money to build the roads needed in those States, and it also demonstrated a willingness to change direction on toll policy to get the job done.

As you know, the Federal contribution to the pilot toll projects is limited to 35 percent of project costs. It may be too early to tell if this is a proper or practical ratio of Federal to State and local dollars, and time and experience will give us all better guidance in these areas as these projects develop.

Federal legislation mirrors some of the State initiatives. There is landmark legislation implementing tolls that has come about in California and Virginia, and it will likely be enacted in other States, as well.

We believe that each State should have the flexibility to combine Federal funds and toll revenues in meeting their transportation needs on any facility it wishes to build or improve. Our highway

program should encourage rather than discourage States to examine and adopt innovative financing schemes, including toll financing and public/private partnerships.

It also follows that all toll agencies—such as my agency, the Ohio Turnpike Commission—should be freed from section 129 tripartite agreements which were signed many years ago based on the original Interstate Act passed in 1956—those agreements between the agencies or among the agencies—the Federal Highway Administration and the State Departments of Transportation—that affects those toll roads that have been incorporated into the interstate system. These agreements call for removal of tolls when original bonds or other financial obligations are paid, and at least seven States have already been released from those agreements. Our State, Ohio, has a bill in your committee, Mr. Chairman, H.R. 1419, which would allow that agreement to be abolished, and this committee has indicated it wishes to incorporate that into this overall transportation bill and we urge that that be done.

These agreements ignore the fact that these roads, which were built many years ago, and despite the constant maintenance that has been put into them, still are often in need of substantial reconstruction and upgrading which, if they became toll-free, will have to be paid for with tax funds. And so we believe that it is inconsistent for the Federal Government to foster toll road construction, on the one hand, but then to deny that option to the State at some future date. We believe this also applies to those States which have signed agreements to obtain funds for their interstate toll road mileage.

The decision to continue or discontinue tolls on a facility should be made by each State based on its own economic and political situation and its then-current surface transportation needs, goals, and available funding.

Another restriction, the requirement that all Federal aid funds must be repaid before tolls may be imposed on a section of Federal aid highway, also is inconsistent with changing Federal policy and should be reexamined.

In conclusion, Mr. Chairman and members of the subcommittee, we respectfully request the committee to remove Federal restrictions to the application of innovative toll financing and provide relief from existing so-called tripartite agreements that were entered into many years ago. We think these goals are fully compatible with and should be an integral part of a national transportation policy for future highway programs in this country.

Again, Mr. Chairman and members, we thank you for the opportunity to present our views. I would like to say to the Honorable Shuster that his State, Pennsylvania, with the Pennsylvania Turnpike being the grandfather of the morden toll roads in this country, will be celebrating the 50th anniversary of that facility later this year. We applaud that and are looking forward to participating in that commemorative event.

With that, Mr. Chairman, we will be happy to try to answer questions.

Mr. MINETA. Very good. Thank you very much, Mr. Johnson.

The Administration recently announced, as you are all very well aware, the national transportation plan, which recognizes the need

for greater private sector involvement and funding for transportation facilities. Toll financing and bonding for the construction of transportation facilities are available to States under the existing highway program. What incentive is there for the States to use Federal funds in the construction of toll facilities?

Mr. JOHNSON. Mr. Chairman and members, I think that the incentive—especially in the pilot projects that are already authorized—is that in many cases a single source of funding, either tax or toll revenues, alone, would not allow these projects to be feasible. And so, in the case of the existing nine pilot projects, I think that the 35 percent proposed Federal contribution is going to make those projects feasible; otherwise, if it were financed solely with toll revenues, the toll rates might have to be too high.

Mr. MINETA. If States are permitted to use Federal funds for the construction of toll facilities, should motorists have the choice of using a toll facility on an alternative tax-supported road located in the same transportation corridor?

Mr. JOHNSON. Mr. Chairman, that usually is the case on almost all facilities. There generally is a choice. I, of course, am most familiar with my situation in the State of Ohio where the Ohio Turnpike is the interstate road—Interstates 80 and 90 across the Northern part of the State. While I would agree that there are no comparable free interstate roads in that corridor, there are usually many other parallel corridors that, because that turnpike and toll road is there, those parallel facilities are less congested and do offer an alternative.

It probably is good to be able to always offer an alternative, but there are some cases—such as bridges and tunnels, perhaps—where there would be no alternative.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. We appreciate your being here today, gentlemen.

You mentioned that some toll roads are exempt from having to lift tolls when the bonds are retired. Would you have a list of which ones they are?

Mr. JOHNSON. I am talking, Mr. Chairman and Mr. Shuster, about those States that originally had these 129 tripartite agreements. I say Ohio has one that was entered into in 1964 and it is still on the books. We are asking for relief from that.

As far as I know, the other States that had those that have already been released are Maine, Indiana, Virginia, West Virginia, Maryland, Kansas, and a facility in New York, the New York Bridge Authority, I believe. So there are at least seven States that have already been released from those, and it may well be that Ohio is the only one left that has one.

Mr. SHUSTER. I don't have any recollection of our doing that. That must have occurred many years ago that they were released. Or is that recently? Did we do that in our legislation here?

Mr. JOHNSON. Mr. Chairman and Mr. Shuster, the most recent release occurred in the 1987 Surface Transportation Act, and that was the one that affected West Virginia and Maryland, Kansas and the New York facility.

I might say, Mr. Chairman, that in so doing West Virginia was forgiven the interstate funds that were used to finance the parallel lanes——

Mr. SHUSTER. I do recall the West Virginia situation.

Mr. JOHNSON [continuing]. Where they were forgiven at least a $650 million Federal contribution. And Maryland was for the Fort McHenry Tunnel.

Mr. SHUSTER. Yes. There was not a road in Maryland.

Mr. JOHNSON. No. It was the Fort McHenry Tunnel.

Mr. SHUSTER. The Fort McHenry Tunnel. Right. Okay. Thank you very much.

Mr. JOHNSON. Thank you.

Mr. MINETA. Mr. Cox.

Mr. COX. Mr. Johnson, I am very interested in your testimony because I come from Orange County where we have got a number of the tolls roads that you mentioned on the books.

I think that the chairman's question is an interesting one because it gets at the notion that, try as we might, when we permit the construction of toll roads we are, in part, extending a quasi-government monopoly, and so we need to worry about the degree to which either private entities or quasi-public entities are taxing people and distributing what is a public good in a certain sense.

Your testimony specifically was to the effect that the Federal Government shouldn't in any way be involved with the decision to continue to collect tolls after the roads are paid for—that that should be totally a local option. While I might be prepared to accept that, how do I allay the concerns that I just alluded to?

Mr. JOHNSON. Well, Mr. Chairman and Mr. Cox, first of all, if you assume that the road is totally paid for, then perhaps there would be no reason to continue a toll. But the practical matter is that nothing is ever paid for.

Mr. COX. We've got maintenance to worry about.

Mr. JOHNSON. You have got to worry about continuing maintenance.

What we are talking about here is continuing the tolls after maybe the bonds that might be sold to finance these facilities are paid off. That is generally the key and the trigger on these agreements that have been entered into so far.

Certainly there must be some control over that. You certainly couldn't turn over the operation of what is truly a public-used facility to a private, non-responsive authority or agency that could just charge any tolls. There has got to be some mechanism—I would agree—that you have to have some control.

Mr. COX. I am not sure that I was advancing that proposition in my question. I was just teeing it up for you to respond to. If that is your view, that is fine. I'm not sure it is mine.

Mr. JOHNSON. If I just might expand on this a little further, as Mr. Schuster was just telling me that it has been authorized in Virginia, and perhaps he can explain more. But there is some sort of an oversight responsibility or agency in that that must have some say on tolls.

Mr. SCHUSTER. Very quickly, the Dulles Toll Road Extension will be—there will be oversight by the State Corporation Commission in Virginia which oversees utility rates, and they will ensure that the toll rate is adequate to give the private investor an adequate rate of return and also protect the motorist and the State in providing a road at a reasonable price, so there will be that oversight.

Mr. Cox. But if I understand the thrust of your testimony, it is that, to the extent possible, the Federal Government should stay out of that process and it should be a local determination or a State determination?

Mr. JOHNSON. Mr. Chairman and Mr. Cox, I think you are probably going to have to look at each one of these individually. Again, I might just relate to the situation as it applies to Ohio, where there is a Federal cloud hanging over us and a Federal agreement. There has never been one cent of Federal money spent on the Ohio Turnpike, and yet, because of this agreement, there is a prohibition about continuing tolls, which is what we are saying ought to be left up to the situation in the State because it is going to be the State that will have to be responsible for the ongoing operation and maintenance of that facility if, in fact, it goes toll free.

Each one of these I think would have to be looked at individually.

Mr. Cox. The portion of your testimony that caught my eye was that which said the decision to continue or discontinue tolls on a facility should be made by each State based on its own economic and political situation. Is that consistent with your answer? You are saying that it varies situation by situation, but it is the State and not the Federal Government that should make that decision? Who should make the decision?

Mr. JOHNSON. Well, Mr. Chairman and Mr. Cox, I would certainly think that if the Federal Government had some role in the financing—which is likely the case here—that certainly they ought to have something to say in the ultimate determination. But, again, if it is a situation where the State and the authority, such as the Ohio Turnpike Commission, which is the one that did the financing and the operation, and that the State then would be the agency responsible for taking over the facility after the tolls are taken off, there ought to be a decision made on the State level rather than on the Federal.

Mr. MINETA. Would my colleague yield on that point?

Mr. COX. By all means.

Mr. MINETA. But the problem—I wonder, Mr. Johnson, let's say you have a toll road that is 200 miles and you have got interchanges in the length of that 200-mile toll road, and those interchanges are Federally financed so that you have ingress and egress off of an onto the toll road, and those other interchanges are all Federal financed. Isn't that the connection that we have right now?

Mr. JOHNSON. Mr. Chairman, that is the situation in Ohio. That was the reason for entering into this tripartite agreement—because of the interstate crossings of the road.

As I said earlier, there have never been any Federal funds spent on the——

Mr. MINETA. Toll road. Yes.

Mr. JOHNSON [continuing]. Turnpike, itself. It is on some of the approaches. And even there there is a finite point where the Federal funding stops. It is right at the point where you get to the toll plaza. It doesn't finance anything from the toll plaza on down.

So the Federal funding—in our case, it is a very minor amount of funds—not if it were in my pocket—of about $7 million.

Again, the restriction that tolls have to come off the whole 241-mile road because there were four interstate roads that crossed it doesn't seem to make sense.

Mr. MINETA. I thank my colleague.

Mr. COX. Can you envision a situation in which the toll road was 100 percent privately financed and, as a consequence, no Federal dollars were directly involved in its construction, where the toll agency would make the decision about at what rate to set the tolls and when they should expire without the Federal Government or the State Government being involved?

Mr. JOHNSON. Mr. Chairman and Mr. Cox, there may be such a situation. I don't think it would be a very good situation, personally. I think there has got to be some control on that because you are right: these are facilities, even though they might be privately-built and privately-financed, that are going to be used by the public.

Mr. COX. Mr. Schuster, would your commission approach get at this problem?

Mr. SCHUSTER. I think in any case you are going to have a facility which is part of a larger network—a State network, a regional network—and I don't foresee the State relinquishing it entirely from that process.

Mr. COX. And would the kind of commission that you described be an answer then?

Mr. SCHUSTER. Yes, I think so, particularly in Virginia. And I think other States would follow a similar course of action.

Mr. COX. Thank you very much.

Mr. MINETA. Let me ask one final question here, Mr. Johnson.

Under the 1987 law that we are under right now the Federal share is limited to 35 percent of the project cost. Would you envision changing that? Would you support any change in that 35 percent limitation right now?

Mr. JOHNSON. Mr. Chairman, I am not really prepared to answer that. I don't really know how the 35 percent was developed in the first place personally, and I personally don't have any recommendation on whether that should change or not.

Mr. MINETA. Maybe you could give some thought to that and respond to it. I would appreciate that.

Mr. JOHNSON. We would be very happy to, sir.

Mr. MINETA. Very well.

[Mr. Johnson's response follows:]

The Honorable Norman Y. Mineta
Chairman, Subcommittee on
Surface Transportation
House Public Works and
Transportation Committee
Washington, D.C. 20515

Dear Mr. Chairman:

I am writing to provide information you requested during our Association's testimony before your Subcommittee on March 13.

Federal Participation
In Future Toll Projects

IBTTA does not have, at this time, a specific recommendation regarding the federal share in future federal-aid toll projects.

However, we do support giving states and local governments as much encouragement and flexibility as possible to use innovative financing mechanisms, including tolls, to meet their future transportation needs. A higher level of federal participation in federal-aid toll projects may serve this purpose.

Continued experience under the federal toll pilot program will indicate whether the current 35 percent federal share is appropriate or whether some modification will be helpful.

Public Oversight of Toll Projects

Experience with public and private toll financing in the United States and in other countries indicates that there is adequate public control and oversight over toll projects, whether operated by public or private entities.

Toll authorities are governed by boards or commissions whose members are usually appointed by the state governor or other elected officials. They are therefore subject to state political control, and it is impossible for a toll agency to take any major action, such as raising tolls, without the support of public officials.

This is also true for private toll facilities. Toll rates on the private Dulles Toll Road extension, for example, will be regulated by the state agency which oversees utility rates.

In addition to their responsibility to elected officials, toll agencies are responsive to public opinion. Most agencies give advance public notice of toll increases, and conduct traffic, environmental and economic impact studies prior to modifying toll rates.

The public has direct access to the judicial process with respect to toll rates. Motorists are free to seek direct judicial review of toll increases under the Commerce Clause of the Constitution, on the theory that increased tolls are an impermissible burden on interstate commerce. Toll rates are also subject to review by state courts.

Further limits on private toll projects insure that these projects serve the public good. In many countries, private developers are granted a concession to build and operate specific facilities, and to collect tolls for a specific number of years. Private projects under study and development in the United States will most likely use this same mechanism.

The concession system provides for adequate toll revenues to cover construction, operation, maintenance and debt retirement of the project. At the end of the concession period, the project is usually returned to the state or local government.

Competitive capital markets provide an additional safeguard for both public and private toll projects. New toll projects must be based on sound financial and economic analyses.

Thank you for the opportunity to provide the Subcommittee with additional information on toll financing. We will be pleased to provide any additional information you might need in the months ahead.

Very truly yours,

Neil D. Schuster
Executive Director

NDS/s

Mr. MINETA. Well, thank you very, very much for your patience in sticking it out this long in terms of your work with the IBTTA. Again, thank you very much, Mr. Berg, Mr. Schuster, and Mr. Johnson.

Mr. JOHNSON. Thank you.

[Mr. Johnson's prepared statement appears on page 328.]

Mr. MINETA. There being no further business of the subcommittee, we stand adjourned until Thursday at 10:00 a.m. on the 15th.

[Whereupon, at 3:54 p.m., the subcommittee was adjourned, scheduled to reconvene at 10:00 a.m. on Thursday, March 15, 1990.]

PREPARED STATEMENTS OF WITNESSES

ABC
ASSOCIATED BUILDERS AND CONTRACTORS, INC.

Statement of Associated Builders and Contractors

Presented by Jim Anderson, President

Anderson Brothers, Co.

before the Public Works and Transportation

Subcommittee on Surface Transportation

March 13, 1990

Speaking for the Merit Shop

729 15th Street, N.W.
Washington, D.C. 20005
(202) 637-8800

My name is Jim Anderson and I am President of Anderson Brothers Co., a highway contractor located in Brainerd, Minnesota, with operations throughout Minnesota, North and South Dakota. As the Chairman of Associated Builders and Contractors' Infrastructure Task Force, I appreciate this opportunity to appear before the Subcommittee on Surface Transportation.

Associated Builders and Contractors (ABC) is a national association of over 18,000 contractors, subcontractors, material suppliers and related firms, from all specialties in the construction industry. Our diverse membership is bound by a shared commitment to merit shop construction. The merit shop philosophy of awarding construction contracts to the lowest responsible bidder, regardless of labor affiliation, through open and competitive bidding, assures taxpayers and consumers of receiving the most value for their construction dollar. With 75 per cent of construction today done by merit shop contractors, ABC is proud to represent this growing sector of the construction industry.

On behalf of ABC, I commend the Chairman for commencing the reauthorization process. ABC shares the Subcommittee's commitment to reauthorization of the Federal-aid Highway program and we look forward to working with you to define the "Post-Interstate Era".

As demonstrated by the release of the Administration's national transportation policy, new ideas, no matter how controversial, help initiate this important policy debate. Secretary Skinner stated that the policy document "is not the conclusion of project, but the beginning of a new era and an ongoing process." I agree. With the benefit of DOT's efforts and every report preceding it, we must now act to meet the many challenges documented before us.

The deteriorating condition of our public infrastructure is best summarized in a report from the National Council on Public Works Improvement which states, "...America's infrastructure is barely adequate to fulfill current requirements and insufficient to meet the demands of future economic growth and development." The private sector must join all levels of government in an effort to reverse this trend of under investment.

Admittedly, ABC members benefit from increased investment in infrastructure construction and maintenance; however, the benefits of this investment extend well beyond the immediate boon to construction. To again quote Secretary Skinner, "an investment in transportation is an investment in our future economy, in jobs".

As documented by David Aschauer, Chief Economist with Federal Reserve Bank of Chicago, there is a correlation between infrastructure investment and the nation's economy: private sector productivity rose and fell in cycles corresponding to rise and falls in investment in highways, bridges and other public works. This relationship must not be ignored. Capital improvements to maintain and expand our transportation infrastructure are productive investments. Increasing the efficiency and productivity of public capital investments enables private sector activities to be more productive and therefore, more competitive in the world marketplace.

ABC does not expect the federal government to have the financial resources to single-handedly address the nation's transportation needs; however, with the benefit of federal leadership and a forward looking national blueprint to direct the post-interstate era, these needs can be met through a well coordinated effort involving all levels of government and the private sector. Together we must now lay the groundwork required to meet tomorrow's transportation needs.

Federal Government's Role

The federal government should maintain it's commitment to transportation and the Federal-aid highway system in particular. Economic development and global competitiveness, which require a safe, reliable and cost-effective transportation network, are national concerns requiring continued coordination, planning and investment at the federal level.

ABC encourages enactment of a reauthorization bill which is part of a long term plan -- with goals extending beyond the 4 year reauthorization cycle. The reauthorization bill should encourage innovation and new technologies, including smart cars and high-tech highways. We need to examine whether the traditional modes of transportation will be sufficient to meet the demands of tomorrow. Are more lanes the answer? How can we improve coordination between modes and increase ridership on public transportation? What transportation demand managements strategies should employers be implementing to reduce congestion?

ABC supports direct federal involvement in roads of "national significance". We support minimum allocation provisions to insure that states receive at least 85 per cent of the money they send to Washington in the form of gas taxes. The number of federal program categories should be reduced, and state and local governments given greater flexibility to set priorities and address their unique transportation needs. As demands on roads change, localities must have the flexibility to respond. Greater emphasis should be placed on maintenance, resource management and ways to improve the capacity of existing facilities. Allowing the construction of private roads and toll roads will also help stretch limited public dollars farther. Public-private partnerships should be encouraged where appropriate and sustainable. ABC encourages Congress to reserve the designation of "demonstration project" for projects that are innovative, providing valuable information for replication elsewhere.

Financing

Since 1956, motor fuel taxes have been the primary user fee collected to finance the Highway Trust Fund. ABC strongly supports removing the federal Highway Trust Fund from the unified budget in order to prohibit the diversion of dedicated transportation revenues to non-dedicated purposes and to remove these self-financed expenditures from the annual appropriations process and arbitrary obligation ceilings. ABC supports exploring alternative and innovative financing mechanisms; however, these new revenues sources should compliment, and not replace, Trust Fund expenditures.

ABC firmly believes that revenues raised by user fees and collected in transportation trust funds should be allocated and spent solely for their intended purposes. ABC opposes the current practice of holding money in the trust fund to mask the size of the federal deficit. These balances must be drawn down. In the absence of enforceable language to insure that user fee revenues will be spent on dedicated purposes and not diverted to the general fund, ABC cannot support a gas tax increase. ABC agrees that needs exceed current expenditure levels; however, annual expenditures on transportation can be increased without raising the user fees above current levels.

ABC strongly supports H.Res. 41, sponsored by the leadership of this Committee, which states that federal excise taxes on gasoline and diesel fuel shall not be increased to reduce the deficit. Although ABC supports deficit reduction, we believe deficit reduction can and should be achieved through equitable spending restraints, not by diverting trust fund revenues or by raising dedicated user fees for non-transportation purposes.

Furthermore, a federal gas tax increase for deficit reduction would undermine the states' ability to raise state revenue for transportation. At a time when states may have to absorb a greater share of the cost burden, any move to restrict their ability to address critical needs is bad public policy.

ABC will oppose any proposal that undermines the user supported Trust Fund and violates the trust struck between Congress and the American people.

Clean Air

Clean Air legislation pending before Congress could adversely impact the future viability of Trust Fund financing. ABC applauds the Public Works Subcommittee on Investigations and Oversight for holding a hearing to review this very important issue. I urge the leadership of this Subcommittee and the Full Committee to voice objections to any oxygenated fuels program that mandates the use of ethanol and therefore, directly threatens revenues to the Highway Trust Fund.

Adoption of an aggressive oxygenated fuels program combined with the current six cent gasohol exemption, which ABC opposes, will directly undermine the level of user fee revenues reaching the Trust Fund. In fact, the Federal Highway Administration estimates that implementation of the oxygenated fuels program contained in the Senate clean air bill., S. 1630, would cost the Highway Trust Fund $1.1 billion dollars annually. As you well know, increased usage of "clean" vehicles will not remedy the wear and tear on roads, highways and bridges or reduce the need for mass transit.

ABC is pursuing adoption of oxygenated fuels programs which allow for the use of non-exempt blends, such as ETBE (Ethyl Tertiary Butyl Ether) and MTBE (Methyl Tertiary Butyl Ether), since they provide air quality benefits similar to a program requiring ethanol, without crippling the Highway Trust Fund. ABC is simply asking that all vehicles pay their fair share. The cost of implementing an oxygenated fuels program need not be borne by the Highway Trust Fund.

ABC encourages the use of transportation demand management strategies and enhanced coordination between modes to achieve improvements in air quality. However, transportation policy should remain under the direction of the Department of Transportation and not be relinquished to the Environmental Protection Agency. Furthermore, the ability to finance environmentally beneficial infrastructure improvements will again depend on the level of funds available in the Highway Trust Fund.

Similarly, the imposition of anti-growth sanctions, such as withholding federal highway funds, may well prove counterproductive to the goal of improved air quality. Although ABC supports clean air legislation, we believe it is unwise to sacrifice our ability to finance critical transportation needs -- doing so would only increase congestion and gridlock, waste valuable energy resources and further exacerbate the urban non-attainment problem.

Competitive Bidding

ABC is founded on the philosophy that construction contracts should be awarded on the basis of merit. Contractors offering the lowest responsible bid should be awarded the contract regardless of labor affiliation. Not only does this practice assure the consumer and the taxpayer of the best value for their construction dollar, it also removes inequities from the bidding process.

Let me assure you that ABC members do compete for and win contracts awarded on the basis of expertise and experience; however, we believe such bidding practices should only be exercised when warranted due to the sensitivity of a specific project.

Since the Federal Highway Administration (FHWA) currently has available to it means to screen contractors on the basis of past performance, ABC does not see the benefit of the new innovative bidding program being implemented by FHWA. The competitive bidding process is the best means to award contracts. Any intrusion of subjectivity only promotes inequities and runs the risk of inflating the cost of public construction.

Disadvantaged Business Enterprise Program (DBE)

Similarly, the imposition of Section 105(f) of the 1982 Surface Transportation Assistance Act, which requires 10 percent minority business participation on Federal-aid highway contracts, inhibits the competitive bidding process without better equipping disadvantaged firms to compete in the absence of preferential treatment.

ABC has found DBE programs to be a short-sighted response to a problem requiring long-term solutions. Set-asides insulate disadvantaged firms, preserving rather than improving their situation. Training, on the other hand, would improve the craft and management skills of the disadvantaged firms and their employees.

Since highway work does not lend well to subcontracting, the DBE set-aside requirement essentially forces many contractors to award the majority of their subcontracts

to DBE firms -- effectively banning non-minority subcontractors from the competition. The shortage of DBE firms also bumps up the cost of public construction, since in the absence of competition, DBE firms are unlikely to be low bidders.

Rather than pursuing set-asides, ABC urges DOT to join with the private sector to provide training, enabling disadvantaged businesses to compete and win contracts on merit rather than due to a federal set-aside program. ABC has focused a large portion of its financial, membership and staff resources on the issue of craft and supervisory training. We have long recognized that if the United States is to foster expanded opportunities for all its citizens and maintain our competitiveness, hundreds of thousands of additional highly skilled workers will be needed between now and the year 2000. Training is the only solution.

Since the DBE requirement will most likely be retained, ABC encourages the inclusion of safeguards (i.e. a sunset provision, size restrictions for eligibility and limits on the number of contracts a DBE can obtain through the program) to insure that the requirement does not perpetuate the firms' DBE status.

Davis-Bacon

To improve the federal government's ability to address our nation's immediate and long term transportation infrastructure needs, ABC urges the Congress to adopt meaningful Davis-Bacon reform. As endorsed by the Bush Administration and included in the President's FY '91 budget proposal, true Davis-Bacon reform, which raises the Davis-Bacon threshold to $250,000, reduces paperwork requirements and allows unrestricted use of helpers, would enable highway user revenues to finance additional infrastructure improvements.

Administration of the Act has resulted in the determination of "prevailing wages" which are NOT the true ongoing wages in the locality as originally intended by the legislation. Davis-Bacon requirements inflate the cost of federal construction by requiring the payment of artificially high wages. The Act prevents small firms from entering the public works bid arena since the smaller businesses simply cannot compete with the ability of larger firms to comply with the requirements of the statute, and the associated paperwork requirements. The mandated paperwork alone is not economically feasible for a small business.

According to the Congressional Budget Office, adoption of true Davis-Bacon reform would produce a five year cumulative savings of $3.5 billion in budget authority. Of the government wide savings, approximately 50 percent would be realized from savings on federal transportation and highway programs. ABC believes those dollars could be better spent addressing additional needs, rather than being lost to artificially inflated wages.

Before I conclude my remarks, I would like to reiterate ABC's commitment to the Federal-aid Highway Program. Enactment of a responsible and forward looking reauthorization bill will help to insure that our transportation infrastructure is safe and sufficient to sustain continued economic growth.

Again, on behalf of Associated Builders and Contractors, I thank the entire Subcommittee on Surface Transportation for the opportunity to appear here today and I welcome any questions.

STATEMENT BEFORE

THE SURFACE TRANSPORTATION SUBCOMMITTEE

OF THE

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

Relating to

SURFACE TRANSPORTATION REAUTHORIZATION LEGISLATION:

VIEWS OF WESTERN RURAL STATES

By:

RICHARD J. BACKES
Commissioner/Director
North Dakota Department of Transportation

MARCH 13, 1990

Mr. Chairman, Members of the Subcommittee, I am Richard Backes, Commissioner/Director of the North Dakota Department of Transportation. North Dakota sincerely appreciates this opportunity to present its views on the reauthorization of the Federal-Aid Highway Program. I will focus my comments on issues of concern to the rural western states.

GENERAL POSITION: WE SUPPORT EVOLUTION NOT REVOLUTION IN THE FEDERAL HIGHWAY PROGRAM

Mr. Chairman, the Federal-aid highway program has been one of the most successful, long-running, cooperative partnerships ever undertaken by federal and state governments. The process has developed the safest, most efficient, highway system in the world. It is a program that has worked well.

Yet, we have heard some suggest that with "completion" of the Interstate System, there should be major changes in the program. We disagree.

North Dakota and many rural western states are concerned that, if implemented, some proposals we have seen would have a negative impact on their funding and ability to preserve the federal-aid system. Therefore, the rural western states strongly support continuing the basic structure of today's federal-aid highway program. With only minor modifications, the existing program will continue to provide our nation with the best surface transportation system in the world.

In addition, while we in North Dakota, and other rural states, receive virtually no transit money, we do not seek to reduce transit funding. We do not plan to object to continuing to dedicate a penny (but no more) of the federal fuel tax to transit. Further, we do not object to continuing a Federal-aid transit program financed out of the General Fund of the Treasury.

There are basically two "changes" to the program which we support. First, we support increased federal funding for the highway program -- something which the current Trust Fund balance can sustain under current user taxes.

Second, we support increased flexibility for states to transfer apportioned funds between categorical programs, so that states can exercise greater authority in deciding how federal funds should be used.

On the other hand we strongly oppose proposals to change funding formulas in a way which would reduce our funding and our ability to meet highway needs in our states, even if those proposals are combined with "flexibility" provisions.

We also strongly oppose the Administration's initiative to reduce the Federal share and increase the state share of funding projects. That proposal would be particularly devastating to rural states, which already impose higher than average per capita transportation taxes in order to meet their obligation to support the Federal system.

In short, we believe that the new highway legislation should make only modest changes in a successful program. We support evolution, not revolution, and the balance of my statement today will explain more fully why we recommend that position to Congress.

A BALANCED PROGRAM MUST RECOGNIZE NATIONAL INTERESTS IN RURAL AS WELL AS URBAN AREAS

Transportation is not a rural or urban issue, a big state or little state issue, but rather a national issue. A citizen in rural America has the same inherent right to efficient transportation as does his urban counterpart. We must continue to develop a transportation system that addresses movement of commodities and people in rural and urban areas.

Federal aid highways in rural states such as North Dakota serve major national interests. First, they facilitate cross country travel in the national economic and defense interest. It is in the interest of the people on the west coast to have the capacity to move people and goods between their area and the major population centers in the east and midwest. Therefore, we must maintain a donor\donee relationship if we are to have a truly national highway system. If changes in the highway program make it difficult or impossible for North Dakota and other "bridge" states to maintain these roads, that national need for an interconnected system will not be met.

There is also a critical national interest in the movement of nationally significant commodities. The federal aid highways in rural states serve to connect agricultural and other producers with national and international markets. The nation needs an integrated system to be sure that agricultural products, forest products, and other materials can move to market.

And, Mr. Chairman, we have such a system today because the founders of today's highway system recognized the national interest in a road network which could move people cross country and move goods to markets. So, as part of that national effort, we in states like North Dakota have contributed mightily to building a federal aid highway system which is bigger than we would have built solely for our local needs. We raised our gas taxes to levels higher than the national average so we could meet our obligations to a <u>national system.</u>

But today, the federal system is aging and additional dollars are needed to keep it up.

We are very concerned that some proposals we have seen would -- unintentionally perhaps -- cut back funding for rural states. Rural America must not be abandoned by its federal partner now that the emphasis of the highway program has shifted from the initial construction to preservation and rehabilitation.

Some of our roads and bridges cannot take truckloads which are routine and hardly excessive in this modern era. In extreme periods, such as spring thaw, we sometimes have to halt the movement of commodities by placing load restrictions on our roads. We are in the gradual process of strengthening the pavement on the federal-aid road system in our state to overcome this problem -- but it will take time and more money.

SYSTEM PRESERVATION

The rural western states agree with AASHTO and the Crescent Coalition that the first priority and responsibility of the reauthorization of the Federal Aid Highway Program must be to preserve the existing federal-aid highway system. Preserving the federal aid system is our most important responsibility and we must receive sufficient funding to do the job. At the same time, we must honor our commitment to fund the completion of the Interstate System.

Many segments of our Interstate and federal-aid system are over 30 years old and in dire need of rehabilitation. In many instances, rehabilitation costs will exceed the original construction costs. We have made a tremendous investment in this system and every effort should be made to preserve it.

MAINTAIN EXISTING PROGRAM

Reauthorizing the Federal Aid Program in a way which maintains the basic existing program structure will help ensure the preservation of our federal-aid highways. It has become increasingly apparent that funds which have been spent for Interstate construction are now desperately needed to maintain, rehabilitate, and reconstruct the Interstate and other federal-aid highways.

There are many proposals to significantly change the federal-aid program. The highway program is undergoing a transition from Interstate construction to highway preservation. That does not

mean that the traditional principles should be abandoned. The present program has worked well, been tested through the years, and found to be fair and equitable. Therefore, we feel the next highway program, like those enacted in the past, should be the product of evolution, not revolution.

The next Federal Aid Highway Program should retain the current federal\state sharing of responsibility for the transportation system preservation and development which is both appropriate and necessary. We believe there remains a strong need for an ongoing joint federal\state transportation program that continues or builds on the current programs. The Federal government must remain an active partner with a commitment to provide sufficient resources.

States have built many highways with the assistance of federal funds, confident that there was a long term federal commitment to these roads as part of the federal program. Now there are proposals to change the program and turn more responsibility back to the state and local jurisdictions. The commitment must not be abandoned and the federal partnership should be strengthened, not weakened.

In addition, the existing categorical funding for urban highways, secondary roads, and bridges should be maintained. This is essential so that the needs of local jurisdictions can be addressed so we will have an integrated system to move people and commodities within our cities and across the country.

ALLOCATION OF FUNDS

There are also several proposals to change the existing formulas for allocating federal highway funds. Many of the proposals put more emphasis on vehicle miles of travel (VMT) and less emphasis on lane miles as factors for allocating funds. This would have a devastating effect on rural states that have large road networks and low traffic volumes. Appropriate consideration of highway lane miles must be a major factor so that rural western states are treated fairly. Routes that carry low volumes still require a significant investment of funds to provide a safe and adequate facility. The current structure of the federal highway program provides the states with the tools they need to meet these fixed costs. These capabilities must be retained when the program is reauthorized.

To achieve this objective, the current allocation formula for Interstate preservation (I-4R) should be retained. I-4R funds are apportioned to the states according to a formula weighted 55 percent by the proportion of Interstate lane miles in each state, and 45 percent by the estimated proportion of vehicle miles traveled on the Interstate system in each state. This formula takes a balanced approach to allocating funds. The lane mile

factor accounts for the extensiveness of the system in a state and recognizes the fixed cost component of system preservation. Vehicle miles traveled reflect the use of the system and recognize the variable cost component of highway maintenance. The current formula, through the lane mile factor, enables sparsely-populated western states, which typically possess considerable Interstate mileage, to maintain their system and its serviceability. The VMT factor allows some increase in funding to states experiencing traffic growth.

A minimum allocation provision should be retained. Under the current highway bill, some of the programs include a provision that no state shall receive less that one-half of one percent of the total funding available, which recognizes the fixed cost of highway preservation. This provision should be retained in the new highway bill.

The rural western states are also concerned about the "hold harmless" provision that is included in several of the proposals for reauthorizing the highway program. In fact, the very need for a "hold harmless" provision shows the fatal flaw in the proposed formulas. The "hold harmless" provision would guarantee that each state receives an amount at least equal to its 1991 authorization under the current program. However, proposals do not provide for the "hold harmless" states to share equally in the growth of the program. All states, including rural western states, must receive an equitable share of any growth in the new federal program.

LIMITED ABILITY OF RURAL STATES TO GENERATE REVENUE

The U.S. Department of Transportation has said, despite an increasing balance in the Highway Trust Fund, state and local governments should pay a larger portion of highway transportation costs. This puts an additional strain on states that do no have the ability to generate adequate revenue at the local level.

Increasing user fees in rural western states like North Dakota does not generate a lot of revenue. The national statewide average annual yield for a penny increase in the motor fuel tax is about $26.1 million. In North Dakota one cent generates about $4.1 million, or less than one sixth the national average. On the other hand, California generates about $136 million for each cent of its motor fuel tax. This is more than the North Dakota Department of Transportation spends annually on its entire state construction and maintenance program.

38-253 O—91——10

It isn't that rural states are not trying to generate revenue on their own. In fact, residents in rural states pay some of the highest motor fuel taxes in the nation. North Dakota's motor fuel tax is 17 cents per gallon, South Dakota's is 18 cents, Montana's is 20 cents and Nebraska's is 22 cents, compared to the national average of just over 15 cents per gallon.

Many of the rural western states have very large road networks with a small population base to support the system. North Dakota has more miles of public road per capita than any other state in the nation with approximately 130 miles per thousand population compared to the national average of about 16 miles per thousand population.

On a per capita basis, residents in rural states pay a great deal more in user fees. In North Dakota, we collect $274 per capita for highway transportation, while the national average is $227. Therefore, any plan to shift more of the burden to rural states for preserving the federal-aid highway system would require either a substantial increase in motor fuel taxes, already among the highest in the nation, or a severe reduction in highway construction and preservation. This burden would fall disproportionately, on a per capita basis, on rural America.

MATCHING RATIOS

Rural western states strongly oppose the proposal, advanced by the administration, to change the matching ratios for the Federal-Aid Highway Program. Increasing local match requirements would have a devastating effect on the rural western states. As explained above, rural states are already taxing highway users more heavily than the national average. They do not have the ability to generate adequate revenue to replace or match federal dollars and still preserve and improve their transportation systems.

Under the current program, the combined matching ratios for North Dakota are about 80 percent federal and 20 percent local. Because North Dakota only generates $4.1 million from each cent of its motor fuel tax, and because local jurisdictions are limited in their ability to generate additional funding, any increase in matching ratios will have a severe impact on state and local finance.

If local matching ratios are increased significantly, it would be impossible for rural states like North Dakota to raise the required local match. This does not reflect a lack of commitment to transportation, but rather illustrates the fact that there are practical limits to a state's ability to increase taxes, particularly the ability of some states which already have high per capita transportation taxes.

NEED FOR INCREASED FUNDING

If America is to regain its leadership in the world economy, the nation must commit financially to preserve and improve its transportation systems. According to the data and information presented in "Keeping America Moving: The Bottom Line" America's expenditures for highways, at all levels of government, were about $66 billion in 1987. In order to just maintain the physical characteristics and sustain the current level of service provided today to the year 2020 an annual investment of approximately $80 billion is required. To meet this annualized need, increased federal revenues are necessary.

Across America, transportation needs exceed transportation budgets, the rural western states are no exception. The problem is not that some state receives too much, but rather that no state receives enough.

North Dakota is currently spending about $45 million in construction funds each year to preserve and improve it rural highway system. According to a study conducted by the North Dakota Department of Transportation, if we are to keep our system in the same condition in the year 2000 as it is now, we should be spending $104 million per year, or almost 2 1/3 times our current expenditures.

The need for additional revenue to improve our transportation system is evident. Federal funding levels should be increased over the life of the next highway bill and all states should share equitably in the growth of the program. Our first priority should be to spend down the Highway Trust Fund Balance, eliminate tax exemptions, and crack down of tax evasions as a means of providing additional revenue without increasing taxes. Only then should consideration be given to increasing user fees to provide an adequate, dependable, long range program.

FLEXIBILITY VS. FUNDING

Much of the discussion regarding reauthorization of the highway program has involved flexibility and funding. As to flexibility, the rural and urban states agree that there would be benefits to increasing the amount of flexibility available in the current and any future highway program. This flexibility can take the form of allowing the transfer of revenue between funding categories and flexibility in the design standards applied to federal-aid highways.

However, the concept of transferability between programs should not be confused with proposals to change allocation formulas. This confusion has arisen because some proposals to change formulas would create a new funding program called the "flexible

program." Flexibility can be achieved within the current program and we should work toward this goal. There is no need to adopt a flexible program to achieve flexibility, especially when the effect of the flexible program (as proposed to date) would be to reduce federal funding for important portions of the federal-aid system and to shift funding between states. Flexibility, in the sense of how money allocated to the state can be used by that state is a goal which the rural states can support...a flexible program, which reduces our allocation in the first instance, is a proposal which we strongly oppose.

On the subject of funding, there is also agreement among the states that our highway systems are underfunded. We can amply document the need for every federal highway trust fund dollar we receive, and our actual funding needs for the federal-aid system in North Dakota are much greater. We feel very threatened by the funding proposals and formulas that would reallocate federal funds among the states and reduce the amounts apportioned to rural states. We take little comfort in "hold harmless" provisions because we know only too well how quickly those provisions can disappear in the midst of budgets and debates.

So we oppose funding changes, whether or not combined with desired flexibility provisions, which reduce our funding and prevents us from addressing highway needs within our state.

OTHER ISSUES OF CONCERN

There are several other issues that concern the rural western states that are related to the reauthorization of the Federal-Aid Highway Program. Some of these include: public lands, protecting the Highway Trust Fund from outside interests, federal standards, sanctions, the movement of agricultural products and railroad abandonments.

Matching Share for Public Lands States

Some of the western states have a large amount of federal land that does not generate local tax revenue. For states with non-taxable national forest lands, public lands, Indian reservations, and national park lands, the western states support the continuation of the sliding scale provisions of Section 120 of Title 23, United States Code, for establishing the federal share payable in the Federal Aid Highway Program.

Protect the Highway Trust Fund

There has been increasing pressure to use dedicated highway funds to support other programs or reduce the federal deficit. Financing transportation facilities through user fees has been very successful and every effort should be made to ensure that these fees are protected and used for the purpose they were collected.

Using Motor Fuel Taxes for Deficit Reduction

There has been a great deal of discussion about increasing the federal motor fuel tax 10 to 50 cents per gallon and using the revenue for deficit reduction. We all realize the federal deficit is a major problem that must be addressed. But, the deficit reduction burden should not fall on the transportation industry and should not undermine the trust fund and user fee concepts. Such an increase in motor fuel taxes would inhibit the ability of state and local governments to raise additional revenue to fund local transportation projects and match federal funds.

Spending Limitations

As a means of balancing the federal budget, Congress has imposed spending limitations on federal highway funds. This has impacted all the states. For example, in fiscal year 1988, North Dakota's total apportionment was $72.8 million. As a result of obligational spending limitations North Dakota was allowed to spend only $61 million.

In the past few years, the Congress has held back over $34 million that North Dakota could have used on its road network. The revenue was collected to be spent on roads and bridges. Therefore, the spending limitations should be lifted and the funds should be made available for highway projects.

Federal Standards and Regulations

There is a need to relax some of the federal standards and regulations and provide the states some flexibility for implementing these requirements. Federal design standards are needed to ensure that we have uniform and safe highways as we travel throughout the country. There are instances where some standards do not apply to low volume roads in rural areas. In these situations there should be flexibility to allow the project to be built to the needs of the area in a cost-effective manner.

Sanctions

In the past few years there have been many attempts and proposals to impose sanctions on highway funds for non-compliance with federal regulations. In many instances the sanctions may be counterproductive. Sanctions take away needed highway funds and reduce the ability of the state to accomplish its mission of providing a safe and efficient highway system.

The sanctions are often poorly targeted. In many instances, the highway agency has no responsibility, or authority, to deal with the program on which the sanctions are being imposed.

Sanctions should be eliminated and where appropriate, incentives should be developed to encourage states to meet federal goals.

Movement of Agricultural Products and Raw Materials

A primary responsibility of North Dakota's highway system, and that of many other rural states, is moving commodities. The concern is not increasing capacity to carry more traffic, but improving the structural strength of the system to carry heavier loads. Many of the roads and bridges have reached, or are approaching, the end of their design life and were not built to handle modern loads.

We must never lose sight of the federal role in transporting nationally significant products such as food, forest products, coal and minerals. The Federal Government should have an interest in funding roads in rural areas from the standpoint that agriculture feeds the American people and generates millions of jobs. Farm-to-market transportation is critical, not only for basic human needs such as food and shelter, but also for our national economy.

Many of the rural western states like North Dakota, South Dakota, Montana, Utah, Nevada, and Wyoming function as bridge states. Highways in these states serve Canadian traffic and are vital to activities on the Pacific Rim and in the Great Lakes Region. Highways in these states are needed to provide connecting links to other parts of the country and are essential for the movement of nationally significant products.

Roads and bridges are a vital link to economic prosperity. The competitiveness of American goods and services is undermined by not investing in highways -- bad roads add costs to American products. Future economic growth will be accelerated or restricted depending on the quality of our transportation system.

Railroad Abandonment

The abandonment of rail branchlines in many of the rural states has put an additional burden on the road network. Commodities are now moved longer distances in trucks to reach a mainline railroad or their market destination. In addition, as rail lines are abandoned the costs of upgrading the facilities for moving commodities are passed from the private sector to the public sector.

North Dakota is the most dependent rail state in the nation. For the crop years 1984 to 1987 just over 76 percent of the grain and oilseed production was shipped by rail. Since 1980 over 700 miles of branchlines have been abandoned in the state. As a result, rail service has been lost in three counties and over 50 communities. When rail lines are abandoned the commodities are moved by truck, putting additional pressure on the road system. Many of our roads and b_'dges were not designed to handle this concentration of heavy loads.

CONCLUSION

The future challenge is to maintain and build upon our past achievements by continuing to ensure a safe and efficient transportation system promoting economic growth. After completing the Interstate system, the nation must be committed to the preservation and continued development of our transportation system, both for the interests of the citizens and the nation as a whole. We strongly believe that reauthorization of the Federal Aid Highway Program should retain the current federal\state sharing of responsibility for the transportation system development.

In preparing the next highway bill we must look at the total picture of urban and rural interests. We can't fight amongst each other. We can meet these challenges only by renewing the federal\state partnership and working together to achieve our goals to preserve the transportation system America has built.

There is a need for a concerted and coordinated effort by all levels of government to renew our commitment to improving our transportation system. The kind of highway system that will bind our nation together in the future will be the result of a national program supported by state government, local officials, and highway users from all over the country.

Federal funding levels should be increased over the life of the highway bill. All states should share equitably in the growth of the program. Our first priority should be to spend down the Highway Trust Fund balance, eliminate tax exemptions, and crack down on tax evasions as a means of providing additional revenue

without increasing taxes. Then consideration should be given to increasing user fees to provide a long range dependable federal highway program.

In summary, the rural western states oppose drastic changes in the current Federal-Aid Highway Program. Many of the major changes being proposed will have significant and adverse effects on the highway programs in rural states. Some changes are necessary, and in some cases, long overdue. However, lets make those needed changes through evolution, rather than revolution.

Mr. Chairman, that completes my prepared statement. I would be happy to respond to any questions.

TESTIMONY OF GOVERNOR EVAN BAYH
BEFORE THE HOUSE SUBCOMMITTEE ON SURFACE TRANSPORTATION
MARCH 13, 1990

Mr. Chairman, I am pleased to respond to Congressman McCloskey's invitation to present testimony to the House Public Works Subcommittee on Surface Transportation concerning Indiana's highway needs and, in particular, one project near and dear to the hearts of both of us -- the proposed Indianapolis-to-Evansville highway. Thank you for the opportunity.

As an introductory matter, I would like to express my appreciation to Secretary of Transportation Sam Skinner for starting the process of developing a long-range federal transportation policy. The efforts of the United States Department of Transportation in accumulating a wide range of information and drafting a proposed policy is an important first step toward the passage of an innovative and equitable Surface Transportation Act in 1991. I, in fact, support a number of Secretary Skinner's proposals, such as the development of a highway system of national significance. I also strongly support the concept of increased flexibility for state and local projects, which should not only allow for some cost reduction in projects, but also decrease the amount of time necessary to complete projects. States know their own transportation problems and priorities better than anyone. They have the necessary technical expertise to remedy those problems at the state and local level, assuming a responsible degree of support from the federal level. The plan to permit states to utilize toll financing, even if federal funds are also to be used on the same project, is an appreciated new financing option. In short, there

are many good things that can be said about the Secretary's plan.

Still, while there are a number of concepts in the USDOT policy proposal that we support, there are others that are rather disturbing. First is the increased matching ratio to be required on many state and local projects. The increased matching ratio will substantially shift the financial burden of preserving and developing highways and other transportation networks to the states. It is not only unfair, but imprudent, for the federal government to dilute its responsibility to support and coordinate the development of an efficient national transportation system. Another problem that disturbs us in Indiana is the lack of language supporting a minimum allocation concept. Indiana has been, and continues to be, a donor state. The minimum allocation provision of the 1982 Surface Transportation Assistance Act was very important to Indiana, as it guaranteed the state receiving at least 85 cents per federal dollar sent to Washington. This year Indiana will receive approximately $70 million in minimum allocation funds. We simply cannot accept a policy which removes this cornerstone of highway funding equity.

While Indiana strongly resists any abdication of the federal role in transportation, I would like to point out that Indiana is not simply waiting for the federal government to solve our transportation problems. We believe the key to a sound transportation system is a strong partnership between federal and state government. To be sure Indiana was positioned to keep up its share of the bargain, I proposed in my inaugural State of the

State Address -- almost a year and a half ago -- to put our new lottery proceeds in a "Build Indiana Fund" to be used for capital improvement projects, including highways and other transportation infrastructure. While I hope to have even more money earmarked for capital highway construction, I have been generally successful in protecting substantial amounts of Build Indiana Fund monies for new highway construction.

In keeping with our state's commitment to developing its transportation infrastructure, and in concert with the creation of the "Build Indiana Fund", I recently announced my administration's ten year highway improvement program which, for the first time in Indiana, attempts to develop long-range intermodal transportation plans based on comprehensive data. A key element of the program is its emphasis on preserving and maintaining the tremendous investment we have in Indiana's roads and bridges. Preservation needs will more than double over the next ten years because of the need to rebuild our older interstate highways and to replace the large number of recently deficient bridges built during the public work programs of the 1930s. A respectable level of capital improvements has been identified to be constructed over the next decade. While we are continually striving to do more with less, for example we have initiated a state-of-the-art freeway management system to manage congestion on the Borman Expressway in Northwest Indiana, we have also recognized the need to build new roadways to reduce congestion and solve other transportation problems. I encourage

you to ask your colleague and our able representative on this body, Pete Visclosky, about the freeway management system and other transportation initiatives we are pursuing in his transportation-rich district.

This brings me to the project which generated my invitation from Congressman McCloskey to address this Subcommittee. The country, including the State of Indiana, has changed dramatically since the development of the interstate routes. Demographic and economic changes have caused some areas to be developed that were not considered when the original interstate system was mapped out. Unfortunately, the third largest city in Indiana and its environs was left without interstate access to the capital and the wide-ranging interstate access found there. The proposed highway between Evansville and Indianapolis is a perfect example of how a strong federal/state partnership in highway development can provide a much-needed and well-deserved transportation artery for the citizens of, not only Indiana but, the entire region and nation.

The extension of an interstate quality road from Indianapolis to Evansville will provide much-needed rural access which must be a goal of any credible national transportation policy. The new transportation policy expresses concern for economic development, and I believe a new system providing access between Indianapolis and Evansville will help achieve the nation's economic development goals. Other states in the region, most notably Kentucky, would also benefit from the development of this

highway. Ultimately, we hope that the Indianapolis-to-Evansville highway could serve as a major link to effectively extend I-69 from Northern Michigan through the heartland to Memphis and the interstate access that city enjoys. This would truly be a highway of national significance.

Indiana has been, and will continue to be, a good partner for transportation projects in general. We have committed ourselves to long-range intermodal planning and identifying new transportation infrastructure funding sources. In addition, Indiana is being a good partner specifically for the Evansville-to-Indianapolis project. We are spending millions of dollars on location and preliminary environmental studies to further specify the route along the corridor that a $500,000 federal study last summer found had a positive benefit/cost ratio. We have placed in our program, and are fully developing for construction, a significant new four-lane segment of the route, which has an estimated construction cost in excess of a quarter of a billion dollars. My administration is committed to securing this funding, the Indiana legislature permitting, from the Build Indiana Fund and other state sources, if necessary. We are prepared to continue to provide our fair share of the financial commitment for this project, but need our partners at the federal -- and to a lesser degree the local -- level to meet their partnership obligations so that an interstate quality facility can be completed between Indianapolis and Evansville.

Again, I would like to thank you for the opportunity to provide my thoughts on the needs of our highways and also to address some of the specific problems and opportunities we face in Indiana. While I have focused as an example on the proposed Indianapolis to Evansville highway, there are many other important transportation projects in Indiana that will benefit from a continued strong federal and state partnership.

I wish you well and offer my continuing assistance as you embark on your work in developing the new transportation program.

THE PREPARED STATEMENT OF
ROBERT K. BEST

THE CRESCENT COALITION

RECOMMENDATIONS FOR A NATIONAL SURFACE TRANSPORTATION ASSISTANCE PROGRAM

February 7, 1990

PARTICIPATING STATE TRANSPORTATION AGENCIES

The following state transportation agencies support the Crescent Coalition concepts while retaining the right to pursue issues unique to their respective interests.

AGENCY	CHIEF ADMINISTRATIVE OFFICER	STAFF CONTACT	PHONE NUMBER
Alabama	Royce G. King	Donald Vaughn	205/242-6319
California	Robert K. Best	Carl B. Williams	916/445-1462
Florida	Ben G. Watts	Douglas Callaway	904/488-3054
Idaho	George Neumayer	Hugh Lydston	208/334-8818
Indiana	Christine W. Letts	Dennis Faulkenberg	317/232-5643
North Carolina	Thomas J. Harrelson	Hannah Byron	919/733-2520
Oklahoma	Neal A. McCaleb	Monty C. Murphy	405/521-2701
Texas	Arnold W. Oliver	Thomas A. Griebel	512/463-8655
		David E. Soileau	512/463-6081
Wisconsin	Ronald R. Fiedler	Thomas Walker	608/266-1113
		Roger L. Schrantz	608/266-6479

February 20, 1990

INTRODUCTION

THE CRESCENT COALITION

The Crescent Coalition consists of state transportation agencies from states with widely differing geographic, demographic, economic, and vehicle traffic characteristics. These states have coalesced around eleven principles that offer the prospect for common solutions to their diverse transportation needs. The Coalition came together to pursue open, in-depth discussions of significant transportation-related policy issues, and to seek a consensus on solutions that would serve the interest of all Coalition states.

WHAT THE COALITION SEEKS

The Crescent Coalition, with the American Association of State Highway and Transportation Officials (AASHTO) and other associations, seeks national transportation policies and actions, at federal, state, and local governmental levels, that respond effectively to the many transportation challenges and demands implicit in a competitive world economy and a steadily urbanizing America.

The Coalition seeks:

- greater program flexibility to meet regionally diverse needs within a globalized economy;
- a federal-state-local partnership to design innovative solutions to complex transportation problems;
- stronger program management at state and local levels;
- greater integration and interconnection among key transportation systems and modes; and,
- new and expanded investments necessary at all levels of government to finance total system needs.

The primary principle that binds the Coalition together is the critical need for maximum program and funding flexibility for the states. Our nation is a very diverse one. Each state must have sufficient funding resources, including federal aid, to respond to its transportation needs. Each state must also have the flexibility to use its total resources to respond to its distinctive circumstances and objectives, consistent with national goals as defined by Congress.

THE COALITION'S RELATIONSHIP TO AASHTO

The Crescent Coalition firmly supports the AASHTO recommendations embodied in "New Transportation Concepts For A New Century." However, Crescent Coalition recommendations in some instances address issues in greater detail, and speak to additional issues not addressed by AASHTO.

What AASHTO, as a formal public interest association, cannot do -- and what the agencies within this coalition can do and intend to do -- is participate actively in the legislative process. The Coalition agencies will work with our Congressional delegations, Congressional committees, the President and his administration, and various interest groups to develop solid support for the collective policy recommendations of AASHTO and of the Coalition itself, to achieve their Congressional enactment.

SUMMARY OF THE COALITION'S RECOMMENDATIONS

The Coalition is making two equally important recommendations: We strongly urge increasing the level of federal investment in highways and public transportation.With equal urgency and regardless of funding level, we recommend significant structural changes in the overall federal transportation partnership. We believe those structural changes are critical to an efficient and responsive use of transportation resources.

PRINCIPLES

Principle 1. A Focused Federal Role
The emerging national transportation program must support a focused federal role which ensures the effective functioning of a policy-defined national system that supports national defense, economic interests, and interstate mobility.

Principle 2. Partnerships, Flexibility and Leadership
The emerging national transportation program must permit each state, in cooperation with its local entities, to define and coordinate the responsibilities of each level of government within it. The new program must provide each state the maximum flexibility to determine its unique transportation priorities, consistent with national goals as defined by Congress.

Principle 3. Taxing Equity
The emerging national transportation program must assess and distribute all federally imposed transportation taxes and user fees fairly.

Principle 4. Federal Resource Allocation
The emerging national transportation program must apportion federal transportation assistance to the states using methods and criteria not directly coupled to rigid system definitions or conditions. Its funding formulas and distribution techniques should not bias either the definition of a national transportation system or reports of its condition.

Principle 5. Shared Responsibilities
To support an effective program of shared responsibility, the emerging national transportation program must provide for increased funding at all levels of government over the long term.

Principle 6. Funding Integrity and Equity
The emerging national transportation program must reserve all federally imposed transportation excise taxes and user fees solely for transportation purposes. The program must end the diversion of transportation funds through artificial spending caps, fuel tax evasion, and special tax exemptions. It must release the revenues from all federally imposed transportation excise taxes to states and local entities at the earliest possible time. It must allow maximum flexibility in the use of those revenues. It must encourage the development of new and equitable funding resources.

Principle 7. Promoting Economic Interests
In addition to social and defense considerations, the emerging national transportation program must link all major transportation policies to local, state, national and international economic interests.

Principle 8. An Integrated Transportation System
The emerging national transportation program must address transportation issues as integrated multimodal systems rather than as a group of competing modes, categories, projects and jurisdictions.

Principle 9. Streamlining and Efficiency
The emerging national transportation program must end repetitious, excessive, and conflicting federal requirements and reviews of state and local activities.

Principle 10. Federal Leadership
The emerging national transportation program must provide effective federal leadership in strategic planning, transportation safety and research and development.

Principle 11. Energy and Air Quality
The emerging national transportation program must recognize that transportation systems and projects impact, and are impacted by, air quality and energy goals. The program must assure the development of mutually re-enforcing policies to meet clean air and energy goals in ways that are consistent with transportation's primary contribution to mobility and economic competitiveness.

RECOMMENDATIONS

A HIGHWAY SYSTEM OF NATIONAL SIGNIFICANCE:

- National goals for the country's interstate and international commerce, defense, transportation safety, and international relations are closely intertwined. An efficient transportation network advances those goals by facilitating the free and ready movement of people, goods, and information. Our general welfare suffers when transportation systems are under-funded, ineffectively managed, and thus unable to meet growing and changing needs.

- For over three decades, the development of the nation's 43,500 mile Interstate highway system has been the cornerstone of the national transportation program. While our nation has accomplished this goal, it has also become more metropolitan in nature. The nation must now respond to new global economic and environmental challenges. To unite our nation, we built competing transportation systems. We must now shift our focus to improving the contribution of each of those systems to the competitiveness of each of our regions in the global marketplace.

- The Crescent Coalition fully supports the AASHTO policy recommendation to establish a highway system of national significance. The Coalition also agrees with AASHTO that that system should be made up of the existing Interstate highways and an appropriate portion of the principal arterial system necessary to address major national goals, provide access to markets, and to meet a myriad of federal responsibilities. In cooperation with the United States Department of Transportation (USDOT), each state would designate those segments of its principal arterials to be included in its statewide portion of the highway System of National Significance (SONS).

- Selection would be based upon criteria that reflect national objectives. Thus, the SONS would include all Interstate highways and those portions of the principal arterials that meet one or more of the following criteria: nationally significant truck routes; the national defense highway network; routes that provide

nationally significant commodities with access to markets; access points to significant national parks, international border crossings, ports and airports; and facilities that will provide logical connection between major population centers and to the SONS itself. The U. S. Department of Transportation would review and approve the state-designated SONS. A state could amend its designated SONS segments commensurate with changes in its particular conditions and circumstances.

- A categorical highway program should receive half of federal highway program funds. The new program should allocate those funds to the states based upon indirect factors which correlate well with direct national interests. This would maintain the policy basis for the definition of the SONS. The Coalition fully supports AASHTO's recommendation of an allocation system based on total statewide urban and rural lane miles, total statewide urban and rural vehicle miles traveled (VMT), and other appropriate factors. In addition, the Coalition proposes that the formula consider diesel fuel consumption.

  Specifically, the Coalition proposes that the allocation system should distribute:

  - Two-ninths of the funds based on total statewide rural lane miles and VMT;
  - Four-ninths based on total statewide urban lane miles and VMT; and
  - Three-ninths based on statewide diesel fuel consumption to reflect heavy truck travel.

  We believe that this allocation system would, for the most part, work well for most states. Several states with large land area and small population are concerned that this formula would inadequately reflect the problems experienced by states with low population density. In response to these concerns, the Coalition recommends that the Congress consider providing a "low population density" supplement to the SONS allocation. (See Appendix.)

- Fair allocation formulas and increased federal funding for the categorical highway program should provide adequate funding support for policy-based SONS priorities. A fair allocation formula should provide each state with a fair and equitable return of those monies it has paid to the federal government in the form of federal transportation user fees. Realistically, however, there may be extreme situations that would not be accomodated by a formula allocation. To assure sufficient funding in such cases, the Coalition recommends that the new federal-aid highway program continue to apply the current one-half percent guarantee and the current 85% minimum allocation guarantee to the categorical program.

- The new federal-aid transportation program must assure full state accountability in the categorical highway program. See "Accountability" under "Issues of National Significance," below.

A FLEXIBLE FEDERAL-AID HIGHWAY PROGRAM:

- Federal responsibility for national defense, interstate and interregional commerce, and interstate mobility is not limited to SONS routes. Americans living in small cities and rural communities are also entitled to the services and growth opportunities afforded by safe and effective access to the SONS. Congestion on urban and suburban streets costs billions of hours in national productivity. Reducing that lost productivity is critical. Those travelling to and from our nation's principal roadway system deserve reasonably consistent safety and quality standards on supporting transportation systems providing access to the SONS. These transportation needs beyond the SONS are truly national in scope. Thus, continued federal funding assistance for highways not included in the SONS is appropriate.

- Each state will require a unique mix of capital and operating strategies to meet present and future transportation problems involving metropolitan congestion, rural access, and air quality preservation. Besides addressing state, regional, and local travel demands, these strategies must be sensitive to the environmental and other "quality of life" concerns of the communities they serve. The new national transportation program should support these efforts with simple and direct national policies that encourage regional "systems" approaches which will work across modal lines, overcome jurisdictional boundaries, and transcend the traditional separation of public and private responsibilities. However, it should not mandate such approaches.

- The Crescent Coalition supports the AASHTO policy recommendation to establish a Flexible Federal-aid Highway Program. We also agree with AASHTO that the flexible highway program should enable each state to pursue broad national objectives related to the state and local transportation systems. We suggest that the flexible federal-aid highway system consist of all highways (including the bridges on them) functionally classified as arterials, urban collectors, and rural collectors, other than those included in the SONS. The flexible highway program also should fund urban mobility projects, all forms of transportation systems management projects, rural access projects, intermodal access projects, and other modal concerns.

- Each state, through the appropriate legislative body and (when appropriate) in cooperation with its regional and local agencies, would establish guidelines defining the roles and responsibilities of each agency. They would also set distinctive state criteria for setting priorities and encouraging regional multi-modal solutions, as appropriate. The state guidelines should assure that each agency has the flexibility to use the funds for those transportation solutions which bring the most efficient increase in mobility and best address land use, air quality, and economic development.

- Once each year, each state shall allocate in aggregate to non-state systems an amount of flexible program apportionment equal to not less than the amount of its FY 1991 apportionment of urban funds, secondary funds, and bridge funds made available to non-state systems of that state.

- To provide full state-by-state flexibility, the Coalition endorses the AASHTO recommendation that the new federal-aid transportation program allocate half of federal highway program funds to states for their flexible program projects. While providing critical support to important national transportation needs, the flexible program pursues objectives that are predominantly related to the state and local transportation system. Thus, transfer of funds between states, such as is accomplished through the allocation formulas suggested for the categorical highway program would be inappropriate. Each state should receive a pro rata share, based upon its percentage of total federal highway user contributions.

- The new federal-aid transportation program must assure full accountability in the flexible highway program as it relates to issues of national significance. See "Accountability" under "Issues of National Significance," below.

ISSUES OF NATIONAL SIGNIFICANCE

Both federal-aid highway programs -- the categorical federal-aid highway program and the flexible program -- and the mass transit assistance program must address the following issues:

Metropolitan Transportation

- The emerging prominence of the service and information economies has refocused much of the nation's economic activity to large, sprawling metropolitan regions. Much of that activity has spread to the suburbs. Beltways created as urban bypasses for long interstate trips have become the backbone of the suburban commuter network. Radial transit and highway infrastructure put in

place to serve central business district commuting patterns does not serve the new and dispersed interurban travel patterns well. Our nation needs creative metropolitan transportation policies to respond to this growing challenge.

- Broadening the horizons for public transportation would be one such creative new policy. The American Public Transit Association (APTA) has called for "broadening the definition of public transit, diversifying services, and shouldering a clear responsibility to manage mobility." To meet the diverse needs of their transit sub-markets, the metroplexes of the 21st century will need a broad approach. The new federal-aid transportation program can meet their need only through an expanded service concept for federal funding of transit.

- The Coalition agrees with AASHTO's recommendation that substantial federal financing for public transportation should continue. The federal-aid transportation program should devote the full resources of the Mass Transit Account (taxes plus interest), as well as the balances that have accumulated over the years, to broader concepts of public transportation.

- The new federal-aid transportation program should continue current Mass Transit Account (MTA) funding for rail modernization, new starts, and extensions. However, the MTA program also should include eligibility for fixed guideways, transitway or busway facilities, bus replacement, and exclusive high-occupancy vehicle lanes. It should distribute all remaining amounts of unallocated MTA resources to the states and transit agencies by formula. The formula should distribute those funds one-half according to population, and one--half according to the process used in the existing UMTA Section 9 formula. Traditional transit, urban mobility projects, and all forms of high-occupancy and shared-ride service should receive their funding through this distribution formula.

- The nation urgently needs comprehensive congestion management. Each metropolitan area above 200,000 population should develop a coordinated and comprehensive area-wide transportation plan to identify urban and suburban mobility needs and objectives. Federal participation should be through funding and technical assistance. The mobility plans of metropolitan areas with a population over one million should be more explicit in specifying how the metropolitan area will achieve its congestion relief objectives. Where appropriate, those plans should have a multi-state focus. Plans should also include the state's implementation timetable. The new federal-aid transportation program should strongly encourage multi-modal planning solutions.

- Federal program guidelines should promote innovative solutions to the most severe congestion problems. Metropolitan areas have limited opportunities for

physical expansion of SONS facilities. Those areas must be able to enhance the performance of the SONS by developing supporting subsystems. Thus, improvements that are not on the designated SONS sometimes provide direct, measurable benefits to SONS operations. Federal guidelines should permit states to use SONS funds in those areas to implement such improvements, provided the improvements are consistent with the metropolitan area's congestion relief plans.

Rural Access

- The Coalition strongly believes it is in the national interest to provide federal assistance to give rural America access and connection to the SONS. The products of rural America compete economically in national and international markets. The tax base in rural areas depends upon adequate rural transportation facilities.

- A major purpose of the flexible program would be to provide federal assistance for access to rural areas not adequately served by the SONS. To most effectively meet the unique needs of rural areas, the program should allow states, in cooperation with their other localities, greater latitude in setting project priorities.

- Rural highways and bridges provide: truck access for transport of natural resources and agricultural and rural manufactured products; mobility for rural commerce and travel and rural public transportation; and the connection of small and mid-size cities to each other and to the SONS.

- Adequate rural public transportation systems are critical to the economic vitality of rural America. They also serve the transportation needs of the rural elderly and handicapped. These systems should continue to receive federal financial assistance.

Energy and Air Quality

- The new federal-aid transportation program must recognize that transportation systems and projects impact, and are impacted by, air quality and energy goals. The federal government should assure that its transportation, air quality, and energy policies are mutually re-enforcing. The new federal-aid transportation program should also provide appropriate incentives and performance criteria to meet clean air and energy goals. However, those incentives and performance criteria must be consistent with transportation's primary commitments to mobility and economic competitiveness.

Highway Safety

- Our nation's highways are significantly safer because of the federal assistance programs of the past 20 years. However, motor vehicle deaths and injuries remain a major national problem. With a continued 4 percent annual growth in traffic volumes, the annual highway death toll could reach 80,000 by the year 2000 unless our fatality rate is reduced. Such an increase in highway deaths is unacceptable. To reduce the mileage death rate, the Coalition recommends that the federal government should continue to advance national highway safety goals. The Coalition also recommends that the federal government should continue to provide technical assistance to each state in its effort to develop a Safety Management Plan. Through this plan, each state would set forth its strategy for addressing its existing and emerging safety problems.

- The Coalition recommends restructuring the present highway safety programs to minimize application requirements and "red tape," and to increase program flexibility. We support two basic programs, one that is driver-oriented, and one that is roadway-oriented. Both basic programs should give the states the flexibility to address those highway safety problems that most concern them.

- The Coalition recommends continued federal funding of highway safety research, program evaluation, data collection and analysis, enforcement, education and training, and technical assistance to state and local governments.

Accountability

- The new federal-aid transportation program should assure the Congress that federal program funding improves the performance and capacity of the nation's transportation system. The Coalition recommends that improvements to the system be measured using four principal transportation management plans:

  - A pavement management plan,
  - A bridge management plan,
  - A safety management plan, and
  - A congestion management plan.

  Each state should prepare and adopt those plans using criteria appropriate to its particular circumstances.

  The planning processes should recognize the need for diversity among the states. The plans should be dynamic, multi-modal, and strategic in character; should

substitute for other program controls and should be amendable without sanctions. This approach would be an effective way to assure state accountability to Congress.

Other Significant Program Concerns

- A national transportation policy should set the direction and encourage strategic coordinated planning. Congress can set the example by ensuring that national policies and planning requirements are mutually reinforcing.

- The federal government should be a leader in advancing new technologies. That responsibility includes both leadership and funding of transportation research and development of national significance. The new national transportation program should establish a national transportation technology research and development program. That program should target promising experimental technology to increase existing capacity, to create more efficient system links, and to otherwise improve transportation productivity and relieve congestion.

- Private firms can often benefit economically from technological innovations. When that is the case, the private sector should also be a principal source of funding for transportation technology research and development.

- The Coalition is committed to a funding increase for research and development when such an increase is sufficiently justified. However, no specific national transportation research and development agenda and strategy has yet been established. Until such an agenda and strategy is created, it would be premature either to set specific funding levels or to define the precise cost-sharing relationship between the federal government and private sectors.

- The FHWA has largely accomplished its mission to foster professional development in the state highway and transportation departments. The states have become highly sophisticated in engineering and regulatory compliance. In recognition of the competency it has created in the states, FHWA should relax many of its regulations and oversight requirements. The states should have full authority and responsibility for design standards and engineering decisions affecting the flexible program. As members of AASHTO, the states are competent to insure proper engineering and uniformity in project development and construction.

FINANCING PROVISIONS:

Sufficiency and Equity

- The nation is moving to convert the present interstate-dominated, multi-categorized federal highway program to a simplified, post-interstate program. In that conversion, all states must receive total federal dollars (after adjustment for discretionary funding; emergency relief; funding for forest highways, Indian reservation roads, parkways and park roads; funding for highway-related safety grants and Bureau of Motor Carrier Safety Grants; and special interest or "demonstration" projects) in FY 1992 and later years that at least equals FY 1991 funding. Moreover, the potential hold-harmless states should share in all federal program increases at an equitable percentage growth rate.

- An increased commitment of real dollars will be necessary to maintain and expand the nation's highway and transit systems adequately over the next several decades. Along with increased state, local, and private investments, the federal government should be a more reliable financial partner.

- The federal transportation program must distribute its funds fairly, eliminate all existing losses and administrative withholdings, and enable the states to manage the program flexibly.

- The Coalition endorses the AASHTO recommendation to increase the federal highway funding level to about $18 billion in FY 1992, and then gradually to about $26 billion by FY 1995.

- The Coalition also endorses the AASHTO recommendation to increase the federal funding level (including the current capital portion of the general fund commitment) for public transportation capital projects to about $3.5 billion in FY 1992, and then gradually to about $5 billion by FY 1995.

- Congress must approve one final authorization amount to fulfill the long-standing commitment to complete the Interstate system (as defined in the 1989 Interstate Cost Estimate) and Interstate Substitute Projects. Those authorizations and distributions should be timed based on a state-by-state obligation plan coordinated through FHWA.

- Because of limitations placed on their obligation authority, the states have been prevented from using their full apportionments of federal transportation funds. The carryover of those accumulated apportionment balances will be an important issue in the transition from the current federal-aid transportation

program to a new one. The simplest and most direct solution is to follow the long-standing recommendation of most proponents of stable highway financing: to make the federal Highway Trust Fund permanent, and to remove all obligation limits. States could then obligate their carryover apportionments without restriction.

- The new federal-aid transportation program should reserve for transportation purposes the full balances of all revenues from federally imposed transportation taxes and user fees. It should also terminate funding the federal gasohol tax exemption from the Highway Trust Fund.

State and Federal Funding Share

- The new federal-aid transportation program should provide for funding the SONS program with a mix of federal and state-local funds. It should allow states to use those funds for rehabilitation, resurfacing, and restoration projects; for capacity enhancing projects; and where required, for new facilities on new locations. The federal share payable for SONS projects should be 85 percent.

- The Coalition strongly believes that the federal share payable for Flexible program projects should be the same as the SONS, 85 percent. The Coalition strongly opposes a federally mandated state or local overmatch. However, we support the AASHTO recommendation that the states retain the option to set a different state share.

Flexibility

- The Coalition supports the AASHTO position that a state shall have the discretion to transfer up to 20 percent of its total highway federal-aid apportionment either way between that state's Categorical Highway Program and that state's Flexible Highway Program.

Bridge Program

- The Coalition strongly supports AASHTO's recommendation that the new federal-aid highway program fund routine bridge replacements within the SONS and Flexible programs. The Coalition also agrees with AASHTO that the new program should establish a limited bridge discretionary program. The discretionary program should be limited to bridge projects for which funding is limited or unavailable, and funding should be limited to not more than 2 percent of total highway allocations.

Federal Lands

- For states with non-taxable national forest lands, public lands, Indian lands, and national parks and monuments lands, the Coalition supports continuing the "sliding scale" provisions of Section 120 of Title 23, United States Code, for establishing the federal share payable in both the Categorical and the Flexible Federal-aid Highway Programs.

Creative Financing

- The new federal-aid transportation program should encourage creative financing for high-cost capital projects, such as advanced construction funding, toll provisions, and multi-state compacts.

- Meeting future needs of our transportation system will require the creative application of new and existing user financing techniques. The new federal-aid transportation program should allow a state to impose tolls on its new connections and on extensions of existing transportation facilities without prejudicing the availability of federal-aid funding to that state. The state should be allowed to use the toll revenues to add capacity and otherwise relieve system congestion, and to commingle toll revenues with revenues from any other source.

- National objectives should encourage increased transit use. Current federal tax laws provide significant incentives to use automobiles, and significant disincentives to use public transit. Congress should revise those laws to support our national objectives by creating more equality in the competition among transportation modes.

Privatization

- Privatization and increased participation of private sector capital supplement -- but do not supplant -- increased public investment in transportation.

- The Coalition recommends that the new federal-aid transportation program should permit more private sector participation. The new program should also allow states to lease space in roadside rest areas to private concerns for for-profit enterprise. The private concern would be required to maintain the rest area's free public services, in addition to paying the state rent. The rent the state received would be used to construct new roadside rest areas. Similarly, the new program should allow states to install new toll facilities on selected existing segments of the SONS. The new program would require the states to use all

toll revenues above operating and debt service costs to improve the performance of SONS facilities, or to construct parallel facilities that carry no tolls.

- Recent tax code "reforms" have sharply curtailed federal tax exemptions for state and local revenue bonds. While this has eliminated some abuses, it has also sharply curtailed public-private sector partnerships for needed physical improvements to our transportation system. Congress must review the impact of its policies on state and local revenue bonds, and must restore support for tax incentives which encourage increased private-sector participation in publicly funded transportation projects.

APPENDIX

A FEDERAL HIGHWAY FINANCING OPTION

We are entering the post-Interstate construction era of "new transportation concepts for a new century." In the early 1990's, we must reshape traditional national highway programs to respond to those emerging concepts. If we heed the recommendations of AASHTO, U.S. DOT, the Highway Users Federation, and other associations, we must streamline the jumble of current federal highway programs to meet new challenges. In consolidating and reshaping the federal programs to respond to new national highway goals, old formulas for distributing federal funds among the states become obsolete. We must replace these old allocation formulas with new formulas that fit the new federal program design.

Some of the old formulas are truly archaic. For example, the Primary formula (formula A), the Secondary formula, and the Rail-Highway Crossing formula in part distribute federal funds based on proportionate rural delivery route mileage, intercity mail route mileage, and area. These formulas are more attuned to the 1920's goal of getting the nation out of the mud, rather than the 2020's goal of getting the nation out of the traffic jam. They may have worked in times past, but they clearly are out of step with the 21st century. If we are to reshape old federal programs to handle new and demanding challenges, we have no choice but to create new allocation formulas.

WHAT AASHTO HAS DECIDED:

1. In its recommendations on the direction of the future Federal Surface Transportation Program and for a National Transportation Policy, AASHTO proposes a two faceted federal highway program:

    a. A highway System of National Significance (SONS) -- limited in size, but powerful in purpose -- to serve the principal interstate commerce and mobility goals of the nation. Composed of existing interstates and some principal arterial highways, the SONS is intended to be a

state-designated federally approved national system. Ultimately, it is expected to result in a 150,000 to 180,000 highway system.

b. A Flexible Highway Program (FLEX) aimed at providing state and local governments with a flexible capacity to meet their distinctive highway needs. The FLEX will focus on urban mobility, suburban congestion, rural access and modal interlinks.

2. AASHTO recommends that the federal highway program be increased from its current $13.5 billion level to near $18 billion in fiscal 1992, and then gradually be further increased to $26 billion by fiscal 1995.

3. AASHTO recommends that funds necessary for emergency relief, federal lands highways, and a modest discretionary bridge program be set aside from total federal highway program funds first. (Funds for the discretionary bridge program should not exceed 2% of the total federal program).

4. AASHTO then recommends that remaining federal funds for the nation's highways be divided equally, half to the SONS program and half to the FLEX program. (Because of the allocation methods discussed below it is unlikely that funds allocated to individual states from each of those programs would reflect the national 50-50 split.)

5. AASHTO has recommended that factors directly related to the highway System of National Significance not be used for the state-by-state distribution of federal funds. Instead, AASHTO has recommended that funds be allocated through a formula using total statewide urban and rural vehicle miles of travel (VMT), total statewide urban and rural lane miles, and "other appropriate factors." AASHTO, however, did not say what "other appropriate factors" should be used, nor how the five (or more) factors should be weighted.

6. To be sure that each state receives a sufficient share of the national SONS funds, AASHTO further recommends that the SONS federal program retain the existing one-half percent minimum and the existing 85% minimum allocation.

7. AASHTO recommends that the FLEX program avoid a donor/donee relationship among various states. Instead, AASHTO recommends that all FLEX funds be allocated among the states so that each state receives

38-253 O—91——11

FLEX funds in proportion to the highway user contributions to Federal Highway Trust Fund attributable to that state.

8. For flexibility, AASHTO recommends that each state be permitted to shift up to 20 percent of its total state allocation (both SONS and FLEX) either way between the SONS and the FLEX programs.

9. Presumably, planning and research and safety programs would be financed from within the SONS and FLEX programs.

10. Two AASHTO recommendations may consume some resources early in the 1990's, postponing the full implementation of the long-range AASHTO recommendations:

    - For the past several years, states have been unable to use their full annual apportionment of highway funds because of obligation limits. By the end of 1991, these unobligated apportionment balances will total about $11 billion. AASHTO recommends that states be permitted full use of their carryover balances.

    - In addition, all approved Interstate system highways and Interstate substitution projects will not be completely funded by fiscal 1991. AASHTO urges the prompt funding and completion of these projects.

11. In its recommendations, AASHTO demonstrates its concern that, in the shift to a new program structure, states should not experience a reduction in basic federal funding.

    a. A "hold harmless" provision would ensure that each state would receive at least as much in total federal highway funding under the new program as it received in fiscal 1991, assuming that all states had completed their Interstate highway systems.

    b. Each state's "hold harmless" threshold would include its fiscal 1991 dollar amount for Interstate Completion (adjusted to one-half percent of total national allocations), Interstate 4R, Primary, Secondary, Bridges, Metro Planning, Hazard Elimination, Rail-Highway Crossings, and Minimum Allocation. The threshold would not include Interstate Completion amounts above one-half percent, Interstate Substitution amounts, and any discretionary or demonstration project funding.

12. All states, including those on "hold harmless," should enjoy some share of federal program increases. Thus, AASHTO recommends a percentage growth in hold harmless allocations at an "equitable percentage growth rate" in relation to total federal highway funding growth. AASHTO, however, did not say what that "equitable percentage growth rate" should be.

WHAT STILL NEEDS TO BE DECIDED:

13. To develop a complete state-by-state estimate of expected federal funds under the new federal program within the AASHTO federal highway financing framework, only three questions remain unanswered:

    a.) In addition to total statewide urban and rural vehicle miles of travel and lane miles, what should be the "other appropriate factor(s)," used in the SONS allocation formula?

    b.) What should be the relative weighting among the SONS formula factors?

    c.) What should be the "equitable percentage growth rate" related to federal funding growth for the "hold harmless" guarantee?

A COMPLETED ALLOCATION SYSTEM OPTION:

14. To complete the AASHTO financing framework, first consider what "other appropriate factor(s)" (in addition to total statewide urban and rural lane miles and vehicle miles of travel) should be used to distribute SONS funding.

    a. To begin, consider the purposes of "lane miles" and "VMT" in the formula:

        1) Total statewide urban and rural lane miles within a state is intended to reflect the <u>extensiveness</u> -- both in rural and urban areas -- of the potential SONS network within the state. As a measure of extensiveness, "lane miles" is superior to "raw land area." The total road network more accurately reflects the character of land use requirements for transportation.

2) Total statewide urban and rural VMT is intended to reflect the intensity of usage of the SONS network within the state. However, VMT is a good measure of the intensity of small vehicle personal travel. It is an inadequate measure of the impact of large truck travel, a major part of SONS traffic.

b. Commercial truck travel is, of course, a dominant contributor to the economic and interstate commerce goals of the SONS. The SONS allocation formula should give significant weight to reliable indicators of the intensity of heavy truck travel. In the future, it would be preferable to collect data that precisely measure the number and weight of heavy truck travel in each state. At present, however, diesel fuel use data are consistently collected. Those data are relatively accurate, and should be used until more precise measures are available to indicate commercial truck travel.

15. Next, consider the appropriate relative weighting among the SONS formula factors: diesel fuel consumption, total statewide urban and rural lane miles, and total statewide urban and rural vehicle miles of travel.

a. There is no scientific guidance in assigning weight to these three factors. Each may be presumed to be of equal importance. Thus, assigning each factor a weight of one-third is reasonable.

b. In assigning relative weighting to urban and rural lane miles and VMT, however, a body of information is available to guide our decision. "The Bottom Line" report, published by AASHTO in 1988, estimated the dollar costs to preserve and improve the nations highways for the next three decades. The report suggests that SONS costs in urban areas are more than twice SONS costs in rural areas. Thus, it is appropriate to weight urban lane miles and VMT a more heavily than rural lane miles and VMT.

16. Combining these considerations, we can construct a SONS allocation formula as follows:

- One-ninth for proportionate total statewide rural lane miles.
- One-ninth for proportionate total statewide rural VMT.
- Two-ninths for proportionate total statewide urban lane miles.
- Two-ninths for proportionate total statewide urban VMT.
- Three-ninths for proportionate total statewide diesel fuel use.

HOLD HARMLESS GROWTH RATES:

17. To complete the AASHTO financial framework, consider what should be the "equitable growth percentage rate" in the "hold harmless" guarantee. That is, if the federal program did increase by 30% (from the expected $13.5 billion in the base year fiscal 1991 to $17.6 billion in fiscal 1992), what should be the percentage growth rate in the "hold harmless" guarantee for each state? Again, there is no scientific guidance for deciding the matter.

    a. The AASHTO policy appropriately suggests that "hold harmless" states should enjoy some growth in federal funding when the total federal program increases. Yet, to set "hold harmless" growth at a rate equal to the growth of the total federal program increase would have the effect of "freezing" the 1991 distribution pattern for the next three decades. This would frustrate the opportunity to respond to the new challenges of the new century.

    b. As with setting the weight of formula factors, reasonable judgement is our only standard in setting an equitable growth percentage rate for "hold harmless" states.

CONCERNS OF LARGE AREA - SMALL POPULATION STATES:

18. The allocation system option described above appears to work quite well for most states. Any problems that states with smaller land area may experience with the formula are fully corrected by the guarantee of receiving not less than one-half percent of the SONS categorical allocation.

    Several states with a large land area and a small population in the Rocky Mountain area are seriously concerned that the basic formula option inadequately recognizes the problems associated with light population density. If desired, the SONS formula could be modified to provide supplement for the states with few people per square mile.

19. As with factor weighting and "hold harmless" growth rates, reasonable judgement is essential in setting a SONS formula supplement for light population density states.

Immediate Past President
TED HASKWORTH
Oakland, California

Executive Director
RICHARD C. HARTMAN

Good afternoon, Mr. Chairman, and distinguished members of the Committee. My name is Larry Dahms. I am the Executive Director of the Metropolitan Transportation Commission (MTC), the metropolitan transportation planning organization (MPO) serving the San Francisco Bay Area located in Oakland, California. I appreciate the opportunity to appear before you today on behalf of the National Association of Regional Councils' (NARC) Transportation Advocacy Group. I am the Vice Chairman of the Steering Committee for the Transportation Advocacy Group, which is a special organization of NARC members who have come together to advocate the interests of those regional councils that have been designated as MPOs. Our immediate mission is to address the challenges and opportunities in reauthorizing the federal-aid highway and transit acts. In this regard over the last three years we have examined the scope and nature of our transportation needs and the necessary federal response to help state and local governments address these issues.

Mr. Chairman, today I would like to present a general response to the Administration's proposal by comparing our vision of the future with that of the Administration's.

First, I want to applaud Secretary Skinner for his success and leadership in elevating transportation to the Administration's list of national priorities. He deserves lasting credit for initiating the national transportation policy process, which produced the most comprehensive assessment of the entire transportation infrastructure ever undertaken.

I do not believe it is necessary to review the litany of our Nation's pressing transportation problems. Everyday each one of us personally experiences ever increasing congestion, and we hear ever more frequently the sad commentary on the growing isolation of rural America. We generally share the Administration's views on the identification of our surface transportation problems, the connection between transportation investment and economic productivity, and the adverse economic consequences from further failure to address these needs. We part company, however, on two fundamental aspects of the vision for the future federal-aid highway and transit program—that is, the federal financial responsibility, and the fixation on so-called systems of national significance.

Mr. Chairman, just two years ago the bipartisan National Council on Public Works Improvement concluded the transportation sector is in need of a substantial resource infusion and called for a doubling of the investment in our infrastructure. The Council also called for a restoration of the federal government financial participation to historic past levels. In 1988 the federal government contributed only about one-quarter of the total investment by governments in highways and transit, an historic low. State and local governments have been taking up the slack.

Taking my own area as an example, the federal government contributes less than 10% of our transit budget of more than $1 billion annually. More than 80% comes from local sources: sales taxes, bridge tolls, and local general funds. On the highway side, more than half of our 5-year capital program is financed by state and local revenues.

The Administration's proposal to redefine the federal financial responsibility by shifting more of the financial burden for transportation to state and local governments represents a further erosion of the federal financial responsibility. We hope that even in these fiscally constrained times, the Congress will reject this proposal. Spending down the balances in the Transportation Trust funds is a starting point. We urge Congress to go a step further and enact an increase in the federal motor fuel tax.

Turning from the resource issue to the substantive program and process proposals, the intergovernmental planning and management process envisioned by the NARC - Transportation Advocacy Group responds to the same needs and goals as outlined by the Administration.

We are in agreement with the Administration on:

- The need for greater flexibility to respond to unique needs and conditions;
- The acknowledgment that our transportation infrastructure is an integrated system. You cannot describe roads based solely on their serving one primary function. Indeed, the system is inseparable, with individual facilities usually serving—at the same time—interstate, regional and local travel.
- The recognition of the need for systems management techniques as a condition for highway and transit project approvals; and
- The commitment to strengthen the planning, programming and prioritization role of MPOs to ensure integrated transportation systems, to coordinate land use and transportation investment decisions, and to organize effective programs for attaining air quality goals and other national objectives.

A part of the strengthening process is the emphasis on a joint, collaborative process to ensure all resources—federal, state, and local—are used to meet the transportation needs of our metropolitan and rural areas. A joint, collaborative process will permit federal, state and local interests to be reflected and balanced in meeting mobility needs.

We also share the recognition that transportation is vital to the Nation's economy. Our metropolitan regions are the economic building blocks of the the Nation's economy and we believe the federal government has a fundamental role in preserving and sustaining their economic health. Today the health of our metropolitan regions is increasingly threatened by congestion. The National Transportation Policy clearly recognizes congestion and rural access as national problems, yet the Administration's policies then diminish the federal responsibility in addressing this fundamental national problem. Under the Administration's plan, federal transportation resources would be focused on facilities of national significance—"the Interstate and its follow-on," according to the Secretary.

Congestion is a national problem that cannot be solved solely by widening the Interstate, by upgrading principal arterials to Interstate standards, or by building bypasses, Mr. Chairman. This facet of the administration's program proposal is inconsistent with their description of the economic benefits served by our national transportation network. We believe that to deal with congestion we need a metropolitan transportation program that will focus resources on an integrated metropolitan transportation system. And we need to have the flexibility to employ a combination of highway strategies, transit options, HOV lanes, and more effective systems management techniques.

When we propose a metropolitan systems program, we are not talking about a block grant, but rather a program to assure resources are directed to metropolitan areas for use on designated metropolitan systems. Simply put, a non-Interstate facility can be as critical as an Interstate. The various types of facilities for metropolitan travel cannot be separated because, as the Administration admits, the transportation system is an integrated system. Therefore, the resources ought to flow to where they can fulfill economic needs and potential rather than to an artificially defined network deemed to have national significance.

Mr. Chairman, Secretary Skinner used a very interesting and ironic anecdote as an opening to his presentation last Thursday. He told the story of a young Northern Virginia mother who commutes several hours per day mired in congestion on an urban Interstate. His story explicitly recognizes that urban traffic congestion has become a problem of national significance, but it also illustrates the manner in which federal highway investment policies have skewed our national transportation system.

The point is the Interstate system was not designed to serve our nation's commuters; it was designed to serve intercity travel. You can travel easily between metropolitan areas thanks to the

Interstate, but once you get within a metropolitan area, you have a problem. An inadequate investment in urban transportation systems coupled with an almost exclusive federal focus on funding the Interstate System has forced a reliance on that system. The Administration's National Transportation Policy threatens to perpetuate and even exacerbate this myopic approach.

A review of the condition and future needs of our National Transportation System can serve both to illustrate this historic imbalance and to suggest some directions for the reauthorization of the Surface Transportation Act this year. The Highway Performance Monitoring System is the Federal Highway Administration's tool for monitoring highway conditions, predicting future needs for funding, and examining alternative investment strategies. While it appears to substantially understate urban highway needs and overstate needs on the Interstate System, it represents the best available analysis tool for defining a future investment strategy for the post-Interstate era.

HPMS estimates that an annual investment of $6.5 billion annually is needed to meet rehabilitation needs on the Interstate System, while an additional $21.2 billion is needed each year to address urban needs and $16.5 billion annually for a rural program fora total annual need of $44 billion. It illustrates that the existing program fully funds Interstate needs, while only 26% of urban needs and 43% of rural needs are financed by combined local, state, and federal resources. Clearly this disparity in funding highways attracts development and traffic to a single system—the Interstate—rather than a more balanced dispersal of activity and travel within any urban area. It also demonstrates that current funding levels fall far short of meeting system needs.

While it is reasonable to require increased levels of state and local investment in urban and rural systems, an infusion of federal revenues is required as well. If we recognize that urban congestion is a national problem of economic significance, then we need to think in terms of a federal program that doesn't bias investments in this way to the disadvantage of metropolitan communities. Thus, while we should continue to sustain the Interstate, it makes sense to begin to invest adequately in a Metro System designed to address congestion problems.

A redirected federal program should be simple and focused to serve three basic objectives: sustaining the Interstate System, addressing metropolitan congestion, and providing rural access. The metropolitan System should focus on metro development objectives and congestion relief and a rural access system should focus on the multiple facets of the rural economy, i.e., extraction of natural resources, farm to market, recreation, etc. Implementation of a Metro System along with operational strategies to manage the Interstate such as ramp metering will enable the Interstate System to once again perform as intended.

This approach begins to devote federal resources toward the development of a true National Transportation System. It restores the role of the Interstate as the connector of the nation, while beginning to develop urban and rural transportation systems to distribute the traffic. It explicitly recognizes the need for a systems approach and definition and encourages a federal partnership with states and localities in building that system.

We end as we started. While there are indeed good aspects of the National Transportation Plan, we believe there are two critical defects:

- the failure to provide revenues

and

- the failure to have a real strategy for the chronic problems facing our economic regions: congestion and rural isolation.

Thank you, Mr. Chairman, and members of the Committee. I appreciate the opportunity to testify before you today, and will be happy to answer any questions you may have.

Congressman Mike DeWine

Testimony Before Subcommittee
on Surface Transportation

House Public Works and
Transportation Committee

March 13, 1990

MR. CHAIRMAN, I APPRECIATE THE OPPORTUNITY TO APPEAR BEFORE THE SUBCOMMITTEE TO DISCUSS THE INEQUITIES IN THE DISBURSEMENT OF FEDERAL HIGHWAY FUNDING. I COMMEND YOU AND THE MEMBERS OF THIS SUBCOMMITTEE, PARTICULARLY MESSRS. MCEWEN, APPLEGATE, AND TRAFICANT FOR LEADING ATTEMPTS TO MAKE THIS SYSTEM MORE FAIR.

AS YOU ARE ALL WELL AWARE, CURRENT FEDERAL-AID HIGHWAY APPORTIONMENT FORMULAS FAIL TO ALLOCATE FUNDS TO THE AREAS WHICH NEED THEM MOST. CURRENT FORMULAS, WITH THE EXCEPTION OF THE INTERSTATE 4R FORMULA, DO NOT TAKE INTO ACCOUNT THE EXTENT OF EACH STATE'S HIGHWAY SYSTEM, OR THE AMOUNT OF USE THAT SYSTEM MUST ENDURE. HIGHWAY CONDITION AND AGE ARE ALSO IGNORED UNDER CURRENT FORMULAS. UNDER THIS SYSTEM, MY STATE, OHIO, RECEIVES ONLY 85¢ ON THE DOLLAR ON ITS CONTRIBUTIONS TO THE FEDERAL HIGHWAY TRUST FUND. IN FACT, OHIO IS ONLY ONE OF 19 SO-CALLED "DONOR STATES" WHICH RECEIVE THE 85% STATUTORY MINIMUM OF THEIR FEDERAL HIGHWAY CONTRIBUTIONS.

ANOTHER PROBLEM CAUSED BY THE INADEQUACIES OF CURRENT FEDERAL-AID HIGHWAY APPORTIONMENT FORMULAS IS THE INCREASED ROLE OF THE MINIMUM ALLOCATION IN FEDERAL HIGHWAY FUNDING. THIS PROGRAM, WHICH HELPS MAKE UP THE SHORTFALL FROM THE INADEQUACIES OF EXISTING FORMULAS, NOW COMPRISES 24% OF OHIO'S TOTAL FEDERAL HIGHWAY AID. WHEN "CORRECTIONS" BECOME THIS LARGE, SURELY IT IS TIME TO ENACT AN UPDATED SET OF DISTRIBUTION CRITERIA.

FINALLY, CURRENT APPORTIONMENT FORMULAS FAIL TO SUPPORT AND ADVANCE OUR NATIONALLY RECOGNIZED TRADE AND COMPETITIVENESS GOALS. U.S. GOVERNMENT STATISTICS INDICATE THAT 11% OF ALL U.S. LABOR FORCE HOURS ARE SPENT IN SOME FORM OF HIGHWAY TRAVEL, AND THAT COMMERCIAL VEHICLE TRAVEL IS EXPECTED TO INCREASE BY 30% IN THIS DECADE ALONE. IN ADDITION, TRANSPORT COSTS, WHICH CONSTITUTE AS MUCH AS 25% OF PRODUCT PRICES FOR SOME INDUSTRIES, PLAY A MAJOR ROLE IN THE ABILITY OF STATES TO COMPETE SUCCESSFULLY IN TODAY'S CHALLENGING GLOBAL MARKETPLACE.

WHAT ALL THIS ADDS UP TO IS THAT EVEN MARGINAL IMPROVEMENTS IN OUR TRANSPORTATION SYSTEM CAN PAY BIG DIVIDENDS IN TERMS OF NATIONAL PRODUCTIVITY. CONVERSELY, SMALL INEQUITIES IN FEDERAL TRANSPORTATION INVESTMENT HAVE A SIGNIFICANT NEGATIVE IMPACT ON THE ABILITY OF STATES TO PROVIDE COMPETITIVELY PRICED GOODS AND SERVICES. U.S DEPARTMENT OF TRANSPORTATION STATISTICS GRAPHICALLY DEMONSTRATE THE CUMULATIVE EFFECT OF THE INEQUITIES IN CURRENT FUNDING DISTRIBUTION FORMULAS ON DONOR STATES LIKE OHIO.

- OHIO AND THE EIGHTEEN DONOR STATES CONTAIN 55% — MORE THAN HALF — OF THE NATIONS DEFICIENT BRIDGES;
- THE DONOR STATES CONTAIN 50% OF TOTAL INTERSTATE SYSTEM MILEAGE, BUT HAVE 65% OF THE DEFICIENT INTERSTATE MILEAGE;
- OHIO, ITSELF, HAS ONLY 3.5% OF TOTAL INTERSTATE SYSTEM MILEAGE, BUT 10.2% OF DEFICIENT INTERSTATE MILEAGE;
- THE DONOR STATES CONTAIN 49% OF ALL RURAL INTERSTATE MILEAGE, BUT 64% OF ALL DEFICIENT RURAL INTERSTATE MILES;
- WHILE AN AVERAGE OF 15% OF THE RURAL INTERSTATE MILES ARE DEFICIENT IN THE DONOR STATES, IN NON-DONOR STATES THE AVERAGE IS ONLY 8%;

CLEARLY, OHIO AND THE DONOR STATES ARE FOOTING A DISPROPORTIONATE SHARE OF THE HIGHWAY BILL. YET, IT IS THESE STATES THAT ARE ACTUALLY MOST IN NEED

OF ASSISTANCE TO MAINTAIN AND RESTORE NEGLECTED INFRASTRUCTURE. THIS IS SIMPLY NOT FAIR. NOR IS IT GOOD PUBLIC POLICY.

THIS IS PARTICULARLY DISTURBING BECAUSE DONOR STATES GENERATE MORE THAN HALF OF OUR GNP, AND CONTAIN MORE THAN HALF THE MANUFACTURING, AGRICULTURAL, AND SERVICE BASE OF THE NATION. OHIO ALONE CONTRIBUTES:

- MORE THAN 5.7% OF THE U.S EMPLOYMENT BASE;
- MORE THAN 6.3% OF THE VALUE ADDED BY U.S. MANUFACTURING;
- MORE THAN 6.6% OF U.S. EXPORT-RELATED MANUFACTURING EMPLOYMENT; AND
- MORE THAN 7% OF THE VALUE OF ALL U.S. MANUFACTURED EXPORTS.

WHAT THESE, AND OTHER STATISTICS INDICATE IS THAT CURRENT FEDERAL HIGHWAY INVESTMENT POLICY IS HAVING A CUMULATIVE DETRIMENTAL EFFECT ON THE HIGHWAY SYSTEM OF OHIO. THIS WILL ONLY ACCELERATE AS STRUCTURES REACH THE END OF THEIR DESIGN LIFE AND DETERIORATE. MOREOVER, BECAUSE OHIO IS A MAJOR TRANSPORTATION ARTERY, THE NEGATIVE EFFECTS OF THE FUNDING FORMULAS ARE COMPOUNDED. THEREFORE, IT IS IMPERATIVE THAT FEDERAL HIGHWAY FUNDS BE ALLOCATED IN A FAIR AND EQUITABLE MANNER.

DESPITE THIS NEED, FEDERAL HIGHWAY FUNDS ARE DISTRIBUTED WITHOUT ANY CONSIDERATION OF THE EXTENT OF A STATE'S COMMERCIAL AND INDUSTRIAL BASE, THEIR CONTRIBUTION TO THE GROSS NATIONAL PRODUCT, THEIR CONTRIBUTION TO U.S. EXPORT TRADE, OR THE NEED TO MAXIMIZE THE EFFICIENCY OF TRANSPORTATION. THIS POLICY DIRECTLY HINDERS OHIO'S ABILITY TO PRODUCE COMPETITIVELY PRICED GOODS AND SERVICES.

OHIO, LIKE A NUMBER OF OTHER DONOR STATES THAT HAVE EXPERIENCED SYSTEMATIC HIGHWAY DISINVESTMENT UNDER CURRENT FORMULAS, IS A KEY PLAYER IN U.S. EFFORTS TO INCREASE THE VALUE OF EXPORTS AND KEEP THE U.S. INDUSTRIAL BASE COMPETITIVE INTERNATIONALLY. IF OHIO IS TO MODERNIZE ITS MANUFACTURING BASE AND INCREASE TECHNOLOGY-DRIVEN ENTERPRISE, IT SHOULD AT LEAST HAVE THE

BENEFIT OF A FAIR SHARE OF FEDERAL HIGHWAY AID. A COMPETITIVE STATE MUST HAVE ADEQUATE ROADS AND BRIDGES, TRUCK ACCESS TO PORT AND RAIL TERMINALS, AND ADD CAPACITY WHERE NEEDED IN ORDER TO MINIMIZE DELIVERY TIME AND OTHER TRANSPORTATION COMPONENTS OF PRODUCTION.

FOR THESE REASONS, I URGE THE SUBCOMMITTEE TO INCREASE THE MINIMUM ALLOCATION BASE FROM 85% TO 90%. IF WE ARE TO MODERNIZE OUR ECONOMY TO ENSURE THAT WE CAN COMPETE IN THE 21ST CENTURY, THEN WE MUST ALSO MODERNIZE OUR HIGHWAY DISTRIBUTION FORMULAS. IN ADDITION, I URGE THE ADOPTION OF LEGISLATION WHICH WOULD ALLOW OHIO, AND OTHER DONOR STATES, THE SAME ACCESS TO DISCRETIONARY FUNDS AS IS NOW ENJOYED BY STATES WHICH GET THE HIGHEST LEVELS OF FEDERAL HIGHWAY INVESTMENT. MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE, I WILL DO ANYTHING I CAN TO ASSIST YOU IN MAKING THESE NECESSARY CHANGES IN THE LAW.

THANK YOU.

International Bridge, Tunnel and Turnpike Association

Testimony of

Allan V. Johnson

Immediate Past President, IBTTA

and

Executive Director and
Assistant Secretary-Treasurer

Ohio Turnpike Commission
Berea, Ohio

Before the

Subcommittee on Surface Transportation
House Public Works and Transportation Committee

Washington, D.C.

March 13, 1990

Reauthorization of the Federal-Aid Highway Program

Good afternoon, Mr. Chairman and members of the Subcommittee on Surface Transportation. My name is Allan V. Johnson, and I am Executive Director of the Ohio Turnpike Commission in Berea, Ohio. I also serve as Immediate Past President of the International Bridge, Tunnel and Turnpike Association (IBTTA), and it is my pleasure to appear before this distinguished panel today in that capacity. Neil Schuster, IBTTA's Executive Director is with me to help answer your questions.

IBTTA is the worldwide association representing the toll industry, with members in 20 countries on five continents. In the United States alone, IBTTA represents 47 agencies which operate 135 toll facilities in 28 states. There are almost 5,000 miles of toll roads, bridges and tunnels in the United States, about half of which are on the Interstate system. Over 3 billion vehicles travelled on U.S. toll facilities in 1988.

The Association supports and promotes the use of toll financing as an effective alternate or supplement to tax financing of the design, construction, operation and maintenance of transportation facilities wherever it is practical, feasible and prudent.

We realize the importance of this Committee's task in shaping a future federal highway program that will enable the nation to keep pace with our rapidly growing traffic demands. We also appreciate this opportunity to discuss with you the role toll financing can play in a future federal highway program, and we sincerely look forward to assisting you in this most important undertaking.

We are witnessing renewed interest in toll financing throughout the world at an almost unprecedented level. The United States is no exception, and we believe federal highway policy should encourage the use of alternative public and private funding mechanisms, especially tolls, wherever state and local governments find them to be appropriate.

The time is ripe because conditions are right.

To begin with, a growing majority of lawmakers and planners at every level of government, and the motoring public throughout the country, realize that toll financing represents a successful, well-tested means to raise revenues to build and operate vitally needed roads, bridges and tunnels.

In numerous national, state and local opinion polls, and at the ballot box, motorists are giving toll financing their overwhelming support. Growing traffic on our nation's toll facilities indicates that motorists are likely to choose the toll alternative to meet their mobility needs.

The Administration's new National Transportation Policy, unveiled to the public and to this Committee last week, recognizes that tolls can play a central role in generating the revenues we need to invest in our transportation systems for the future.

In developing the policy, the Department of Transportation held over 100 public forums to gauge the current thinking of transportation legislators, planners and users nationwide. We feel the agency accurately captured the current thinking on highway finance in this country.

As a nation, we have come to realize that there is no such thing as a free road. There are only different ways of financing these projects. We must pay for our roads, whether by toll, tax, or other mechanism.

Toll financing offers the traveller many well-documented benefits.

Because of their dedicated source of revenues, toll facilities are extremely well maintained, which translates directly into reduced vehicle operating costs. In fact, recent FHWA figures show that a road which deteriorates by one rating

level translates into a 6.3 percent increase in vehicle operating costs. Trucking firms recognize this immediately in their profit margin.

Toll roads are well patrolled, and they are safe. Our industry prides itself on a safety record second to none. In fact, toll facilities recorded .8 fatalities per 100 million vehicle miles travelled in 1988, less than one-third the national average of 2.46.

Toll financing allows construction to take place in a substantially shortened time-frame. The result is lower overall construction costs, and transportation capacity which is available to the driving public many years sooner than would otherwise be possible. In heavily congested areas, this means much less time, money, economic productivity and competitiveness wasted or lost sitting in traffic each and every day waiting for a facility to be built.

Toll projects face a very strict market test before they can move forward. This insures that only projects which are economically and financially sound, and which serve the needs of motorists, will move forward. Construction and operating costs, traffic demand and other factors in the equation must be well-documented and must offer persuasive proof that a particular facility is needed before a proposed project will receive funding in competitive financial markets.

Our industry's track record bears this out. Toll projects have an enviable record of success. In fact, traffic projections are generally on the conservative side, and in almost every case, traffic on new toll facilities has grown substantially faster than anticipated.

Toll roads are a bargain. Toll rates generally have not kept pace with inflation. Average rates in the United States are currently 3.34 cents per mile.

Toll financing fills vital road needs. A number of recently built facilities and those under development will serve needs that our existing Interstate and arterial system do not. Often, these roads, bridges and tunnels connect major portions of our nation's transportation system. And many projects will alleviate congestion in growing suburban areas, where new travel patterns emerge rapidly.

Motorists generally have the choice of using a toll facility or an alternative tax-supported route. The availability of the toll project usually means that all motorists are winners: those who travel the toll road enjoy the facility's added capacity in that particular corridor, while those who opt for the tax-supported road also enjoy less congestion.

Just as the Administration's transportation program advocates using technology to improve the efficiency of highways, toll agencies are already developing innovations to serve their patrons. One excellent example is the widespread development, testing and use, of technology to allow non-stop electronic collection of tolls. These Automatic Vehicle Identification systems will drastically reduce the time necessary to process vehicles at toll collection points. The result will be less congestion, faster passage of vehicles through toll plazas, and lower toll collection costs.

I would like to address the issue of double taxation. Our highway systems are built and maintained by user fees, and those who use our road systems pay for them.

Toll financing is no different. A motorist using a toll road financed entirely without tax revenues will pay tolls at a level to fully recover construction and maintenance costs for the toll project he uses. He also pays federal and state gasoline taxes at the pump to build and maintain the non-toll roads he uses.

Without toll roads, paid for by user fees, it would be necessary to build additional tax-supported roads, thereby requiring higher federal and state gasoline taxes.

The equation is exactly the same when federal funds participate in a toll project: motorists pay 100 percent of a hybrid project funded by tolls and taxes. The only difference is that two user fee systems come into play.

The use of tax funds means that the toll rate will be lower than if tolls were used exclusively to fund the project. Conversely, the use of tolls means that fewer tax dollars are needed than otherwise. If some combination of tolls and taxes are blended to finance 100 percent of project costs, then motorists pay these costs through two mechanisms rather than one.

There is general agreement that an increased level of highway investment nationwide is necessary. This would be true even if states were permitted to expend every federal tax dollar currently collected. AASHTO's "Bottom Line" report concluded that there is a shortfall of at least $14 billion annually to bring the present highway system up to par, let alone address the acknowledged needs of our growing highway user population.

Everyone appears committed to the continuation of user fees, which include both taxes and tolls, as the way to meet highway needs. There is also a consensus that a mix of financing sources will be needed to build and operate our highways in the future.

We seem to be heading for greater dependence on state and local governments for tomorrow's mobility. To do so, states will need the tools and the flexibility to raise the funds necessary to meet future needs.

Toll financing represents one of the most fundamental and proven tools the states should have at their disposal. And states should be given as much flexibility as possible to blend federal-aid funds and toll revenues in meeting their transportation needs.

Other conditions are emerging which could further influence decisions toward tolls. One is the development of public/private cooperation in the construction of transportation projects. Even before the privatization philosophy became a full blown movement, impact fees and donation of rights-of-way from adjacent landowners were becoming popular in assisting the financing of new roads in suburban areas.

Proposals for full privatization of road projects are emerging with greater frequency, and several projects are underway, with a growing list of others close behind. They offer persuasive evidence that there are more ways to get a highway built today than there were just a few short years ago.

These developments create a climate for policy and legislative implementation that is already changing people's minds, leading them to reconsider long-held policy positions opposed to the introduction of tolls. Such changes will not come overnight, but broad acceptance of these fundamental trends already constitutes substantial progress in the right direction.

In 1987, the federal government took a big step toward modification of its long-standing opposition to tolls, when it endorsed a limited program of federal assistance to toll financing in nine states as a demonstration program. Although still in its early stages, the program is moving steadily forward, and a number of other states have expressed interest in joining the program.

It is worth noting that several states now participating in the program did not have existing toll roads. This indicates a recognition that conventional tax funding was not going to provide enough money to build the roads needed in those states, and a willingness to change direction on toll policy to get the job done.

As you know, the federal contribution on the pilot toll projects is limited to 35 percent of project costs. It may be too early to tell if this is a proper or practical ratio of federal to state and local dollars. Time and experience will give us all better guidance in this area as these projects develop.

Federal legislation mirrors state initiatives. Landmark legislation implementing tolls came about in California and Virginia, and will likely be enacted in other states as well.

For example, California's legislature reversed its traditional no-toll-road policy twice in the recent past. Not only is Orange County developing three toll roads, but the state is now moving forward to construct up to four privately-funded toll projects.

In Virginia, legislation has allowed the Toll Road Corporation of Virginia to pursue private financing of an extension to the publicly-owned Dulles Toll Road. The project could be under construction this summer, and may be open to traffic as early as 1992.

The following is a comprehensive list of states which currently have toll facilities, and those states developing new toll projects (Puerto Rico also has toll facilities):

States With Toll Facilities

California	Louisiana	North Dakota
Delaware	Maine	Ohio
Florida	Maryland	Oklahoma
Georgia	Massachusetts	Oregon
Illinois	Michigan	Pennsylvania
Indiana	Minnesota	Rhode Island
Iowa	New Hampshire	Texas
Kansas	New Jersey	Virginia
Kentucky	New York	Washington
		West Virginia

States Developing New Toll Facilities

In addition to several states in the previous list which are also considering new toll facilities, the following states are considering tolls, most of them for the first time:

Arkansas	Minnesota
Colorado	Missouri
Idaho	South Carolina

When Congress looks at the successful development of almost 5,000 miles of toll projects in the United States despite federal restrictions on their development, it should conclude that tolls have had significant impacts in encouraging roadbuilding and other transportation improvements that probably would not otherwise have taken place. And this been accomplished with little or no federal dollars.

Each state should have the flexibility to combine federal funds and toll revenues in meeting their transportation needs, on any facility it wishes to build or improve. Our highway program should encourage, rather than discourage, states to examine and adopt innovative financing schemes including toll financing and public/private partnerships.

It follows that all toll agencies, such as the Ohio Turnpike Commission, should be freed from Section 129 tri-partite agreements signed years ago with the Federal Highway Administration and state highway and transportation departments. These agreements call for removal of tolls when the original bonds or other financial obligations are paid off.

The agreements ignore the fact, however, that these roads, built many years ago, are often in need of substantial reconstruction and maintenance which, if they become toll-free, will have to be paid for with tax funds.

It is simply inconsistent for the federal government to foster toll road construction on the one hand, and to deny that option to the state at some future date. This applies also to states which signed agreements to obtain 4-R funds for their Interstate toll road mileage, even though these funds might never be spent on those Interstate toll roads.

The decision to continue or discontinue tolls on a facility should be made by each state, based on its own economic and political situation and its then-current surface transportation needs, goals and available funding.

Another restriction, the requirement that all federal-aid funds must be repaid before tolls may be imposed on a section of federal-aid highway, is also inconsistent with changing federal policy, and should be re-examined.

The highway community should feel justifiably proud of the great system that has been built in this country, with the creation of the Interstate program and the upgrading of our arterial network.

We are going to be faced with massive infrastructure needs in the years ahead, and we will have to stretch our highway dollars any way we can to make them cover our continuing plans. The opportunities of the marketplace, under proper supervision and control, should not be overlooked in making our future financing choices.

In conclusion, Mr. Chairman and members of the Subcommittee on Surface Transportation, we respectfully request the Committee to remove federal restrictions to the application of innovative toll financing and provide relief from tri-partite agreements entered into many years ago.

We think these goals are fully compatible with, and should be an integral part of a national transportation policy for the future highway program in this country.

We applaud the effort by Secretary of Transportation Samuel Skinner in developing a national plan to provide the financing needed to fully meet our current and future highway needs. We feel his strategy accurately captures the current thinking in the United States and throughout the world. It is a plan with vision and clarity, and we respectfully urge that it be given full consideration as you begin the difficult task of shaping a future federal transportation program.

Again, thank you for the opportunity to present our views. I will be happy to answer your questions.

38-253 O—91——12

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

KERMIT H. JUSTICE, President
Secretary
Delaware Department
of Transportation

FRANCIS B. FRANCOIS
Executive Director

STATEMENT BEFORE

THE SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

Relating To

SURFACE TRANSPORTATION REAUTHORIZATION LEGISLATION:

AN OVERVIEW OF AASHTO'S "NEW TRANSPORTATION CONCEPTS FOR A NEW CENTURY" RECOMMENDATIONS

By

KERMIT H. JUSTICE
President, American Association of State Highway
and Transportation Officials
and
Secretary, Delaware Department of Transportation

Part One of a Three Part Presentation by AASHTO

March 13, 1990

Founded in 1914, AASHTO represents the departments concerned with transportation and highways in the fifty States, the District of Columbia and Puerto Rico, to foster the development, operation and maintenance of an integrated national transportation system. The active members of AASHTO are the duly constituted heads and other chief directing officials of the member transportation and highway agencies.

EXECUTIVE OFFICE: 444 N. Capitol St., NW, Suite 225, Washington D.C. 20001
Telephone (202) 624-5800 Telefax (202) 624-5806 Telex 4900009580 HTO

Mr. Chairman, I am Kermit H. Justice, President of AASHTO, and Secretary of Transportation for Delaware. On behalf of AASHTO, we are pleased to respond to the Subcommittee's request for the Association to provide you with our views on surface transportation reauthorization legislation.

Mr. Chairman, in inviting AASHTO you requested that we provide you with representation on behalf of the Association, and on behalf of the two groups of states that have expressed some concerns about the direction and content of new surface transportation legislation. We are pleased to present a panel that we believe will meet your request.

As President of AASHTO, in this Part One of our three part presentation I will discuss with you the major recommendations of the Association for surface transportation reauthorization legislation, as contained in our "New Transportation Concepts For A New Century" report, the final edition of which was published in October, 1989, and copies of which have been given to the Subcommittee.

Accompanying me today and also testifying on behalf of AASHTO are Hal Rives, Vice-President of AASHTO and Commissioner of the Georgia Department of Transportation, and Charles L. Miller, Chairman of our Task Force on a Consensus Transportation Program and Director of the Arizona Department of Transportation. Commissioner Rives will make Part Two of our AASHTO presentation, and will concentrate on the reasons additional funding is required for the highway and transit programs, AASHTO's recommendations for transportation research and highway safety, and several policy positions of the Association that go beyond the "New Concepts" report. Director Miller will present Part Three of our presentation, and will review with you the process employed by the Task Force in developing the "New Concepts" report, the results of efforts with which AASHTO has been involved to develop consensus recommendations for new surface transportation legislation, and elements of AASHTO's highway program recommendations.

Also accompanying me are Robert K. Best, Director of the California Department of Transportation, and Richard Backes, Highway Commissioner of the North Dakota Department of Transportation.

Director Best is testifying on behalf of the "Crescent Coalition", a group of state transportation agencies from states with widely differing geographic, demographic, economic, and vehicle traffic characteristics that while firmly supporting the AASHTO recommendations embodied in the "New Concepts" report, have developed recommendations that in some instances address issues in greater detail, and which speak to additional issues not addressed by AASHTO.

Commissioner Backes is appearing as a representative of a group of states that have come to be known as the "Breadbasket Coalition." While these states have participated in development of the "New Concepts" report, they have special concerns related to their common characteristic of being states with relatively large land areas, relatively small populations, and current levels of state user fee taxes that for the most part are among the highest per capita in the nation.

Mr. Chairman, in order for AASHTO to adopt policy and recommendations on the future of the surface transportation programs, or in other areas, it is necessary that at least two-thirds, or at least 35 out of 52, of our member departments vote in the affirmative. Our "New Concepts" report was developed and approved in this manner. While AASHTO has addressed and made recommendations on a wide range of general issues in the "New Concepts" report, our consensus process does not guarantee that all concerns and issues held by each of our 52 member departments have been fully addressed. It is to take up issues not fully resolved in the "New Concepts" document that these two groups of states have been engaged in discussions and work, and Director Best and Commissioner Backes will provide their views to the Subcommittee. They will help round out the views of the state departments of highways and transportation on the many issues involved in surface transportation reauthorization legislation.

Mr. Chairman, let me now turn to AASHTO's views on surface transportation reauthorization legislation. Let me first state that we recognize this particular hearing is primarily directed at the federal-aid highway program. With the Subcommittee's indulgence, Mr. Chairman, we would nevertheless like to take this opportunity to present our views on both highways and public transportation, since we regard both modes as critical in meeting the mobility needs of America. Looking nationally, AASHTO believes that we can no longer afford to address highways and public transportation separately, for in much of our nation both modes are necessary to meeting mobility needs and must function together in a coordinated manner.

Indeed, AASHTO believes that all transportation modes play a vital role in meeting America's needs to move people and freight, and that we must begin to both think and act in a more intermodal manner. It is for this reason that our "New Concepts" report includes analysis and recommendations affecting all transportation modes. We are especially concerned about assuring adequate linkages between the modes, so that they will function as one transportation system serving the nation.

We do recognize that this Subcommittee concentrates on surface transportation, and thus I will not further address the aviation, water and rail modes in this testimony. But before leaving the subject of intermodalism, a final observation. It is not possible for any one mode to meet our national transportation needs for people and freight. In order to keep our nation moving, we must explore and implement possibilities to build an interrelated network of air, rail, water and motor vehicle transportation services.

One thing is very clear, Mr. Chairman, as you and your Subcommittee recognize, the next surface transportation bill enacted by Congress must address many new issues. The 1987 Act largely completed construction funding for our Interstate Highway System, which has been the centerpiece of the Federal-aid highway program since 1956. Recognizing that there are still a few important miles of the Interstate System to be funded to completion, for the next surface transportation bill it is time for us to move beyond the

Interstate program, and prepare America's surface transportation system for the 21st century.

Mr. Chairman, the kind of transportation system we provide for the next century will make or break this nation's economy, and will directly affect the lifestyle of all Americans. We have choices to make. We can live in cities trapped in gridlock, lose time and money traveling on decaying highways, and watch as our competitive position in the world economy declines because of inadequate transportation. Or we can act to ensure the planning, research and investment in transportation necessary to keep the United States a world-class competitor, and to assure support to our life style.

GOALS, OBJECTIVES AND FEDERAL ROLE PRINCIPLES

Goals

The member departments of AASHTO have been engaged in over three years of analysis and review, resulting in adoption of our "New Concepts" report. In this process, which was carried out under the direction of our Task Force on a Consensus Transportation Program, the leadership of our 52 member departments set out seven specific national goals we believe must guide future surface transportation legislation. They are:

1. Preservation

Preservation of America's existing surface transportation system should be the primary goal of any future national transportation program since it is this system which provides the basic network upon which this nation's economic health and international vitality depend.

2. Congestion Relief

A balanced approach to increasing capacity and reducing congestion on this nation's surface transportation system should be employed, including an appropriate mix of highways and transit, and a thoughtful application of systems management technologies and demand management techniques.

3. Adequate Funding

User and benefitter fees, set at an appropriate level to cover the economic cost of the surface transportation facilities and services provided, should be dedicated solely to the funding of transportation improvements. General fund commitments to public transportation should continue.

4. Safety

The safety of Americans, using the surface transportation facilities and services, should be preserved and enhanced through the continued national commitment to safety research, safety applications and safety projects.

5. Access and Balance

The national surface transportation system should be comprised of a balanced, integrated and coordinated multi-modal network of facilities and services which provide an adequate level of access to all of the various regions of this nation.

6. Planning and Research

This nation should continue to commit sufficient funding to transportation planning and research to ensure that established goals are met, that future options do not get precluded, and that new technologies are developed and applied to transportation infrastructure in a timely manner.

7. Economic Vitality

The national surface transportation program should preserve and enhance the economic vitality of this nation by providing employment, reducing transport costs, improving freight movement productivity, revitalizing rural America, rejuvenating blighted urban areas, supporting existing land uses, attracting economic development, providing transportation for rapidly growing regions, and improving international competitiveness.

Objectives

Given these goals, AASHTO believes that the following should be the objectives of the highway and public transportation components of the next surface transportation act, and should be provided for therein:

Highways

1. System Maintenance, including pavement preservation;

2. Bridge Needs, including maintenance, repair and replacement;

3. Interstate Reconstruction, including pavement rehabilitation and preservation of the existing system;

4. Urban Congestion should be addressed with improved freeway/expressway capacity where appropriate;

5. Principal Arterials serving interstate and intrastate needs; and

6. Interstate Capacity should be increased by the addition of lanes in congested sections.

In addition, AASHTO strongly supports the prompt funding and completion of the remaining Interstate highway and Interstate substitution commitments.

Public Transportation

1. Urban Congestion should be addressed with improved public transportation services where appropriate;

2. Reconstruction and Maintenance of facilities and vehicles should be provided to preserve existing service; and

3. Mobility should be provided for the non-driving public by public transportation services.

Modal Interlinks, Applicable to Both Highways and Public Transportation

1. Access by highway and public transportation modes should be improved to ports, terminals and other modal facilities; and

2. Planning should ensure that decisions to locate ports, terminals and other modal facilities include adequate consideration of existing and future surface transportation requirements.

Federal Role Principles

AASHTO believes that all levels of government, federal, state and local, as well as the private sector, have roles to play in meeting these goals and objectives. Turning specifically to the federal role, AASHTO believes that the following eleven principles should apply to new surface transportation legislation enacted by the Congress:

1. Issues of National Significance should be included in the federal focus on transportation;

2. Systems of National Significance should be included in the federal focus on transportation;

3. Preservation Needs on the existing surface transportation should be included in the federal focus;

4. National Economic Well-Being and economic growth should be included as part of the federal focus and role in transportation;

5. Planning should be emphasized in the federal role;

6. Safety should be emphasized in the federal role;

7. Major Capital Needs requiring massive expenditures for new construction or reconstruction should be part of the federal role;

8. Research should be emphasized in the federal role;

9. Interstate or Interregional Issues should receive at least a minimum response at the federal level;

10. Emergency Relief should be provided for at the federal level; and

11. Defense should be included in the federal role in providing surface transportation.

RECOMMENDED SURFACE TRANSPORTATION PROGRAM

Building upon these goals, objectives and principles, which are more fully discussed in the "New Concepts" report, the member departments of AASHTO have developed specific recommended federal highway and public transportation programs. We have also considered at length the respective funding roles of the federal, state and local governments, and the private sector, in providing the resources necessary to reasonably and rationally meet America's surface transportation requirements. Before moving to the content of AASHTO's recommended highway and public transportation programs, let me first turn to our recommended federal funding levels.

Funding Levels

Mr. Chairman, in approaching the question of the total funding required for coming years in the highway and public transportation programs, AASHTO studied both modes in depth and engaged in lengthy analysis. The results of that effort are contained in the September, 1988 AASHTO report titled "Keeping America Moving - The Bottom Line," copies of which have been filed with the Subcommittee. Commissioner Rives will discuss this matter further, but essentially AASHTO believes that if we are to deal effectively with highway and public transportation needs into the 21st century we need to raise total annual spending by all levels of government to over $100 billion for highways and about $16 billion for public transportation, in constant dollars, compared to today's investment level of about $66 billion for highways and $14.5 billion for public transportation. We also believe that, following the goals, objectives and principles stated earlier, the overall federal percentage share of our highway program should be at least the same as has been traditional, and that the federal share of the public transportation program should be increased over the levels of recent years.

Federal-Aid Highway Program Funding

Specifically, we recommend a federal highway funding commitment of $17.6 billion in FY 1992, increasing to $19.6 billion in FY 1993, to $22.7 billion in FY 1994, and finally reaching what would be a continuing level of $25.9 billion in FY 1995. We believe these program levels are attainable for at least the first two years with no increase in federal highway user fees, by spending down the balance in the Highway Trust Fund along with terminating the gasohol drain on the Highway Trust Fund.

Of a Federal-aid highway program beginning at approximately $18 billion in FY 1992 and increasing to approximately $26 billion in FY 1995, 50 percent should be allocated to the Categorical Highway Program and 50 percent to the

Flexible State and Local Highway program; a state should be allowed to transfer up to 20 percent of its total highway apportionment either way between that state's Categorical Highway Program and Flexible State and Local Highway Program, without FHWA approval.

Minimum Allocation and Hold Harmless

Mr. Chairman, AASHTO is concerned about all states receiving equitable highway funding in a new surface transportation program. To help assure this, our approach is to continue a minimum allocation program with respect to the donor states, and to implement a hold harmless clause mainly for Western states that are large in land area and relatively sparsely populated.

Under AASHTO's recommendations, no state should receive less under a new surface transportation program than the current federal-aid highway program would provide in 1991 as if all states had completed their Interstate Highway Systems. To ensure some degree of equity of formula allocations, an 85 percent minimum allocation provision should be established and the existing 1/2 percent minimum apportionment retained for the Categorical Highway Program.

In the event federal highway funding is increased above the 1991 levels, every state, including hold harmless states, should then receive an increase in its allocation. The percentage growth in highway allocation amounts for hold harmless states should be at an equitable percentage growth rate.

Public Transportation Program Funding

With respect to public transportation, we recommend a federal capital funding level of $3.5 billion in FY 1992, rising annually to a level of about $5.0 billion by FY 1995, along with a continuation of operating assistance at the current level, which is approximately $800 million per year. Approximately $1.1 billion of these funds would be used for the Categorical Transit Program, and all other funds would be used for the Flexible State and Local Transit Program.

State and Local Funding Levels

It needs to be recognized, Mr. Chairman, that state and local governments will also need to increase their revenues to match these new, higher federal program levels. We believe this will occur, if Congress takes the lead. Looking at the states alone, 18 of them increased their highway user fees last year. Overall, state motor fuel taxes increased from an average of 8.6 cents per gallon in 1980, to 16.03 cents per gallon in 1990.

Matching Ratios

AASHTO believes that overall the federal-state/local government matching ratio in the federal-aid highway program should remain at about 85 percent federal, 15 percent state/local government. We are aware, Mr. Chairman, that the Administration is recommending that the overall federal share be cut back, in the interest of using federal dollars to leverage more state and local

dollars. Mr. Chairman, the record shows that the states and local governments have been increasing their transportation funds at a faster rate than the federal government over the past decade. They have shown that no levers need to be applied to state and local governments; these governments have generally proven they will make the maximum transportation funding effort, within their fiscal abilities. Secretary Skinner has also discussed creating differential matching ratios, depending upon the type of highway project. This concerns us, in part because when the federal/state match varies greatly from one program element to another, this fact alone can bias project programming in undesirable ways.

We believe that the federal funding levels AASHTO is recommending are both reasonable and rational. Reasonable, because, as Commissioner Rives will further explain, the funding levels are conservatively what is required to meet our transportation needs without waste or over building. Rational, because a four-year phase in will allow state and local governments to put in place the needed new matching fund levels, and prepare engineering and other project planning in an orderly manner.

AASHTO'S HIGHWAY AND PUBLIC TRANSPORTATION PROGRAM RECOMMENDATIONS

Let me now turn to our recommendations for both the highway and the public transportation programs. In both modes, we are recommending a two-component program. The first is a categorical program focused on meeting clearly national requirements, and the second is a flexible state and local program that is new in concept and which will enable the states and their local governments to tailor transportation solutions to their unique needs. Under the flexible state and local programs federal funds would be utilized only to address specific transportation issues as defined by the Congress and necessary federal oversight would be assured, but current procedures that hamper the effective use of federal funds would be eased. In the categorical programs the federal role would remain much as at present.

The "New Concepts" report describes AASHTO's highway and public transportation programs in detail. For the convenience of the Subcommittee, Mr. Chairman, the following are summaries of the Association's recommended categorical and flexible programs for highways and public transportation. The numbers in parenthesis after each section indicate the page(s) of the New Concepts report containing the recommendation.

THE AASHTO CATEGORICAL HIGHWAY PROGRAM

I-Purpose: The purpose of the Categorical Highway Program is to provide a National Highway System to serve interstate commerce and national defense needs. The National Highway System, which in the "New Concepts" report is called the Highway System of National Significance (HSNS), would be larger than the present 44,629 miles of the Interstate system, but smaller than the 303,698 mile combined total of the Interstate system and the present federal-aid primary system. (3-11)(3-15)(C-2,3).

II-Procedure:

1. This program would be focussed on a Highway System of National Significance, or National Highway System, which would consist of the present Interstate system and a portion of the principal arterial system as redefined. The redefinition necessary would include a cooperative and rigorous effort between AASHTO and the Federal Highway Administration (FHWA) to develop consistent criteria to be used by states in designating principal arterial system routes to be part of the National Highway System (3-15).

2. The formal establishment of the National Highway System should be completed as a cooperative effort between AASHTO and FHWA after adoption of federal authorization legislation. Consultation should occur with local governments and private sector users as the System is defined, and the FHWA would be given an appropriate mileage to assign in order to ensure system rationalization and route connectivity. The new National Highway System, or Highway System of National Significance, should result in a nationally consistent, state designated, federally approved system plan (3-15).

3. In defining the National Highway System, at least the following criteria should be considered in identifying existing routes and new corridors beyond the existing Interstate system:

   Serve interstate and international commerce and travel
   Provide for national defense needs
   Enhance economic vitality and international competitiveness
   Provide service to all portions of the nation

   The identification procedure should not be static, but should allow the states to respond to changing population and travel patterns over time through an objective review of the process (3-15).

4. Categorical Highway Program funds would be used for projects on the Highway System of National Significance (HSNS), or National Highway System, to:

   Reconstruct and/or rehabilitate
   Provide additional urban capacity
   Provide for pavement preservation
   Provide additional mileage needs
   Provide for bridge needs (3-14)

5. An appropriate amount of Highway Trust Fund monies would be appropriated and apportioned to each state under the Categorical Highway Program. A percentage of funds would be set aside for meeting needs like:

Transportation planning and research
Transportation safety
Transportation emergency relief
Transportation to federal lands (3-15)

6. In addition to bridge needs funded through regular Categorical Highway Program apportionments, AASHTO also supports a Discretionary Bridge Program to fund structural and/or capacity deficient bridges on any public highway if the cost of rehabilitating, replacing or supplementing the capacity of the bridge exceeded $10 million or 10 percent of the state's total annual federal-aid highway apportionments under the new highway program. An amount of funds not to exceed 2 percent of the total federal-aid highway funding should be used for this Discretionary Bridge Program (3-16).

III-Federal Oversight:

1. The Categorical Highway Program should continue to be administered in a manner similar to that employed presently. Coordination will be required in the level of the modified federal role among the state transportation agencies, regional planning bodies and local governments, particularly in the case of urban transit systems, transportation planning and modal interlink projects (3-20).

2. A streamlined certification process should be used for projects developed under the Categorical Highway Program. Differences which exist between the certification of highway and transit projects would be retained at the federal level (3-22).

IV-Funding:

1. The basic formula for distributing Categorical Highway Program funds should be driven by factors such as lane miles, travel (VMT), and other appropriate factors (3-20).

2. The matching ratio for highway and bridge improvements under the Categorical Highway Program should range between 100 and 85 percent federal dollars. For extremely important projects like roadway preservation and bridge needs the federal portion could initially be 100 percent. For other needs, like capacity

increases or additions to the system, the initial federal matching ratio could come closer to an 85 percent level. Over the first five years of any new program, AASHTO believes that the federal matching ratio for the Categorical Highway Program should be around 85 percent (3-22 and 3-23).

3. Emergency relief and Public Lands highway projects, due to their very nature, should be eligible for 100 percent federal funding (3-23).

THE AASHTO FLEXIBLE STATE AND LOCAL HIGHWAY PROGRAM

I-Purpose: The purpose of the Flexible State and Local Highway Program is to provide a highly flexible source of funding to be used at the discretion of state and local governments, as long as Federally identified transportation Issues of National Significance are being addressed. The Flexible Highway Program would replace all other federal-aid highway categories and programs now existing at the federal level. (3-17)

II-Procedure:

1. Funding for the Flexible Highway Program could be spent by states or local governments on projects which address federally adopted Issues of National Significance, like:

   Urban mobility
   Suburban congestion
   Rural access
   Modal interlinks (3-17)

   Eligible facilities and services would include:

   Other primary, rural secondary and urban routes
   Other functionally classified roadway.
   Public transit (E-25 - Figure A)

2. Flexible Highway Program funds would be administered and coordinated on a statewide basis under the direction of state officials. An appropriate amount of funding would be appropriated and apportioned to each state to fund projects like:

   Construction and reconstruction
   Rehabilitation and preservation
   Bridge needs (3-17) (E-25 - Figure A)

   Roadways and bridges which are not on the Highway System of National Significance, but are functionally classified as arterials or collectors, and any other highways or bridges which are currently eligible for

use of federal aid are eligible for improvement under the Flexible Highway Program.(3-17)

3. Flexibility of decision-making, prioritizing and programming at the state level would be achieved under the Flexible Highway Program through processes that include city and county governments and ensure consideration of their surface transportation needs. (3-17)

III-Federal Oversight:

1. Each state would prepare an annual list of projects for its Flexible Highway Program, using existing documents like the state construction program, the regional Transportation Improvement Programs and the local government project lists, for prior approval at the federal level. (3-22)

2. Annual progress reports covering the preceding year's achievements under the Flexible Highway Program would be required, and would be submitted at the same time and as a part of the annual list of projects document. The annual progress report would assure that the federally adopted Issues of National Significance are being addressed through expenditures of those federal highway funds, and would keep Congress and the Administration abreast of progress toward the national goals surrounding the Issues. (3-20)(3-22)

3. Certification for highway projects developed under the Flexible Highway Program would not occur at the individual project level, but at the statewide Program level. (3-22)

IV-Funding:

1. The Flexible Highway Program funding should be allocated to the states strictly on a pro rata share of federal Highway Trust Fund collections attributable to each state as a proportion of federal Highway Trust Fund revenues collected throughout the nation; no donor/donee relationship should exist. (3-21)

2. To ensure an equitable distribution of Flexible Highway Program apportionment by each state, Congress would specify that each state shall allocate in aggregate to non-state systems an amount of Flexible Highway Program apportionment equal to not less than their FY 1991 apportionment of urban funds, secondary funds, and bridge funds that was made available to non-state systems of the respective state. (3-17)

3. Matching ratios for the Flexible Highway Program should be determined at the state level, with care

taken to ensure that rural needs are not overlooked or overshadowed by procedures or matching ratios which preference urban transportation-related goals. (3-23)

THE AASHTO CATEGORICAL TRANSIT PROGRAM

I-Purpose: The purpose of the Categorical Transit Program is to fund capital needs for the nation's major public transportation systems (3-16).

II-Procedure:

1. The Categorical Transit Program would fund projects and programs which:

   Address major rehabilitation needs
   Address new systems and services (3-16)

2. A percentage of funds from the federal Categorical Transit Program would be set aside for meeting special needs like:

   Transit planning and research
   Elderly and handicapped transit (3-16)

3. Funding for the Categorical Transit Program would be provided through the Mass Transit Account of the Highway Trust Fund. This funding would consist of one-ninth of the current federal gasoline tax, one-fifteenth of the current federal diesel fuel tax, and one-third of the current alternative fuels tax (3-16).

4. The fiscal year 1989 funding allocation levels for rail modernization, new starts and bus capital expenditures from the federal fuel tax would be maintained and continued as discretionary grants under the Categorical Transit Program (3-17).

III-Federal Oversight:

1. The Categorical Transit Program should continue to be administered in a manner similar to that employed presently. Coordination will be required in the level of the modified federal role among the state transportation agencies, regional planning bodies and local governments, particularly in the case of urban transit systems, transportation planning and modal interlink projects (3-20).

2. A streamlined certification process would be used for projects developed under the Categorical Transit Program. Differences which exist between the

certification of highway and transit projects would be retained at the federal level (3-22).

IV-Funding: 1. For the Categorical Transit Program, the federal share should remain at the current level of 75%. For new starts, or system extensions, funding priority should be given to projects providing a non-federal share higher than the minimum 25% (3-23).

THE AASHTO FLEXIBLE STATE AND LOCAL TRANSIT PROGRAM

I-Purpose: The purpose of the Flexible State and Local Transit Program is to fund a range of capital and operating state and local transit needs with General Funds, and to fund a broadened range of capital projects with a portion of the Mass Transit Account revenues (3-17).

II-Procedure:

1. Funding under this program would be spent in addressing state and local transit needs, including:

   On-going operating assistance
   Rehabilitation needs
   New bus services
   Small urban and rural transit (3-17 to 3-18)

2. The above programs would continue to be funded from the General Funds of the U.S. Treasury, and apportioned in accordance with current law to designated transit recipients, which include local transit authorities for the large urban areas, and the states for small urban and rural areas (3-18).

3. A second component of the Flexible State and Local Transit Program would be funded from a portion of the Mass Transit Account. Under the AASHTO recommendation, all Mass Transit Account resources in excess of FY 1989 transit funding allocation levels would be distributed by a broad-based public transportation formula.

   For these Mass Transit Account formula funds, eligible projects would be broadened to permit funding for public transportation capital projects that serve to increase vehicle occupancy rates and enhance basic mobility as follows:

   Traffic signal improvements which provide priority treatment for transit and ridesharing vehicles
   Exclusive high occupancy vehicle lanes;

Transportation system management measures which provide priority treatment or improve operations for high occupancy and shared ride vehicles

Commuter rail service capital improvements which include service between multiple urbanized areas within a single state (3-18).

4. Flexible transit funds would be administered as today, with the local transit authorities being the recipients for urban areas over 200,000 population, and the states being the recipients for small urban areas and rural areas (3-21).

5. All annual Mass Transit Account revenues in excess of FY 1989 funding allocation levels would be distributed, 50% based on the current formulas, and 50% by total population (3-7[illegible]).

III-Federal Oversight:

1. The states and/or transit funding recipients would be responsible for the certification of all projects receiving federal assistance (3-22).

2. Certification for projects developed under the Flexible Transit Program would not occur at the individual project level but at the statewide or local transit agency level, depending upon who was the recipient of the funding (3-22).

3. Each state or transit funding recipient would prepare an annual list of projects, using existing documents like the state construction program, the regional Transportation Improvement Programs and the local government project lists for prior approval at the federal level (3-22).

4. Annual progress reports covering the preceding year's achievements would be submitted at the same time and as part of the same document. In this manner, the Administration, the Congress and the Federal Government would be kept abreast of progress (3-22).

IV-Funding:

1. The matching ratio for capital projects under the Flexible Transit Program is proposed to remain at 80 percent federal/20 percent state/local (3-23).

Summary

In these brief presentations of the four components of AASHTO's recommendations, Mr. Chairman, it is to be understood that many important program and other details have not been included, for reasons of brevity. Those details are contained in the text of Chapter 3 of and the "Commentary"

section of the "New Concepts" report. If any questions about AASHTO's recommendations remain after reading Chapter 3 and the "Commentary," AASHTO stands more than ready to provide any further information or needed clarifications.

Mr. Chairman, it is recognized that we are just at the beginning of the Congressional reauthorization process for our surface transportation program. We commend you and the members of the Subcommittee for initiating these hearings, and we again thank you for your invitation to appear.

Over the coming months we know that your Subcommittee will hear from many witnesses, and will consider several proposals for helping meet our surface transportation needs. We trust that the testimony you will receive today from this AASHTO panel will facilitate your work. We stand ready at any time to respond to any questions you and the members of the Subcommittee may have, Mr. Chairman, and we look forward to commenting on specific legislative proposals as they are developed by the Subcommittee.

Let me now turn to Commissioner Rives and then Director Miller, to complete our testimony on behalf of AASHTO.

Testimony
of
Charles A. Machemehl, Jr.
Chairman
American Road & Transportation Builders Association

Accompanied By
Dr. T. Peter Ruane
ARTBA President & CEO

Before
The Subcommittee on Surface Transportation
of the
House Public Works & Transportation Committee
U.S. House of Representatives

March 13, 1990

ARTBA

American Road & Transportation Builders Association

Good afternoon, Mr. Chairman and members of the subcommittee. For the record my name is Charles A. Machemehl, Jr. and I am the 1990 chairman of the American Road and Transportation Builders Association, which is based here in Washington, D.C.

My professional business involves serving as the vice president of marketing and business development for the Vulcan Materials Company in Birmingham, Alabama. I am pleased to present testimony today on the transportation needs of this nation and the relationship of the Surface Transportation Act of 1991 to meeting those needs.

I am accompanied today by Dr. T. Peter Ruane, ARTBA president and chief executive officer.

ARTBA has been providing Washington representation for the transportation construction industry since 1902. Our almost 4,000 members nationwide hail from both the public and private sectors. We represent not only construction firms but also state and local transportation officials, manufacturers of equipment, consulting engineering and design firms, material and traffic safety device suppliers and educators in the fields of transportation planning and civil engineering.

Mr. Chairman, on behalf of our membership, thank you for inviting us to provide our views on future transportation needs, identification of problems in the current program, and proposals for new program structure and funding. At the outset, I will say that we believe that the financial decisions that the Congress makes next year in the transportation area will have a direct impact on the nation's economy and well-being long into the future.

America is built on mobility. Its vast size places a high value on the ability to move people and goods over both short and long distances in an economical and efficient manner. The American highway system, developed jointly by the federal and state governments, has had more to do with our quality of life and economic prosperity than any other single factor.

Today, America's federal highway system — the backbone of our national economy — is in serious trouble.

While this network of highways and bridges comprises only 22 percent of the nation's total road mileage, it carries 81 percent of all travel — more than 1.6 trillion miles per year.

According to the U.S. Department of Transportation's 1989 report to Congress, more than 28 percent of the bridges on the federal-aid system are either "structurally deficient" or "functionally obsolete." The same report states that more than 40 percent of the pavements on the federal-aid system are in "poor" or "fair" condition (See figures 1, 2 and 3).

This 1989 report and the Federal Highway Administration's 1988 publication, *America's Challenge For Highway Transportation In The 21st Century*, both state that meeting existing capital needs on the federal-aid system alone requires a $40 billion per year

The Deterioration of the Federal Highway System

Highway System Pavement Conditions

ARTBA

The Deterioration of the Federal Highway System

Figure 3

investment in transportation construction projects — a rate of spending substantially in excess of the current obligations for the Federal-aid Highway Program.

Meeting these quantified needs on the federal-aid system is one of the major financial challenges facing the nation. Failure to provide an adequate and useable highway system will have a profound effect on the quality of American life, our economic growth and development, and our ability to meet national defense requirements.

The Federal-aid Highway Program has been a driving force behind building a better America. The reauthorization of this federal program should foster continued opportunities for growth and development.

If the program's reathorization legislation does not address known needs in a meaningful way, the deterioration of the Federal-aid Highway System, which is becoming more apparent every day, will continue, placing the American economy in danger. Today, highway disrepair and congestion are contributing to increased economic costs, air pollution and wasted energy resources.

Americans continue to commute by private automobile. Such travel is up 17 percent since 1960 and contributes to significant rush hour congestion on 65 percent of Urban Interstate System mileage. The outlook for the future is not good. Traffic is projected to grow by two to four percent per year in the decade ahead.

According to federal statistics, the nation now wastes 1.25 billion hours and 1.38 billion gallons of motor fuels due to congestion on limited access highways each year. By the year 2005, that waste could soar to 6.9 billion hours in lost productivity and 7.32 billion gallons of squandered fuel.

Economists at the U.S. Department of Transportation estimate that if our highways are allowed to continue to deteriorate, by 1995 the U.S. economy could potentially miss out on increases of 3.2 percent in Gross National Product (GNP), 5.9 percent in disposable income, 2.2 percent in employment and 2.7 percent in manufacturing productivity.

Disinvestment caused much of our current problem (See figure 4). Total public capital expenditures for highways and bridges has dropped from 1.4 percent of GNP in the early 1960s to about 0.5 percent today. During this same period, traffic on the Federal-aid Highway System has increased five fold.

Inflation has also been a hidden factor. Between 1959 and 1988, the U.S. inflation rate, as measured by the Consumer Price Index, rose slightly over 300 percent. The highway user fees supporting the Highway Trust Fund and paying for highway improvements increased by only 100 percent (See figure 5).

Assuming a moderate future inflation rate of four percent per year, the federal gasoline user fee would have to increase to 26 cents-per-gallon by the year 2000 *just to maintain its 1959 purchasing power.*

What should be done? The solution to our highway problem is obviously: we must begin investing in the future. Providing adequate resources is the key.

The Disinvestment of the Nation's Transportation Infrastructure

Total Public Expenditures for Highways, Streets, Roads and Bridges

Figure 4

Inflation's Impact on the Federal Highway Program

Inflation Versus the 1959 Highway User Fee (Gasoline)

Figure 5

One alternative is to spend the current cash balance in the Highway Account of the Highway Trust Fund to address the call for greater highway improvement expenditures. But how far will that $10 billion balance go?

An examination of the language of the *Highway Revenue Act* authorizing the Highway Trust Fund shows that deficit spending in this fund is prohibited. Since the entire balance cannot be spent, the portion that is available, between $5 and $8 billion, will not significantly increase the current program.

Apogee Research, a leading public works consulting firm based here in Washington, has developed a computer model for us which allows a review of possible program funding scenarios and their effect on the trust fund balance and program spend out. We will share this information with the subcommitee and its staff as it is developed.

The American Road and Transportation Builders Association believes the reauthorization bill drafted by this subcommittee should provide $40 billion per year for highway and bridge improvements. This authorization level should commence in 1992 and continue for a minimum of five fiscal years thereafter. Such a program level is totally consistent with the needs identified by the U.S. Department of Transportation referred to earlier in our testimony.

To authorize and carry-out a program of this magnitude, we recommend that the Congress:

- Ensure that all federal highway user fee revenue contributed to the Highway Trust Fund — plus interest earned on that money — is spent in a timely manner. A drawdown in the trust fund's current $10 billion-plus cash balance should begin during the next fiscal year.

- Remove the Federal-aid Highway Program from the Unified Federal Budget in order to ensure that revenues are not impounded or withheld in the future.

- Increase the federal highway user fees — effective in fiscal year 1992 — to raise the additional $25 billion per year that is necessary for a $40 billion per year federal program of highway improvement assistance.

- No longer impose artificial obligation ceilings on the expenditure of federal highway funds.

- Repeal the current six cents-per-gallon federal tax exemption on gasohol sales for highway vehicle usage (which causes an estimated $500 million per year loss to the Highway Trust Fund); and

- Tighten federal highway motor fuels collection procedures.

These actions would assure that future generations have a highway system on which they can build. The historic role of the federal government in the development and upkeep of a national highway network should be maintained.

There is no question that the federal government has a clear role to play in the development and upkeep of a national system of highways and bridges. The federal responsibility is defined by the Constitutional mandates to regulate commerce among the states and with other nations, provide for the national defense, and safeguard the public health.

The user fee principle that has guided the financing of our national highway transportation program has contributed to its success. Highway users recognize the importance of well-maintained highways and bridges. They also realize that continued expenditures must be made in order to maintain system performance at an acceptable level. Over the years, motorists have shown a willingness to pay appropriate user fees — if they are used for their intended purpose. (See figures 6 and 7)

Recent surveys of the American public and U.S. business leaders indicate that this view is still held. In work done by Apogee Research for the Transportation Research Board, the public said overwhelmingly that they would pay higher gasoline user fees for improved highways. In a poll taken at the 1989 U.S. Chamber of Commerce annual meeting, business leaders from across the nation expressed overwhelming support for more federal expenditures for highways, recognizing that higher motor fuel taxes are necessary.

Consistent with our recommendation for increased funding, ARTBA also believes that the working partnership between the federal government and the states, which is the basis of the existing federal-aid program, must be continued.

Some have suggested that state and local governments should be responsible for raising revenue to meet future needs for rebuilding and expanding our highway system. In fact, over the last 20 years, federal support for improvements has declined over 20 percent in constant dollars.

While the federal interest has continued, state governments have worked to increase state revenues for highways to keep the system from futher deterioration.

Now is the time to re-establish the true meaning of the federal-aid highway partnership and to live up to the federal commitment to adequately fund improvements on highways and bridges significant in meeting transportation responsibilities.

The unwillingness of the federal government to raise and spend sufficient funds to maintain system performance has resulted in a program that is not fully meeting identified needs. Now is the time for bipartisan leadership in this area if we are to meet our future transportation demand.

While public, user fee supported financing should remain the keystone of our national highway improvement program, no financing option should be ignored. ARTBA sponsored a conference in 1989 on "Public/Private Ventures in Transportation" to review this opportunity for other funding mechanisms to meet transportation needs.

National Highway Revenue Receipts: 1987

The Federal Share of National Highway Revenue Receipts Has Been Decreasing Since 1985 and in 1987 Reached the Lowest Mark in 27 Years (22 Percent).

ARBA

Figure 6

The Federal Highway User Fee Represents Less Than 1% of the Total Annual Transportation Spending by the Average American Consumer

Figure 7

Public/private ventures have long been successful in other countries and are gaining support in this country. They must be explored and implemented where appropriate.

Proper investment is the key to meeting future highway needs. With our views on record as to investment and the method of meeting this investment requirement, let me turn to ARTBA's views regarding program structure and allocation of resources.

A FEDERAL HIGHWAY PROGRAM FOR THE FUTURE

With a $40 billion per year federal investment, America CAN meet its highway and bridge capital requirements for the next century. Here's how that money could be put to work to restore — and expand — our national highway system.

COMPLETING THE INTERSTATE HIGHWAY SYSTEM

The 42,797-mile Interstate Highway System accounts for only 5.2 percent of the federal network mileage, yet carries 27 percent of the traffic. It's clearly the backbone of our national surface transportation system.

Construction on this system began in 1956. Today, 98 percent of the system is open to traffic. According to the Federal Highway Administration, an additional $5 billion is needed for completion. Let's finish the job!

ARTBA Recommendations:

- Fund completion of the full Interstate Highway System with a one-time final authorization of $5 billion. Since actual use of these funds would be spread over several years, an allowance for inflation should also be provided.

- To be eligible for these funds, however, Congress should require that construction on all remaining projects begin no later than September 30, 1996. Additionally, adequate funds should be made available under the "Advance Construction/Interstate Program" to fully repay all states that have used this option.

PROTECTING THE INTERSTATE HIGHWAY INVESTMENT

Highway users have invested more than $100 billion in the Interstate Highway System, making it perhaps the nation's greatest physical asset. Today, however, more than 40 percent of the pavement mileage on the Interstate System is below minimum engineering standards. Let's protect our investment!

The Federal Highway Administration says that an annual investment of up to $6.1 billion is necessary *just to maintain 1985 conditions* on the Interstate System.

ARTBA Recommendations:

- Initiate a major Interstate rebuilding program by authorizing a $6.6 billion per year Interstate 4-R program of resurfacing, restoration, rehabilitation and reconstruction. Assure that the latest in pavement design technology is utilized in this effort to maximize the return on investment.

- Authorize an additional $400 million per year for Interstate 4-R discretionary programs, with $200 million per year allocated to fund unusually high-cost bridge projects on the system.

- Set the federal/state funding ratio for Interstate "4-R" at 90/10, including projects to add new lanes or construct essential new interchanges.

- Ensure that any future additions to the Interstate System are automatically eligible for 4-R funding and maintain existing provisions in law which allow the transfer of new construction funds to 4-R work.

- Give states the flexibility to transfer up to 50 percent of their share of "4-R" funding to projects in other program categories of national importance, provided that the state can satisfy the U.S. Department of Transportation that its Interstate mileage is being adequately maintained.

REBUILDING OUR BRIDGES

More than 238,000 — or about 40 percent — of the nation's bridges are either "structurally deficient" or "functionally obsolete," according to the U.S. Department of Transportation. As noted previously, 28 percent of these bridges are on the federal system.

The inherent safety problems and economic displacements posed by deficient bridges demands that repairing them become a national priority of the highest order.

The Federal Highway Administration says that $50.7 billion is needed to rehabilitate or replace all deficient bridges on the federal system.

ARTBA Recommendations:

• Require each state to develop a plan that systematically addresses their bridge problems and assigns highest priority to repairing or replacing structurally deficient structures.

• Authorize $5 billion per year to repair the nation's bridges. While this funding should be directed primarily toward bridges on the federal-aid system, allow off-system bridges to remain eligible for federal funding with certain restrictions as permitted under current law.

• Allocate bridge rehabilitation funds on a "cost-to-complete" basis (continue the current one-quarter percent minimum, 10 percent maximum formula).

• Set the federal/state funding ratio at 90/10. Do not allow a state to transfer bridge funding to other program categories unless it can demonstrate to the U.S. Department of Transportation that it is pursuing a program that specifically addresses structurally deficient bridges as a priority.

CREATING A REGIONAL PRIMARY SYSTEM

This 258,120-mile system is the nation's second most important network of highways. It serves as a collector system for the Interstate and services traffic in corridors not on Interstate routes. The Primary System currently handles 29 percent of the nation's traffic mileage.

The Federal Highway Administration says that an annual investment of up to $6.7 billion is necessary *just to maintain 1985 conditions* on the Primary System.

ARTBA Recommendations:

• Make the Primary System a truly regional road network by changing the definition of the type of mileage that is eligible for inclusion. The reduced system would include only routes of national significance that meet interstate and inter-regional traffic needs.

• Provide $6 billion per year to rehabilitate the Primary System and upgrade as many of these routes as possible to near-Interstate standard. Set the federal/state funding ratio at 90/10 and give states with well-maintained Primary routes the flexibility to transfer up to 50 percent of their Primary funding to other program categories.

38-253 O—91——13

RELIEVING TRAFFIC CONGESTION

Anyone who lives in an urban/suburban area knows traffic congestion first-hand. Without improved traffic management and added capacity the situation will only get worse. A new national program is needed to address this problem.

The Federal Highway Administration says that an annual investment of up to $7.4 billion is necessary *just to maintain 1985 conditions* on the Urban System.

ARTBA Recommendations:

• Create a "Metropolitan Area Transportation Assistance Program," funded at $4.5 billion per year, to help alleviate traffic congestion in urban/suburban areas with 50,000+ population. The program envisioned would direct federal funds to projects that are part of strategic regional plans that attack congestion. Projects funded under this program would include road and bridge capacity improvements, roadway rehabilitation projects that improve traffic flow, creation of "High Occupancy Vehicle" (HOV) and exclusive bus lanes, implementation of freeway surveillance, incident response systems and "smart highway" computer technology.

• Set the federal/state funding ratio at 70/30 and require that eligible routes be on the federal system. Give states flexibility in designating routes to be included in urban areas.

STIMULATING ECONOMIC GROWTH WITH NEW TRANSPORTATION CORRIDORS

The demographics of the United States have changed dramatically since the plans for the Interstate Highway System were drawn over 40 years ago. Many distant "suburbs" now provide more jobs than the major cities linked by the current Interstate System. Population shifts, particularly to the South and West, have created unprecedented demand for new transportation service. It's time the federal highway program recognized — and assisted — these emerging economic centers.

ARTBA Recommendations:

• Create a "New Transportation Corridors Program," funded at $3.5 billion per year, to assist high-growth areas not currently served by the Interstate System. The program would be aimed at building new highways — and upgrading existing ones to near-Interstate standard — to provide capacity for the increased traffic volume that is associated with emerging economic centers. Eligibility for participation in the program would be based on criteria such as population growth rate, measurable economic activity and potential for further economic growth.

• Set the federal/state funding ratio for the "New Transportation Corridors Program" at 70/30.

MOBILIZING RURAL AMERICA

With a redefined — and smaller — federal Primary System, an expanded Secondary Highway System would assume even greater importance. This system, which now includes 398,328 miles of highway in rural America, provides the vital farm-to-market and small community-to-market transportation link that is so important to the nation's economy and well-being.

The Federal Highway Administration says that an annual investment of up to $1.7 billion is necessary *just to maintain 1985 conditions* on the Secondary System.

ARTBA Recommendations:

- Provide $5 billion per year for an expanded rural highway support program.

- Set the federal/state match for this program at 70/30.

IMPROVING HIGHWAY SAFETY

While there have been significant advances in highway design, safety equipment and signage over the past several decades, the carnage on our nation's highways continues. In 1989, more than 45,000 Americans were involved in highway fatalities and another three million were injured in traffic accidents. Clearly a more aggressive effort to improve highway safety is warranted.

ARTBA Recommendations:

- Increase federal highway safety funding to $2 billion per year, continuing all categorical safety programs that are in current law.

- Initiate a federal study of highway signage and traffic safety devices to determine the need to rehabilitate or upgrade such devices on the federal system to incorporate new technologies.

- Provide funds to improve worker and motorist safety in highway construction areas.

- Require that products and services that enhance safety and improve traffic operations be included criteria for all federal "3-R" and "4-R" programs.

INVESTING IN RESEARCH

Every effort must be made to ensure that we receive maximum benefit from every dollar invested in highway capital improvements. Greatly increased emphasis must be placed on public and private highway research and development programs.

ARTBA Recommendations:

• Authorize $2 billion per year to support expanded federal highway research programs.

• Encourage — through special tax incentives and other means — private sector research and development projects that have the potential to improve the quality, durability, safety and operation of our highways and bridges.

OTHER ISSUES

In our view, as part of its highway program reauthorization legislation, Congress should also take action to:

• Make the federal Highway Trust Fund permanent.

• Ensure that each state receives back at least 90 percent of the revenue that it contributes to the Highway Trust Fund.

• Levy user fees on all motor fuels — including gasohol — in an amount at least equal to that levied on gasoline to ensure that adequate highway improvement funds are available.

• Expand the Federal Lands Program to $1.5 billion per year.

• Provide greater flexibility in the co-mingling of federal assistance and toll revenue to finance capital improvements on toll facilities.

• Provide $500 million per year for emergency relief.

• Revise the federal Disadvantaged Business Enterprise program to ensure that it is aiding firms that are truly in need of assistance.

IT'S AN INVESTMENT IN THE FUTURE

America is literally at a crossroad. We can continue to ignore our serious and growing highway and bridge problems. Or we can choose to make the investment — about $40 billion per year — that is necessary to rebuild and expand our national highway network to meet future demands.

Good roads save lives. Improve productivity. Enhance competitiveness. And reduce pollution-causing, energy-wasting traffic congestion. In short, they're an investment in the future.

Together, let's build a better America through transportation. The time to act is NOW!

FEDERAL HIGHWAY PROGRAM FUNDING RECOMMENDATIONS

(Per Fiscal Year)

Interstate Construction*	$1.0 Billion
Interstate 4-R	$6.6 Billion
Interstate 4-R Discretionary	$0.4 Billion
Bridge Rehabilitation & Replacement	$5.0 Billion
Primary System	$6.0 Billion
Metropolitan Area Assistance Program	$4.5 Billion
New Transportation Corridors	$3.5 Billion
Secondary/Rural System	$5.0 Billion
Highway Safety	$2.0 Billion
Federal Highway Research Programs	$2.0 Billion
Minimum Allocation Program	$2.0 Billion
Federal Lands Program	$1.5 Billion
Emergency Relief	$0.5 Billion
TOTAL	$40 Billion

* The authorization for the Interstate Construction program is currently $3.15 billion and $1.4 billion, respectively, for Fiscal Years 1992 and 1993 by the *Surface Transportation and Uniform Relocation Assistance Act of 1987.* ARTBA recommends an additional appropriation of $1.75 billion in FY 1993 and $3.25 in FY 1994 to complete the Interstate Highway Program.

UNDER CURRENT FORMULAS AND MATCHING RATIOS WHAT A $40 BILLION PER YEAR FEDERAL HIGHWAY PROGRAM WOULD MEAN TO THE STATES

Mr. Chairman, before I close, a comment about the fiscal year 1991 budget proposal for the Federal-aid Highway Program is in order. The budget recently sent to Congress by President Bush calls for an obligation limitation of $12.0 billion for highways. This is a seven percent reduction from the fiscal year 1990 level after sequestration and the budget compromise.

This appears to be a step backward when the talk is for a forward-looking program. The "National Transportation Policy" enunciated by Secretary Skinner before this subcommittee last week, certainly does not talk about a reduction in the federal commitment. It talks about at least maintaining our current commitment.

The FY 91 budget must then be reviewed in the context of a need to increase the obligation limitation to at least last year's level, but preferably to a level reasonable under the *1987 Surface Transportation and Uniform Relocation Assistance Act* — $15.0 billion. This level can be achieved by using all revenue accruing to the trust fund annually, interest earned on the trust fund balance, and prior year' authorizations constrained by annual obligation limitations.

Thank you, Mr. Chairman, for the opportunity to present the views of the American Road and Transportation Builders Association on future federal highway assistance. Pete Ruane and I stand ready to answer any questions that you or subcommittee members may have.

CITY OF EVANSVILLE
ONE N W SEVENTH STREET · ROOM 302
EVANSVILLE, INDIANA 47708
(812) 426-5681

OFFICE OF THE MAYOR
FRANK F. McDONALD II

March 12, 1990

Honorable Frank McCloskey
U.S. Representative
Eighth District, Indiana
127 Cannon House Office Building
Washington D.C. 20515

Dear Congressman McCloskey:

I would like to register my support for the Federal highway funding proposal currently under consideration that will allow for commitment of funds for construction of the Evansville to Indianapolis highway. We, in Evansville, feel that the lack of direct access to our state's capital has left us cut off from the potential economic benefits that such a highway would bring.

As the Eighth District's representative, you are well aware of the critical need for this addition to the Southwestern Indiana highway network. There are several important issues that support the use of Federal funds for the construction of this highway, the most important of which is the recent commitment of the State of Indiana to fund, over the next several years, substantial improvements to segments of existing roads along the proposed route. This is a substantial commitment on the State's part.

Unfortunately, just as the Federal government cannot fund the entire project, neither can the state. We believe that a partnership between the Federal, state and local governments is the only way to make the highway a reality.

I thank you for the support that you have lent to this project thus far and look for your continued support in the future.

Sincerely,

Frank F. McDonald II

STATEMENT BEFORE

THE SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

Relating To

SURFACE TRANSPORTATION REAUTHORIZATION LEGISLATION:

DEVELOPMENT OF AASHTO'S RECOMMENDATIONS, CONSENSUS RECOMMENDATIONS AND BACKGROUND ON AASHTO'S HIGHWAY PROGRAM RECOMMENDATIONS

By

CHARLES L. MILLER
Chairman, AASHTO Task Force on a Consensus Transportation Program
and
Director, Arizona Department of Transportation

Part Three of a Three Part Presentation by AASHTO

March 13, 1990

Founded in 1914, AASHTO represents the departments concerned with transportation and highways in the fifty States, the District of Columbia and Puerto Rico, to foster the development, operation and maintenance of an integrated national transportation system. The active members of AASHTO are the duly constituted heads and other chief directing officials of the member transportation and highway agencies.

EXECUTIVE OFFICE: 444 N. Capitol St., NW, Suite 225, Washington D.C. 20001
Telephone (202) 624-5800 Telefax (202) 624-5806 Telex 4900009580 HTO

Mr. Chairman, I am Charles Miller, Director of the Arizona Department of Transportation, and Chairman of the AASHTO Task Force on a Consensus Transportation Program. It was our Task Force that developed the AASHTO report, "New Transportation Concepts For a New Century," and its extensive set of background information and reports.

In this Part Three of our AASHTO testimony responding to the Subcommittee's request, I want to address three topics. The first is to briefly review our Task Force's composition and how we have functioned since being established in early 1987. Secondly, I want to review with you the consensus building efforts initially organized by AASHTO, the status of the recommendations from those efforts on the content of new surface transportation reauthorization legislation. Finally, I want to provide some background information on the two-part highway program recommendations of AASHTO.

THE AASHTO TRANSPORTATION 2020 PROCESS

AASHTO's formal efforts to develop recommendations for the next surface transportation bill were initiated in early 1987, and were based on work done during 1986 to conduct a national conference on state highway finance held in Vermont. The AASHTO Policy Committee agreed in early 1987 to create a Task Force on a Consensus Transportation Program, and to devote the resources of the Association and our member departments to an extensive and intensive review of the highway and public transportation issues facing the nation and development of a national program addressing transportation needs and federal, state and local roles well into the 21st century. Given the scope and time frame set for our work, we adopted the theme "Transportation 2020."

In 1988 we expanded our effort to include the aviation, rail and water transportation modes, and in 1989 to include transportation research and technology transfer.

Our Task Force was created to provide broad representation from the four regions of AASHTO, and large, medium and small states. It included the chief administrative officers of sixteen states, including California, Connecticut, Delaware, Florida, Georgia, Kansas, Massachusetts, Michigan, Minnesota, Mississippi, New York, Texas, Virginia, Washington, and Wisconsin, in addition to myself from Arizona. In order to carry out the technical work the Task Force created a Highway Technical Advisory Committee, a Modal Technical Advisory Committee, a Subcommittee on Economic Expansion and Development, a SCOP Task Force, and special Task Forces on: a Highway System of National Significance; Highway Finance and Funding Allocation; and Transit Equity/Transit Finance and Funding Allocation. The work of these professional bodies was coordinated by a high level Policy Review Committee comprised of transportation professionals. Since 1987 over 50 meetings of the Task Force and its technical bodies have been held. A detailed description of this effort is contained in the Appendix of the "New Transportation Concepts For a New Century" final report, copies of which have been filed with the Subcommittee.

The overall concept of the AASHTO Transportation 2020 process centered around three basic activities: information gathering and analysis; development of alternatives and recommendations; and consensus building. The specific content of these activities is described in the Appendix to the "New Concepts" report.

Mr. Chairman, my purpose in describing our process is to emphasize that AASHTO's effort has been the most comprehensive ever undertaken by our member departments. The reports and recommendations issuing from this work provide information that has been repeatedly reviewed by the many transportation professionals in our member departments and by their chief administrative officers. These people are responsible for the design, construction and operation of America's highways, and play an increasingly greater role in the other transportation modes. We offer the results of our work to the Subcommittee, and stand ready as ever to develop any further information you may want.

CONSENSUS RECOMMENDATIONS

An important component of the Transportation 2020 effort established by AASHTO was a deliberate effort to develop consensus among the many different organizations that have an interest in federal surface transportation reauthorization legislation. It was and is our belief that if we can achieve a degree of consensus before turning to the Congress, sounder legislation would result.

In order to build a consensus, AASHTO initiated two major activities. One was creation of an Advisory Committee on Highway Policy (ACHP), chaired by Lester Lamm of the Highway Users Federation, and which ultimately involved over 100 public and private sector organizations in its work. In addition to helping our member departments sponsor 65 forums held nationwide and producing the report "Beyond Gridlock" documenting the public concerns and recommendations made at those forums, the ACHP has recently released a final report titled "Is Consensus Possible." Copies of the "Beyond Gridlock" report have been provided to the Subcommittee, and copies of "Is Consensus Possible" are being submitted.

The second major consensus-building effort initiated by AASHTO was establishment of the Transportation Alternatives Group, or TAG. The TAG brought together twelve organizations concerned about national transportation policy as equal partners, to conduct an independent analysis of the nation's surface transportation system and to develop recommendations thereon for consideration by the twelve organizations. The TAG effort was funded to the extent of over $300,000 by contributions from the twelve organizations and many others from the private sector, and employed Stephen Lockwood as Executive Director and its principal investigator. The twelve organizations constituting the TAG are:

American Association of State Highway and Transportation Officials
American Automobile Association
American Public Transit Association
American Public Works Association

American Trucking Associations, Inc.
Highway Users Federation
National Association of Counties
National Association of Regional Councils
National Conference of State Legislatures
National Governors' Association
National League of Cities
U.S. Conference of Mayors

In January of this year, the TAG published is final report titled "Future Federal Surface Transportation Program - Policy Recommendations," copies of which have been provided to the Subcommittee. Mr. Lockwood has now left the TAG, and is currently the Associate Administrator for Policy for the FHWA.

Mr. Chairman, an examination of the TAG and ACHP final reports indicates a significant consensus on a number of key issues before this Subcommittee, including the following:

Federal Role:

"The federal role should ensure preservation of the physical and operational integrity of the major elements of the existing surface transportation system, including highways, bridges and public transportation and should support the nation's economic goals. In addition, the federal program should provide for capacity expansion to improve mobility as well as safety - focussing on addressing interregional and interstate travel needs, relieving urban/suburban congestion, and improving rural access." (TAG Report - page 5)

"The ten most frequently cited federal program objectives are listed below (not prioritized):

1. Provide for the National Defense ...
2. Provide for Interstate Commerce ...
3. Provide Access for All Americans ...
4. Protect Service Levels and Investment in Transportation Facilities ...
5. Reduce Urban and Suburban Traffic Congestion ...
6. Foster Transportation Research and Development ...
7. Stimulate Improved Transportation Planning ...
8. Coordinate with National Energy Policy ...
9. Enhance Transportation Safety ...
10. Help Meet Environmental Goals ..." (ACHP Report - pages 7-10)

Program Content:

"The new surface transportation program should include a renewed federal commitment to a national highway system, public transportation, and an increased emphasis on urban/suburban mobility and rural access. Selected programs should be simplified and consolidated with programs focussed on metropolitan and rural needs." (TAG Report - page 6)

"The national highway system must, at a minimum, include the existing Interstate System and have as a priority the preservation of its desirable physical and operating characteristics. The overall system should result as part of a plan developed by the federal government working in collaboration with state and local governments." (TAG Report - page 7)

"The following highway program areas were seen as needing expanded federal priority by 70 percent or more of respondents to 1988 and 1989 questionnaires sent to ACHP members:

a. Protect the Interstate System
b. Improve the service of arterial roads
c. Reduce urban and suburban traffic congestion
d. Improve road access in small towns and rural areas
e. Enhance highway and traffic safety
f. Protect bridge facilities
g. Develop a system of scenic roadways
h. Increase the Motor Carrier Safety Assistance program
i. Improve access to federal lands
j. Protect against damage from natural disasters" (ACHP Report - pages 11 and 12)

These two examples from the TAG and ACHP reports show the high degree of consensus that exists within these organizations, and between them and AASHTO's recommendations in our "New Concepts" report. Mr. Chairman, we suggest that there is already a strong consensus available to the Subcommittee, as you begin work on the reauthorization of the surface transportation programs.

AASHTO'S HIGHWAY PROGRAM RECOMMENDATIONS

Finally, Mr. Chairman, I would like to provide some background on why our Task Force and the AASHTO Policy Committee are recommending to you the two-component highway program described by President Justice in his testimony, a Categorical Highway Program focused on a new National Highway System, or Highway System of National Significance (HSNS), and a Flexible State and Local Highway Program directed on functionally classified arterials and collectors not on the HSNS, and other highways or bridges which are currently eligible for use of federal aid.

During the 65 public hearings held across the nation by AASHTO's member departments and the ACHP, we repeatedly heard two themes. First, there must be a national highway system, to include the Interstate system, and additional highways sufficient to support interstate commerce and freight and people movements between states and regions. Second, greater flexibility in dealing with all other surface transportation issues and problems is needed, flexibility that will allow states and local governments to tailor solutions to their specific problems.

Turning to the flexibility issue first, our Task Force pondered how best to handle the many requests we received from the public hearings and our member departments. Some simply wanted a federal block grant program, with dollars flowing to state and local governments to spend as they wanted. Our Task Force did not adopt this concept. AASHTO believes that the use of federal dollars on our highway system should serve federal goals, which the traditional block grant will not assure.

Our solution was to craft the Flexible and Local Highway Program set forth in the "New Concepts" report, and described by President Justice in his testimony. The Program would be administered by the states and is centered around providing solutions to a set of Issues of National Significance adopted by the Congress that define the federal goals for the program and establish the parameters for use of the funds. Our Program calls for a state and local government planning process, as appropriate, to produce an annual plan, a plan that would need to describe how it helps solve the Issues of National Significance adopted by Congress and which the FHWA would review and approve. Each year thereafter the states would need to certify that the previous plan had in fact achieved its objectives, as part of the annual planning process. Certification for highway projects should not occur at the individual project level but statewide, which would greatly simplify the red tape problems now found in our state and local highway programs.

This Program would provide the degree of flexibility needed to properly address state and local transportation issues, within the framework of a Congressionally established set of purposes and objectives.

Mr. Chairman, the kind of flexibility provided by our Program is badly needed. We strongly urge the Subcommittee to address this issue, if not in the manner recommended by AASHTO, then in some other way. To quote from our "New Concepts" report regarding the AASHTO recommendations for a flexible highway program, page 3-17:

> "AASHTO is willing to consider the merits of any proposed urban and rural elements which include sufficient flexibility regarding the state and local transfer of funding and priorities among urban and rural needs at state and local discretion."

Let me now turn to our Categorical Highway Program, and the Highway System of National Significance. Our reasoning in recommending the HSNS recognizes the role played by the Interstate System, and the fact that because of demographic and economic shifts in our nation, coupled with varying rates of growth and development, the Interstate System as essentially designed in the 1950s does not well serve all the nation. Simply put, we need a larger National Highway System than the Interstate System.

But at the same time, if we concentrate instead on the over 300,000 miles of Interstate and primary highways in the nation, then available federal aid would be spread very thinly or sporadically; a sound, interconnected, rational National Highway System is not likely to result from this. This approach is not unlike that taken in the first federal-aid highway bill in 1916, when the states were provided with federal funds to use wherever they

wanted. The result was a smattering of highway improvements, with no discernible system evolving. In 1921, Congress changed the federal-aid highway program to concentrate federal resources on a highway system, from which our current primary system emerged.

We believe that with completion of the Interstate System rapidly approaching, the focus of the next highway bill should be on a system larger than the Interstate System, but small enough to assure that national objectives can be achieved. It is from this belief that our HSNS evolved.

An obvious question is, can the states and the FHWA actually designate an HSNS, or new National Highway System? To help answer this, AASHTO and the FHWA worked during 1989 on what might be called a "test run" to see if designation of an HSNS was feasible. While there were problems in some states that would need to be worked out, we found that it was. Our efforts to develop a specific HSNS have now been halted, pending the passage of a new surface transportation bill.

We would note that the FHWA continues its support of developing such an HSNS, and attached hereto is a copy of a recent memorandum from FHWA headquarters to its field offices describing the current status of this work.

Mr. Chairman, I hope that this testimony will help explain the reasoning behind the Association's highway program recommendations. We stand ready to provide any further information the Subcommittee may request.

Mr. Chairman and members of the Subcommittee, this concludes AASHTO's three-part presentation. We again commend you for beginning the process leading toward a new surface transportation bill, and offer our assistance wherever needed.

US Department of Transportation
Federal Highway Administration

Memorandum

Subject: INFORMATION: Updated Principal Arterial System (PAS) and Highway System of National Significance (HSNS)

Date: NOV 14 1989

From: Director, Office of Planning
Washington, D.C. 20590

Reply to Attn of: HPN-12

To: Regional Federal Highway Administrators

At its recent meeting in Atlanta, the AASHTO Policy Committee reached a nearly unanimous consensus on a set of policy recommendations which included the concept of a system of national significance (HSNS). This result was in no small way due to the excellent efforts over the last several months of the States and FHWA field offices to update the functional classifications of the principal arterial system and to develop illustrative highway system of national significance alternatives. The draft maps and related statistics on mileage and VMT were vital to AASHTO and FHWA in identifying the many issues regarding the Principal Arterial System and HSNS.

As part of its approval action, AASHTO adopted the following language:

> "The formal establishment of the Highway System of National Significance should be completed as a cooperative effort between the States and the Federal Highway Administration after adoption of Federal authorization legislation. Consultation should occur with local governments and private sector users as the formal HSNS is defined" (emphasis added).

FHWA does not intend taking any action to formally complete the principal arterial system update or the definition of HSNS at this time. We have made this decision in view of AASHTO's position, the fact that all urban boundaries will be adjusted following the Decennial Census to be conducted next March, and the need for consultation with local governments, MPOs, and private sector users in defining this system. Revisions initiated now would have to be revised in 1991 when Census boundaries become available. In addition, revisions to functional classifications require revisions in HPMS samples. In light of the above, we are recommending that formal functional classification changes and the definition of a system of national significance be undertaken as a single effort in 1991 or 1992.

The full benefits of a system of national significance will only be achieved if appropriate new highway segments are integrated into it. It would be appropriate to review planning studies relating to major urban by-passes, multi-State corridors, urban plan updates, and developmental highway systems to identify candidate new facilities for consideration when planning work resumes.

We anticipate that the AASHTO Task Force on HSNS will remain in existence and FHWA will continue to work with the Task Force to study these and other HSNS issues. The completion of work on the draft updated PAS and the alternative HSNS and related route lists are, however, now unnecessary. Consequently, Chapter 8 of the HPMS Field Manual will be rescinded in the near future. The Manual, "Highway Functional Classification - Concepts, Criteria, and Procedures," revised March 1989, should be retained for future use in a national update of all functional classes based on the results of the 1990 Census.

Although the AASHTO will communicate their action to the States, our field offices should also advise the States of our pending related action on Chapter 8 of the HPMS Field Manual.

We will keep you informed of additional activities.

Kevin E. Heanue

Testimony Of
Richard N. Moseman
of

The Associated General Contractors of America

Presented to the
Surface Transportation Subcommittee
United States House of Representatives
March 13, 1990

On the Topic of
The Post 1991 Surface Transportation Legislation

AGC is:

- More than 32,500 firms including 8,000 of America's leading general contracting firms responsible for the employment of 3,500,000-plus employees;
- 102 chapters nationwide;
- More than 80% of America's contract construction of commercial buildings, highways, industrial and municipal-utilities facilities.

The Associated General Contractors of America
1957 E Street N.W., Washington, D.C. 20006-5199, (202) 393-2040, Fax (202) 347-4004

Mr. Chairman and Members of the Subcommittee, my name is Richard Moseman, of Shasta Management Services in Redding California. I am also this year's Highway Division Chairman of the Associated General Contractors of America (AGC) which represents more than 32,500 firms, including 8,000 of America's leading general contracting construction firms. These contractors perform more than 80 percent of America's contract construction of highways, bridges, commercial buildings, industrial, and municipal-utility facilities, and are responsible for the employment of more than 3,500,000 individuals.

AGC appreciates the opportunity to express its views on the major issues facing the nation in surface transportation. As the nation's leading construction trade association, AGC is vitally concerned with adequate investment in our nation's surface transportation infrastructure to provide the foundation for continued economic prosperity and international competitiveness. AGC applauds this Subcommittee for scheduling these hearings and getting on with the important task of reauthorizing the nation's highway and mass transit programs.

In preparation for the reauthorization of the federal surface transportation programs in 1991, AGC undertook its own policy development initiative in 1988. Recognizing that construction of the Interstate Highway System will be essentially complete in the early 1990s, America is at a crossroads with regard to its future transportation policy. AGC's policy development effort focused on those surface transportation issues which will continue to be important to the nation into the 21st century. In March of 1989 AGC adopted a series of policy recommendations relating to future surface transportation legislation. Following is a discussion of some of the major issues and policy recommendations which AGC believes should be considered as part of the future surface transportation legislation.

TRANSPORTATION'S ROLE IN ECONOMIC DEVELOPMENT

AGC believes that transportation infrastructure is at the very heart of what makes this country thrive and prosper. Over the past 30 years the gross national product of this country has grown over 1,000 percent, nearly double the increase of the previous 30-year period in our history. Several factors account for this growth. One factor, highway development, stands out above all others. America has grown and prospered from the mobility provided by the nation's highway transportation system, in general, and specifically the Interstate Highway System, which was started in 1956. A look at the role of our highway system in our economy will show the magnitude of its effect on current and future economic development.

- 89.5 percent of all personal travel is on highways;
- 82 percent of all freight revenues are carried on highways; nearly every product manufactured or consumed in this country is, for a portion of its journey from production to market carried by truck; and
- 85 percent of America's workers commute to work by private vehicle.

Clearly, highways play a vital role in our economy. No commercial, industrial, retail, or residential development would have been built in a location that did not provide for an adequate highway system to support it.

As development patterns have changed, highways have played an even more important role in this country. Development over the past 20 years has shifted substantially to suburban growth centers. Suburban employment currently accounts for 60 percent of metropolitan jobs, 47 percent of all job destinations, and 67 percent of all job growth in this country. America is increasingly working in commercial buildings, industrial complexes, and shopping centers in suburban areas. None of these suburban developments would have been possible without an adequate highway transportation system serving them.

Increasingly, communities around this country are recognizing the critical link between highways and economic development. Recently, Phoenix voted a multi-billion dollar road development program designed to support the area's rapid economic development. A critical factor in the tremendous building boom in the suburban Washington, D.C., area of Fairfax County, Virginia, has been access to highway transportation. This same link between highways and building is being played out in growth areas across the country.

Unfortunately, some tend to take our highway system for granted. Indeed, like other aspects of our nation's infrastructure, some rarely acknowledge the vital role that highways play in their daily lives, until the highway system breaks down.

There are already signs our highway system is wearing out. The tremendous highway investment made over the past 35 years has been a great success. Our highway network has carried traffic far beyond its design life, as Americans have enjoyed the rewards of mobility unknown to most of the rest of the world. This success, however, has taken its toll as we fail to adequately reinvest in our highway system. Many portions of the Interstate system are in need of repair and reconstruction; nearly 50 percent of the nation's bridges are structurally deficient or obsolete; and congestion on urban freeways is increasing at an alarming rate.

A central question facing the Congress as it begins to develop its future surface transportation legislation is how to ensure adequate investment in the nation's transportation infrastructure to meet current and future demands for economic growth. AGC believes that this nation is seriously underinvesting in its transportation infrastructure, at a great cost to the nation in lost productivity, jobs, and international competitiveness. The nation's transportation system is the arterial system by which the country's economic development is nurtured and supported. If the people of this country, both public officials and private citizens alike, continue to ignore the construction and rehabilitation of this nation's highways, the congestion in the nation's airports and airways, our nation will pay many times over in lost economic opportunity now and in the future.

AGC is joined by a number of others in a concern for the state of the nation's

infrastructure. There is clear and convincing evidence that our abysmally deficient investment in infrastructure is having a negative effect on the future of the nation's economy. The National Council on Public Works Improvement (NCPWI) identified the current lack of infrastructure investment as an issue approaching crisis proportions. In its final report entitled "Fragile Foundations" the NCPWI concluded that the quality of America's infrastructure is barely adequate to fulfill current requirements and insufficient to meet the demands of the future. A major recommendation contained in the NCPWI final report is a call for a national commitment, shared by all levels of government and the private sector, to increase capital spending for infrastructure by as much as 100 percent above current levels.

The Rebuild America Coalition, an organization of 49 public and private associations dedicated to infrastructure investment, published a study in March of 1988 entitled "Increasing Infrastructure Investment: Making America's Economy Competitive Again". That study examined the historic role of infrastructure investment in promoting economic growth and the adverse economic effects of the disinvestment in infrastructure which has taken place over the past 20 years.

Recently, a strong link between public works investment and America's productivity and international competitiveness has been drawn by Dr. David Aschauer, Senior Economist for the Chicago Federal Reserve Bank. In his research, Dr. Aschauer studied the productivity and public investment levels of seven major industrialized nations -- the United States, Japan, West Germany, Canada, France, Italy, and the United Kingdom.

The results of Aschauer's research indicate that nations with the highest savings and investment also have the highest productivity. He concludes that "Public investment, by directly raising productivity as well as by promoting private investment, works doubly hard in enhancing our worldwide competitive position." Recently 327 economists, including six Nobel Laureates, called upon the Congress and the President to increase public investment noting the crucial link between that investment and the productivity needed for a competitive edge.

In as much as transportation is a major component of the nation's infrastructure, AGC believes that the NCPWI findings and the research work of the Rebuild America Coalition and Dr. Aschauer lend strong support to our advocacy of increased transportation capital investment to keep America's economy strong.

AGC Recommendation

AGC urges the federal government to assume the necessary leadership role to promote adequate transportation capital investment by all levels of government.

SURFACE TRANSPORTATION NEEDS AND FUTURE FUNDING

Statistics show that U.S. spending on public works projects has declined significantly as a percentage of total governmental expenditures. In 1950, 19.1 percent

of government expenditures went to public works, by 1984, the figure dropped to 6.8 percent. This comes at a time that U.S. motorists experienced over 700 million hours of delay on highways -- wasting nearly 3 billion gallons of gasoline as a result. The projected congestion of 3.9 billion hours of delay by 2005 is staggering.

The most in-depth analysis of highway needs was performed in 1988 by the American Association of State Highway and Transportation Officials (AASHTO). In their report entitled "The Bottom Line -- A Summary of the Surface Transportation Investment Requirements 1988-2020", AASHTO identified annual highway capital investment needs, by all levels of government, of up to $58.5 billion between now and the year 2020. This compares with highway capital spending in 1987 of only $31 billion.

With respect to mass transit needs, AASHTO's Bottom Line report identified annual capital investment requirements of up to $3.4 billion. Currently, capital investment in transit is just over $2.1 billion annually.

As a follow-on to the Bottom Line report, AASHTO developed and published policy recommendations in a report entitled "New Transportation Concepts for a New Century". While there are a number of policy recommendations contained in that report that are worthy of this Subcommittee's consideration, AGC would like to particularly highlight their recommendation to significantly increase federal funding for the nation's highway program. AASHTO is recommending that highway spending be set at $17.6 billion in FY 1992 increasing to $25.9 billion by FY 1995. As the Subcommittee is aware, highway spending this fiscal year was just over $13 billion.

AGC believes this recommendation recognizes the need to significantly increase highway investment by all levels of government and continues the strong federal role necessary to preserve the nation's Interstate Highway System and meet the other pressing highway and bridge needs. The proposal further recognizes that the federal-aid highway program is a partnership between the federal and state governments, and attempts to maintain the current balance of financial responsibilities by continuing the traditional 40 percent federal share of meeting highway capital needs. In the context of overall expenses -- capital, maintenance and operation costs -- the AASHTO proposal will require states to finance 75 percent of the future highway system requirements. Recognizing that states need some time to develop projects and to come up with matching funds, the proposal phases in growth of the program.

AGC Recommendation

AGC applauds the work of AASHTO as part of the Transportation 2020 program and encourages the Congress to consider AASHTO's policy recommendations on future funding as a sound basis on which to begin debate and build the future legislation.

AGC Testimony before
House Surface Transportation Subcommittee
March 13, 1990

THE CURRENT PROGRAM -- MODEL CONCEPTS FOR THE FUTURE

The challenges facing this country in transportation are immense, but not insurmountable. The federal programs supporting the nation's surface transportation are basically sound, providing a solid framework to address the challenges of the future. As the Subcommittee considers the future surface transportation legislation, AGC believes there are a number of important concepts of the current program which are critical to the success of surface transportation programs in the future. They include:

- User Fee - Trust Fund Concepts - The critical element which has led to the success of the federal-aid highway program is the user-fee financed trust fund mechanism which is used to support them. The trust fund concept has long been recognized as a reliable and stable financing mechanism for infrastructure investment. As early as the 1930s, several states had developed dedicated, user-fee mechanisms to support highway improvement programs in their states.

  By 1956, the year the Interstate Highway Program was initiated, some 25 states had instituted trust funds or similar dedicated funding sources for their highway programs. Using these successes as a model, the Interstate Highway Program was developed around the user-fee trust fund concept. That financing mechanism has served this country well for nearly 35 years, supporting the nation's highway program and the development of the world's greatest public works project -- the Interstate Highway System.

  Several key features of the trust fund are largely responsible for its success. First it is user-fee financed -- the nation's highway transportation system is paid for only by the user. The more you use the system the more you pay. The public support for the highway program has remained strong primarily because the traveling public receives a direct benefit from the money it pays in user fees.

  Another key aspect of the trust fund is that it provides a stable and reliable financing mechanism on which a successful, major capital investment program must depend. A typical highway project may take 7 to 10 years from the planning stage to completion. Proper planning for the transportation needs of the future requires that a dependable source of revenue will be available to finance the needed improvements when they are ready for construction. The multi-year authorization process and contract authority are critical ingredients to permit for this long term planning and assure the highway program's success.

  From the budgetary standpoint, perhaps the most critical feature of the trust fund is the Byrd Amendment which assures its solvency. The amendment provides that on an annual basis, there is a determination of the outstanding obligations and current balance and expected receipts of the trust fund. This information is used to guarantee that future commitments against the trust fund can be honored.

AGC Recommendation

AGC recommends the Congress continue the concept of a user fee financed trust fund to support the nation's federal-aid highway program.

- Maintain the Gas Tax for Transportation Purposes - AGC strongly opposes any diversion of fuel taxes to purposes other than transportation. As discussed previously, the transportation needs of this country are so great, that we cannot afford to divert this revenue source to other government spending. AGC supports an increase in the gas tax if it is dedicated solely to improving the nations highways and bridges.

  In a related issue, AGC believes the Congress should eliminate the fuel tax exemption for gasohol. Purchasers of gasohol, like other highway users, should pay their fair share of the costs of construction and rehabilitation of the nation's highway system. However, since gasohol users pay only one-third of the normal 9 cent per gallon gas tax, they are being subsidized by other highway users. In this fiscal year, the gasohol subsidy costs the Highway Trust Fund nearly $500 million. If pending clean air legislation is enacted with gasohol mandates, the loss to the trust fund could be significantly greater.

  AGC believes that energy independence and clean air are worthy goals, but not at the expense of the nation's highway program. If the gasohol industry truly needs a tax incentive to compete in the marketplace, then other subsidies should be considered by the Congress. The entire nation will benefit from cleaner air and energy independence, therefore, AGC believes the general taxpayer, not the nation's highway program, should bear the responsibility to subsidize the gasohol industry.

AGC Recommendation

AGC recommends that the Congress continue to reject proposals to increase the gasoline tax for deficit reduction or non-transportation spending. AGC supports Congressional efforts to increase funding for the nation's highway program through spending down the trust fund balance, increasing highway user fees, and elimination of the tax exemption for gasohol.

- The Open Competitive Bidding System - The open competitive bidding system has long been the cornerstone of the effective administration of public funds in construction contracts. The nation's highway system, as exemplified by the Interstate system, is an outstanding example of the success of this bidding system. Across this nation, the traveling public utilizes a highway system that was built to quality standards and the public has been assured, through open competition with award to lowest responsive and responsible bidder, that they were obtaining this quality product at the lowest cost to the taxpayer.

Recently, the Federal Highway Administration has indicated a desire to explore alternatives to the standard competitive bidding process as part of an experimental program. This action appears to be motivated by a desire of to minimize problems in contract administration, including inferior performance and excessive contract claims. Whatever the motivation, however, these methods of procurement interject an element of subjectivity into the bid process and circumvent the basic, cost-effective concept of lowest competitive bid.

AGC believes that the open competitive bidding system remains the single most effective means of contracting for highway construction. In instances where concerns about contractor performance arise, there currently exists a number of steps which can be used by State transportation officials to assure a quality project. These steps include: Prequalification; Improved Plans and Specifications; Prebid Conferences; Adequate Inspection; and Preconstruction Conferences. AGC believes these steps, in conjunction with open competitive bidding, assures the taxpaying public of the highest quality project at the lowest possible price and the construction contractor of fairness and integrity in the selection process.

AGC Recommendation

AGC strongly urges continuation of the time-tested, open competitive bidding system -- with contracts publicly advertised, bids publicly received and read aloud, and contracts awarded to the lowest responsive and responsible bidder -- as the means of contracting for federally-assisted highway construction.

- **Equitable Distribution of Funding** - AGC recognizes that one of the most difficult challenges of developing future highway legislation will be devising equitable formulas for the distribution of funding. While the current formulas may not be viewed by all states as equitable, AGC believes that two concepts contained in the current program assure all states a certain level of equity. They are the one-half percent minimum apportionment and the 85 percent minimum allocation provisions.

AGC acknowledges that these provisions may have to take a different form in the future program since certain categories of funding are likely to be revised. However, AGG endorses the overall concept of guaranteeing small and rural states a minimum level of total federal funding to support their highway programs. AGC equally endorses the concept of guaranteeing a minimum level of return of trust fund contributions to states which through the formula process receive significantly less in apportionments than they contribute in user fees.

AGC Recommendation

AGC recommends a continuation, in future legislation, of the concepts of a

guaranteed level of federal funding to small and rural states, as well as a guaranteed minimum return of trust fund revenues to donor states which contribute significantly more in user fees than they receive in apportionments.

CURRENT PROBLEMS -- A LOSS OF PROGRAM EFFECTIVENESS

While the current program has generally worked well, there are a number of policies which are having an adverse effect on the overall program effectiveness. The most damaging policies are occurring as part of the budget process which prevents the timely expenditure of highway user revenues for their intended purpose. No less troublesome, however, are several other aspects of the program which compromise the cost effectiveness of the program. The problem areas include:

- **Budgetary Treatment of the Transportation Trust Funds** - While the trust fund mechanism has worked well in funding transportation programs, the current budget process inhibits the expenditure of the trust fund receipts for their intended purpose. AGC views the trust fund and the highway program in the context of an ongoing capital investment program which should be subject to different rules than the current budget allows. AGC believes the manner in which the transportation trust funds are treated in the budget process needs to be modified.

  As mentioned previously, the highway program is founded on the basis of multi-year authorizations for highway investment. The process recognizes that when a highway project is approved and let for contract, it may be 3 or more years before the final reimbursement for the project will be made to a state and the construction contractor paid in full for the work. For this reason, the user fees paid into the Highway Trust Fund are kept in force for 2 years beyond the final authorization in any highway legislation. This provides the necessary financing for the project at the time the bills need to be paid. Without other artificial spending restraints, such as obligation ceilings, the trust fund can support the highway program with a relatively low cash balance of approximately $2 to $3 billion.

  The budget problems which have faced this country since the late 1960s, however, have had a detrimental effect on the ability of the federal government to let the trust fund work in the manner in which it was intended. Since 1969, artificial spending restraints have caused the Highway Trust Fund balance to grow dramatically to a current balance of over $15 billion, including the mass transit account.

  A first step in addressing this issue would be to expend the trust fund balances for their intended purposes. Since the trust fund receipts can be used for no other purpose than transportation, bankrolling these trust funds is not only a breach of faith with the transportation users of this country, but is merely postponing work that should be done now to prevent more costly repairs later.

A longer term solution to this issue is to take the trust funds out of the unified budget. These programs have not contributed to the deficit. The large cash balances are the very proof of that. The user-fee financed transportation programs of this country should be funded at the level their trust funds can support. The receipts should not be loaned to other programs while vital transportation needs of this country are neglected.

AGC Recommendation

AGC continues to endorse the House Public Works and Transportation Committee's initiatives to take the transportation trust funds out of the unified budget process.

- Special Preference Programs - In conjunction with AGC concerns about preservation of the open competitive bidding system, AGC has an ongoing concern with the continuation of special preference programs within DOT's federally assisted construction programs. Beginning with the Department of Transportation's 1980 Minority Business Enterprise regulations and continuing with the statutory requirements for Disadvantaged Business Enterprise (DBE) participation in the highway, transit, and airport improvement programs which were enacted in 1982 and 1987, AGC is very concerned that the Department's DBE programs are compromising the competitive bidding system.

  Although the notion exists that the apparent lack of minority-owned construction firms proves there has been discrimination in the award of public construction contracts, AGC believes that the open competitive bidding system, by its nature, is race and gender blind. If construction contracts are publicly advertised, bids accepted from all qualified bidders and read aloud publicly, there is no chance that a public agency can discriminate in the award of their contracts.

  AGC Recommendation

  AGC urges the Congress to sunset the current DBE program which results in the denial of subcontracts to many individuals because of their race, gender, or national origin. Instead, the Congress should explore means of promoting the participation of disadvantaged business enterprises in the federal-aid highway program that will not be subject to constitutional challenge.

- Highway program funding sanctions - Over the past several decades, the highway program has been used as leverage to force compliance with other federal mandates. From highway beautification to clean air, there are currently at least 11 different highway program sanctions ranging from withholding project approval to withholding of highway apportionments which may be imposed. Given the pressing need to adequately fund our nation's highway program, it is counterproductive, at best, to impose highway sanctions on states and jeopardize their ability to meet growing highway needs.

AGC Recommendation

AGC recommends that the Congress remove the current sanctions and penalties affecting the highway program and explore alternate means to achieve appropriate state compliance.

- **Federal/State Roles** - As other major changes in the program are considered, it is an opportune time to reassess the current federal/state/local roles in the nation's highway program. AGC believes that the federal/state partnership that has existed in the highway program has generally worked well. AGC believes, however, that a refinement of the federal and state roles should be examined, as follows: There is a legitimate role for the federal government to establish national priorities and conduct oversight of federal expenditures. However, AGC believes there has been too much federal intrusion into state decisionmaking and the administration of the highway program.

AGC Recommendation

AGC recommends the Congress consider a reduced federal role in highway program administration, particularly with respect to project by project decisionmaking, and endorse increased flexibility in program administration by the states.

In closing, AGC acknowledges that the Congress faces a tremendous challenge in balancing interests in the future legislation and stands ready to work with the Congress as it develops solutions to the nation's transportation infrastructure crisis. The immediate challenge is to make transportation a top priority on the national agenda. Only then, can a common political will be mustered to begin to address our critical transportation needs and ensure the future economic growth and competitiveness of this nation.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

KERMIT H. JUSTICE, President
Secretary
Delaware Department
of Transportation

FRANCIS B. FRANCOIS
Executive Director

STATEMENT BEFORE

THE SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

Relating To

SURFACE TRANSPORTATION REAUTHORIZATION LEGISLATION:

FUNDING LEVELS, TRANSPORTATION RESEARCH, HIGHWAY SAFETY, AND RELATED ISSUES

By

HAL RIVES
Vice President, American Association of State Highway
and Transportation Officials
and
Commissioner, Georgia Department of Transportation

Part Two of a Three Part Presentation by AASHTO

March 13, 1990

Founded in 1914, AASHTO represents the departments concerned with transportation and highways in the fifty States, the District of Columbia and Puerto Rico, to foster the development, operation and maintenance of an integrated national transportation system. The active members of AASHTO are the duly constituted heads and other chief directing officials of the member transportation and highway agencies.

EXECUTIVE OFFICE: 444 N. Capitol St., NW, Suite 225, Washington D.C. 20001
Telephone (202) 624-5800 Telefax (202) 624-5806 Telex 4900009580 HTO

Mr. Chairman, I am Hal Rives. I am Vice-President of AASHTO, and Commissioner of the Georgia Department of Transportation. It is my privilege to present to you Part Two of the AASHTO presentation, responding to your request that we provide you with the Association's viewpoints on reauthorization of the surface transportation programs.

In Part One of our presentation, President Justice described the basic recommendations of our "New Transportation Concepts For a New Century" report.

In this Part Two, I want to address four areas. First, I would like to discuss some of the reasoning behind our federal-aid funding levels, as presented by President Justice. Second, I want to direct your attention to some of AASHTO's recommendations with regard to transportation research. Third, I will discuss AASHTO's very recent report setting out a strategic program for highway safety. Finally, Mr. Chairman, I want to address some of AASHTO's policy statements and resolutions that bear directly on the subject matter of this hearing.

AASHTO'S RECOMMENDED FUNDING LEVELS

As President Justice has described, AASHTO believes the highway and public transportation funding levels it is recommending for the next surface transportation program are both reasonable and rational. We take this position because of the methodical manner in which we developed those recommendations.

To review President Justice's testimony, AASHTO believes that the federal-aid highway program funding in FY 1992 should be at a level of about $17.6 billion, rising incrementally over four years to $25.9 billion in FY 1996. For public transportation, AASHTO recommends a federal capital funding level of $3.5 billion in FY 1992, rising incrementally to about $5 billion in FY 1996, along with a continuation of operating assistance at the current level, which is approximately $800 million per year.

Turning to AASHTO's "The Bottom Line" report, copies of which have been filed with the Subcommittee, this document was developed by AASHTO after more than a year's work involving a large number of the top transportation professionals in our member departments. Among the steps leading to publication of the report in September, 1988 were the following:

Highways:

1. A detailed analysis of the statistical information contained in the Highway Performance Monitoring System (HPMS) maintained by the Federal Highway Administration was made by transportation professionals in our member departments, during which:

    a. The extent and validity of the data, which is collected from our member departments, was examined, and strengths and weaknesses determined.

b. A number of computer runs were made of different combinations of information, to develop the first drafts of Tables 2.1 through 2.5 of "The Bottom Line" report, and the first drafts were then examined by our member departments and discussed at length. From this exercise, the final versions of the Tables were developed and approved.

2. Recognizing that the HPMS data relates only to existing highways, and that even here there are weaknesses in the information, the AASHTO committee working on this project proceeded to survey our member departments seeking additional information about their highway programs. Efforts to survey local government needs were also undertaken, which produced useful information even though data on local government highway and roads systems is very difficult to obtain. From this and other information, an estimate of the scale of needed highway improvements beyond what is contained in the HPMS was made.

3. With all available information in hand, the Task Force on a Consensus Transportation Program reviewed the results and made determinations on national needs. Throughout this process, a close working relationship with the FHWA was maintained.

Public Transportation:

1. A special committee of our Standing Committee on Public Transportation collected available information on transit funding and requirements from our member departments, the Urban Mass Transportation Administration and the American Public Transit Association, and assembled a basic set of tables showing projected requirements in large, medium and small urban areas, and in rural America.

2. The collected data was analyzed utilizing nationally-developed criteria, and the results were reviewed by transit experts in our member departments.

3. Finally, the Task Force on a Consensus Transportation Program reviewed the data, and the conclusions drawn therefrom.

Modal Interlinks:

1. After determining that no reliable data was available with respect to needed linkages between airports, harbors and railheads and the nation's highway and public transportation systems, a committee surveyed our member departments with respect to interlink needs.

2. The results of the survey were analyzed, and from this the first-ever national estimate of need was made, resulting in the findings on pages 39-42 of "The Bottom Line" report. Again, the information was reviewed by the Task Force.

With respect to the Task Force on a Consensus Transportation Program, which as Director Miller will describe was comprised of chief administrative officers from across the nation, the Task Force went beyond the statistical data to consider a number of other factors before making funding level recommendations. For example, a task force from the Standing Committee on Highways studied expected changes in highway engineering over the next few decades, and the implication of those changes on the needs of our highway system. A professional review was also made of a number of issues that can impact funding requirements, in the following areas:

- Improved Materials and Services
- Operational Changes
- Privatization
- Demand Changes
- Traffic Management

Brief findings from the examination of these areas are found on pages 43-45 of "The Bottom Line" report.

It was only after this work was accomplished that AASHTO made a determination on recommended funding levels for the federal-aid highway and public transportation programs. The discussions leading to AASHTO's recommendations also looked at historical information in the federal-state relationship, the purposes of the highway and public transportation programs, the federal interests served by these programs, and the goals, objectives and federal role principles developed by AASHTO's Task Force.

The types of needs on America's highways of course vary, particularly as between urban and rural. In "The Bottom Line" report these differences are discussed, and the two pie charts on page 24 graphically illustrate the situation. In rural America the largest need is for resurfacing and pavement reconstruction, reflecting older highways that have not received their full share of attention in recent years. For urban America, the greatest need is for widening type work, to accommodate requirements for new capacity.

Mr. Chairman, I trust this explanation will help explain why AASHTO believes its recommended funding levels are sound. The work AASHTO has done parallels to a great extent the findings of the Federal Highway Administration for the nation's highways, and is generally accepted by other experts, except by some who hold our funding levels may be too conservative.

To help place our funding recommendations in perspective, it might be helpful to review some basic information about changes in America's highway system between 1967 and 1987. During this 20 year period:

- Surfaced highway and road mileage - Up 25 percent
- Licensed drivers - Up 55 percent
- Motor vehicle registrations - Up 95 percent
- Vehicle miles of travel - Up 105 percent
- Total highway disbursements - Up only 8 percent, in constant dollars

Mr. Chairman, it is the last item on this list that is at the root of our problems. It is true that both the federal government and our state and local governments increased highway program revenues over this 20 year period, in some states through several motor fuel and other user fee increases. But because of delays in legislative action these revenue increases have usually lagged behind inflationary cost increases. Overall, the nation's total expenditures for highways have increased from $16.669 billion in 1967 to $66.385 billion in 1987, in current dollars, or about 298 percent. During this same period the highway maintenance and operations cost index maintained by the FHWA increased by 305 percent. But at the 1987 expenditure level of $66.385 billion, America is simply not keeping up with the national growth in traffic, and the rehabilitation costs of an aging highway system and its 571,308 bridges.

Of the many issues facing America, transportation is one that we can do something about - if we have adequate funding. We believe that the federal funding levels AASHTO is recommending are reasonable, and that they will help to keep America moving.

AASHTO'S TRANSPORTATION RESEARCH RECOMMENDATIONS

Mr. Chairman, it is a fact that over the past decade our nation has spent less - much less - on transportation research than any of the other leading industrial nations. In the United States spending for research in the highway industry is about 0.2 percent of our highway expenditures, lower than the average in even our most basic low technology industries, which on the average spend more than eight times as much as we do on highway research. We believe this situation must be remedied, if we are to properly address the highway and other transportation problems facing America.

Over the past several years AASHTO's member departments have become more involved with and supportive of transportation research, recognizing the role it can play in helping to meet our transportation needs. In the 1980s AASHTO gave leadership to establish the Strategic Highway Research Program (SHRP), which the Congress strongly supported and funded in the 1987 Act. Recently, we created a new Standing Committee on Research, and gave it a broad charge to provide leadership in this increasingly important area.

As part of AASHTO's Transportation 2020 effort, the Standing Committee on Research developed the most comprehensive report on the status and needs in transportation research every produced. Titled "Innovation," the report was endorsed by the AASHTO Policy Committee, and copies have been provided to the Subcommittee. Based on this report, AASHTO adopted a number of specific recommendations, which are included in Chapter 6 of the "New Concepts" report.

Mr. Chairman, I would like to emphasize some of AASHTO's transportation research recommendations, while directing your attention both to the complete list of recommendations in the "New Concepts" report, and the backup material in the "Innovations" report.

38-253 O—91——14

AASHTO believes that:

- The Long Term Pavement Performance (LTPP) component, and some other continuing research projects, of the SHRP program should be supported in the next surface transportation legislation.

  The important LTPP research program requires another 15 years to gain the full benefits it promises. In a recent survey of our member departments there was strong support for continuing this research, and for conducting it in a manner that will assure: continued top level involvement of our member departments; integrity of the research program; availability of a capable, dedicated research staff; and establishment of an implementation program to place the results into practice.

  The National Academy of Sciences (NAS) has indicated it will not be available to manage this continuation of the SHRP program, but that it will lend its presence to help assure the continued integrity of the research. What is necessary is legislation that will assure adequate funding, and which will enable AASHTO, the NAS and FHWA to enter into an operational agreement that will give the assurances needed by all three parties for a successful conclusion to this effort.

- Overall, the funding provided to support transportation research and technology transfer activities should be substantially increased, to perhaps double current levels. The federal government has a long tradition of supporting transportation research, reaching back to 1893 in highways, and its leadership and funding support is vital.

- A major public-private research effort on intelligent vehicles and intelligent highway systems (IV/HS) should be undertaken, so that the benefits of technology can be applied to solving our congestion and highway safety problems.

  The United States currently lags far behind both Europe and Japan in this important research area. AASHTO is working with industry and the Federal Highway Administration to develop plans for a public-private effort that will put the United States in its rightful leadership position on IV/HS, and the next surface transportation bill should include strong federal support.

- A research program for public transportation should be established, perhaps patterned after the highway research program, and intermodal research should be encouraged.

HIGHWAY SAFETY

Mr. Chairman, the issue of improving the safety on our highways continues to have a prominent place on AASHTO's agenda. We have made some

progress in recent years in reducing the mortality rate on our highways, but we feel that we need to do more.

Over the past year our Standing Committee on Highway Traffic Safety has been developing a "Highway Safety Strategic Plan 1991-2000." When our Policy Committee met on February 23, 1990, it accepted this Plan by more than a two-thirds vote as a working document, from which to develop recommendations to further improve safety on our nation's highways. AASHTO will shortly be publishing this Plan, and copies of the report as considered by our Policy Committee are being provided to the Subcommittee.

The Plan suggests a proposed annual authorization in the range of $1.465 billion for highway safety, an increase of $940 million over the amount of federal safety funds in the reauthorization Act of 1987. It states that "While the fatal accident rate has been declining over the past several years, total highway deaths have been steadily climbing since 1983." If trends continue:

- Over 500,000 Americans will perish on the nation's highways;
- Over $1.2 trillion will be lost in highway accidents; and
- One in every 19 children born this decade will die, be permanently disabled or suffer a life-threatening injury in a highway accident during his/her lifetime.

Mr. Chairman, as this Subcommittee is aware and as our Standing Committee on Highway Safety recognizes, accident prevention is a complex issue. The Plan identifies 19 specific safety strategies to be addressed in the areas of people, vehicles, highway environment, post accident, and safety management. In each of the strategies the report identifies opportunities which have the potential to reduce the frequency or severity of future accidents.

The ten major areas of recommendations in the report address:

- Safe Driving Performance
- Improved Pedestrian Safety
- Corridor Safety Improvements
- Improved Highway Safety
- Enhanced Vehicle Safety
- Safe Commercial Motor Vehicle Operations
- Vehicle Crash Avoidance
- Enhanced Rural Emergency Medical Services
- Strategic Research for Safety
- Safety Management

Mr. Chairman, I want to make clear that AASHTO is not endorsing ten separate safety programs in the highway portion of the next surface transportation program, or safety program funding levels precisely as stated in the Plan. Rather, we believe that highway safety should be an eligible item for expenditure in both the Categorical Highway Program and the Flexible State and Local Highway Program, centered around these ten areas. It should

be left to each state to devise its own specific safety program, designed to fit the conditions and needs of that state.

AASHTO is strongly committed to improving safety on our nation's highways, and we offer the suggestions in this new AASHTO report for your consideration.

RELATED ISSUES

Mr. Chairman, I would now like to address a number of related issues that AASHTO believes are important in considering surface transportation reauthorization legislation.

The Highway Trust Fund

As the Subcommittee knows, over the past few years AASHTO has repeatedly expressed its concern about the future of the Highway Trust Fund, and has approved and forwarded to the Congress several policy resolutions relating to this issue.

The Association is committed to the user fee concept for supporting transportation programs, strongly supports continuation of the federal Highway Trust Fund, and believes it should be made permanent.

We also believe that the balance in the Highway Trust Fund should be utilized for the purposes for which the revenue was collected, including the accumulated interest on funds contributed by the nation's highway users. We also strongly oppose using transportation user fee revenue for any other purpose than transportation, such as reducing the federal deficit. Like this Subcommittee, we want to put "trust back into the Highway Trust Fund," and we strongly applaud your efforts toward that end.

Finally, the Association believes that the gasohol exemption from the federal motor fuel tax should be ended, especially if in the process of enacting Clean Air legislation gasohol fuels become mandated in some metropolitan areas. In addition, every effort should be made to eliminate the raiding of motor fuel tax revenues by organized crime. These actions could result in from $1 to $2 billion additional being available for America's highways, according to reliable estimates, without any increase in the levels of taxation.

Toll Roads and Bond Financing

While our "New Transportation Concepts For a New Century" report does not specifically mention toll roads, current AASHTO policy does. Specifically, the following two policy statements represent the Association's current position on toll roads:

> "H37 State transportation agencies should be permitted to develop new toll highways in conjunction with use of federal funds on federally aided projects, as they are now permitted to do with regard to toll bridges and toll tunnels."

"H38 The Secretary of Transportation should be granted the authority to allow the imposition of tolls on federal aid highways where uniquely high maintenance, construction or reconstruction costs exist. There should be no obligation to repay federal-aid highway funds which may have been expended on the facility."

Tolls are one mechanism for state and local governments to use in responding to highway needs in certain situations. The option for their use should be available, and federal law should enable this.

AASHTO also believes that federal law should encourage, not discourage, the use of bond financing. Effectively utilized, bond financing can reduce the overall cost of transportation facility construction during an inflationary period, and can result in projects being placed in service much sooner than would otherwise be possible, resulting in economic benefits to the users. We support other state and local governmental organizations in urging that the Congress not unduly limit the availability of bond financing.

Sanctions

It has been and continues to be AASHTO policy that sanctions should be avoided, as a tool to seek state compliance with federal goals. In the end they are counterproductive, and can deny the federal funds that are needed to alleviate the very problem being sanctioned. Often the issue subject to sanction is one that is not in control of the highway agency, which makes it impossible for the affected agency to remedy the sanctioned situation.

AASHTO does support incentives, as a far better tool than sanctions for achieving national policy goals.

Environmental Regulation

Like all Americans, AASHTO's members are concerned about clean air, preservation of wetlands, and related environmental matters. But at the same time, we also know from experience that environmental regulations are advanced by those unfamiliar with meeting transportation requirements, and who do not take necessary trade-off issues into account.

We support rational environmental legislation, as we know the member of this Subcommittee do. We urge that pending Clean Air and other environmental legislation be carefully reviewed by the Subcommittee, however, from the standpoint of its impacts on the transportation programs within your jurisdiction.

Scenic Byways

Mr. Chairman, a number of organizations have expressed support for adding a scenic byways element to the next surface transportation legislation. The Association does not believe that a separate scenic byways category of funding is appropriate or required in the federal-aid highway program. Currently, scenic highways are already eligible for the categories of primary

and secondary federal-aid highway funds, and the AASHTO State and Local Highway Program would provide a mechanism in the future to accommodate such facilities.

AASHTO does support the updating of the national scenic road study. We also support securing of states' exclusive authority in scenic route designation, and preservation of the state's authority for the selection and construction of improvement projects receiving federal-aid highway funds within existing environmental constraints and system categories.

Summary

Mr. Chairman, I trust that this testimony will be of help to the Subcommittee. I have not, of course, addressed all the issues that will be before you during the reauthorization process. As President Justice has said, we stand ready to respond to questions or to provide further information at any time.

In closing, let me also commend the Subcommittee for initiating the surface transportation reauthorization process with these hearings. We in reality have a short time before the expiration of the current highway and public transportation programs on September 30, 1991, and we are very pleased to see progress being made.

TESTIMONY
OF
ALAN SMITH
EXECUTIVE VICE PRESIDENT
GENERAL MOTORS CORPORATION
AND
CHAIRMAN
HIGHWAY USERS FEDERATION FOR SAFETY AND MOBILITY
TO THE
SURFACE TRANSPORTATION SUBCOMMITTEE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES

ON THE
REAUTHORIZATION
OF THE
FEDERAL-AID HIGHWAY PROGRAM

MARCH 13, 1990

Mr. Chairman, my name is Alan Smith. I am Executive Vice President of the General Motors Corporation and Chairman of the Highway Users Federation for Safety and Mobility. With me today is Lester Lamm, President of the Federation. We are very pleased to be here and appreciate the Subcommittee's early attention to the very important issue of surface transportation legislation reauthorization.

The Highway Users Federation is a national coalition of businesses, industries and associations, working to improve the safety and efficiency of America's highway transportation system. Our membership consists of more than 400 companies and associations representing 27 industrial and commercial categories, 63 state and local conferences, and 2,000 individual members. Our members, in turn, speak for more than 30 million commercial and private users of the nation's highway system.

The Federation's members comprise the largest group of highway users and suppliers of highway services and products. By their highway usage, this group also represents the primary source of income for the Highway Trust Fund. In other words, our members are the principal payers of state and federal highway user fees.

GM involvement in the Federation

General Motors has been a supporter of the Highway Users Federation and its predecessor organizations from the beginning. Alfred P. Sloan, GM's Chairman for nearly two decades, helped found the National Highway Users Conference in 1932. He remained the Conference Chairman until 1948 and was succeeded by several GM executives.

GM has continued its high-level involvement in the Federation. My participation with the Federation started in 1981. I have served as Treasurer, Vice Chairman, and am now Chairman. Roger Smith (GM's current Chairman) was active in the organization as well for several years.

GM dependence on effective transportation

As our commitment to the Federation demonstrates, GM is as interested in the use of cars and trucks as we are in their production. Albert Bradley, a leader of the highway user community and Chairman of GM, said in 1951 (and these words are still true today):

> "We may think we sell cars and trucks. But what we are really selling is mobility. Our cars and trucks must be well designed and well built, but if they cannot be used efficiently and enjoyably, they will be of no more value than a canoe in the desert."

Our participation in the Highway Users Federation is only one example of our long interest in the transportation and highway system. GM's exhibit at the 1939 New York World's Fair -- Futurama -- demonstrated our perception of the highway system of the future. Our visionary model was a precursor to the Interstate Highway System and suggested ideas now included in current transportation technology. GM is now looking to the future as a U.S. leader in the development of intelligent vehicle and highway systems -- so called "smart cars."

GM is concerned about more than future technology in highway use. We have also contributed to safer roadway design and highway systems. For example, GM pioneered the concrete median barrier now widely used on our highway system. We also helped develop shear-based utility poles, breakaway traffic signs, and the "forgiving highway", with wider right-of-way and a gradual recovery slope to eliminate drainage ditches. All of these GM efforts worked to assure safer roadways.

As the world's largest supplier of vehicles and also one of the largest shippers, GM takes a keen interest in the nation's transportation system. An efficient, effective transportation system is vital to the production and distribution of our vehicles and service parts.

General Motors has 141 facilities in the U.S. that ship or receive component parts, raw materials, and/or finished vehicles. We are the largest customer of many U.S. motor carriers -- spending nearly $2 billion dollars annually. Good access to safe, well maintained highways is vital to our remaining competitive in an expanding world market.

Of the 141 facilities, 29 are car and truck assembly plants located throughout the U.S. A typical plant receives and unloads an average of 120 truckloads of component parts and supplies daily. The plant then ships approximately 480 vehicles (one-half of its daily production) direct to dealers using 60 haulaway trucks. An additional 480 vehicles leave the plant site loaded on multilevel railcars destined to rail unloading ramps located in major market areas. Upon arrival, the railcars are unloaded and the 480 vehicles are delivered to dealers by another 60 haulaway trucks.

Through the process just described, approximately 240 trucks are required to support the daily activity of a typical assembly plant (material and supplies inbound, finished vehicles outbound). Taken in total, approximately 7,000 trucks provide daily support to our 29 assembly plants. We estimate that an additional 7,000 trucks are involved daily when GM's manufacturing and stamping plants are considered.

General Motors dependence on effective highway transportation has increased substantially during the past decade. On any given work day, trucks carrying GM materials or finished vehicles are operating on the streets and highways of all 50 states.

The percentage of our transportation dollar spent in the U.S. for motor carrier service has increased from 45 percent in 1979 to 56 percent in 1989. Much of this increased dependence upon highway transportation is the result of efforts to remain competitive. The GM quality network production system is being used to facilitate the shipping of components "just-in-time" to meet very precise production schedules.

One goal of "just-in-time" is to minimize in-plant inventory and in-transit inventory. Making smaller, more frequent shipments is a method used to control and reduce in-plant inventory. Likewise, in-transit inventory can be minimized by reducing the time shipments are in transit. Motor carrier transportation is generally faster than rail. Consequently, business that was traditionally thought to be rail captive is now handled over the highway. Speed, consistency, and reliability are all factors in this transition.

As stated earlier, we estimate 14,000 trucks on the highway support GM's daily business. If the trend of the last few years continues, we can expect even greater reliance on a sound highway system.

GM believes that a good, safe highway transportation system is the cornerstone of our economic future and necessary for a successful competitive position. Virtually all American business and industry depends on a safe, efficient highway system. In 1987, highway freight and passenger transportation expenditures accounted for 15 percent of GNP. This represented $814 billion -- a clear statement of the importance of the highway system to the total U.S. economy.

I will now ask Lester P. Lamm, Federation president, to briefly describe the Future Highway Program we recommend.

The Federation 9-point program proposal

The Federation has developed this 9-point highway program proposal to reflect the concerns expressed by the public in 65 public forums, and look to new approaches and technologies that address both today's problems and those we expect in the future. We would like to briefly review the program; a comprehensive written summary is provided for the Subcommittee's review.

The Federation proposes a four-year reauthorization with annual funding of $22.9 billion for federal-aid highways and transit through 1995. We believe these funding levels can be supported without an immediate increase in user taxes, if balances in the Highway Trust Fund are used for their intended purpose and the special tax treatment of gasohol is eliminated.

1. Protect the Interstate System

Over the past 35 years, the United States has invested more than $133 billion to create the Interstate Highway System. Interstate highways carry more than 22 percent of all travel, though they consist of about one percent of the nation's road system.

The physical and operational condition of the Interstate System must be kept to a very high level through an ongoing program of restoration, rehabilitation, resurfacing and reconstruction. The Federation recommends that completion of the system be fully funded and an additional annual federal-aid commitment of $4 billion for these activities.

2. Create a National Arterial System

Another three to four percent of the nation's highway system carries another 30 percent of vehicle travel. A program is needed to upgrade these priority routes with safer designs, controlled access and additional lanes where needed and bypasses and arterial roadways in growth areas.

The Federation urges the maximum use of new engineering techniques to make travel on this National Arterial System safer and more energy efficient, help to reduce traffic congestion and help to improve urban air quality. The Federation recommends an annual federal-aid budget of $6 billion for this program.

3. Restore Metropolitan Mobility

Throughout the U.S. there are areas where billions of dollars have been invested in homes, offices and factories but not enough in needed transportation infrastructure, including roads, bridges, parking facilities, traffic control facilities and public transit.

The Federation proposes a five-fold increase in the federal commitment to helping people "get around town" through a Metropolitan Mobility Program for areas with populations over 50,000. This would be a different type of program, reducing red-tape by allowing local authorities more flexibility to spend the funds on any surface transportation capital investment, provided that investment fits into a 10-year development plan developed locally and approved by the state. We feel this would reverse the past trend toward under-investment in transportation infrastructure and improve urban mobility.

The Federation recommends annual federal funding of $4 billion for these efforts from the Highway Trust Fund, coupled with $3 billion per year from general funds for high cost transit programs such as subway systems.

4. Connect Rural America

Access to major highways is critical to millions of Americans living on farms and in small cities and towns. Although daily traffic mileage on these non-arterial roads is small, the total sum of rural road mileage is large. These roads are vital to the distribution of produce from the nation's agricultural sector to consumers throughout the country.

Local governments cannot provide for our rural mobility needs alone; major assistance is needed to keep rural roads and bridges safe and serviceable. The Federation recommends the establishment of a Rural/Small City Program to support highway or public transportation improvements in rural areas and cities with populations below 50,000. The projects would be selected by local officials, following state-approved long-range improvement plans. federal-aid funding for this program should be $2 billion annually.

5. Keep Bridges Safe

Bridges are vital to all our road systems and the members of this Subcommittee are very familiar with the vast number of America's bridges which are outmoded, obsolete and increasingly unsafe.

The Federation proposes a state-managed bridge program which would use federal-aid funds to ensure that all highway bridges receive proper inspection, maintenance and rehabilitation or replacement, regardless of what system they might be on. We recommend annual federal-aid funding for this effort of $2.5 billion.

6. Improve Traffic Safety

The United States has the lowest highway fatality rate for travel of any industrialized nation in the world: 2.2 deaths per 100 million miles of travel. The number of traffic fatalities, exceeding 45,500 in 1989, is still too high.

While each of the elements of our proposed highway program would bring additional safety benefits, additional federal funding is justified to eliminate roadside hazards, improve signs, signals and markings, and to support non-engineering activities such as safety belt and child safety system use, alcohol and drugged driving countermeasures, driver education, traffic law enforcement and the regulation of commercial vehicles.

Speaking of safety belt use, the Federation and the auto industry, working with Traffic Safety Now, are proud of the role we played in bringing about passage of state safety belt use laws throughtout the country. These laws are now in effect in 33 states and the District of Columbia, and the increased safety belt use they have produced has been credited with saving more than 10,000 lives. More can and should be done to increase enforcement of safety belt laws, and to bring about their passage in those states which do not have them. In this regard, we support the Administration`s goal of increasing belt use from the current level of just under 50 percent to 70 percent by l992.

7. Research and Development

Research can provide major dividends in the form of better highway operations and safety. We realize it is not possible in all cases to address traffic congestion through the addition of more lanes. We will have to augment traffic capacity through the use of new technologies which allow the road system to be used more efficiently and make it safer for all drivers.

The Federation recommends the establishment of a 10-year public/private development program dedicated to putting smart cars on smart roads, which will provide drivers with electronic aids to warn of hazards, give locations and provide destination headings in all weather and traffic conditions. The focus of this program should include the research and development of new technologies but also place as much emphasis on the implementation of current technology wherever possible. We recommend an annual federal budget of $100 million per year for the smart car-smart road program, to be matched by the commitments of private industry in a ten year program. Other FHWA research activities should also be expanded.

8. Develop Scenic and Public Lands Roads

Millions of acres of scenic and public lands should be opened to the American public and foreign visitors through the environmentally-sensitive development of recreational highways.

Tourism is a major source of income for many states and we recommend that the existing programs for the development of park, parkway, public land and scenic/recreational routes be closely coordinated with our suggested rural and arterial highway programs. The nation needs a coordinated program of scenic roadways to enhance tourism. Greater access to the nation's mineral, livestock and timber resources is also needed through the development of ecologically benign roads to remote areas. The Federation recommends $300 million in annual federal funding for the federal lands access efforts. The scenic roads program should be eligible for all regular federal-aid programs, rather than having a new program of specific funding.

9. Assure Better Planning

The $22.9 billion in total federal expenditures recommended under the Federation program demands more and better coordination of transportation and private

development decisions to assure that both support community goals. This is a process which has failed too often in the past. It must be improved without eroding the rights of local citizens to decide their own development futures.

State and local planning should be strengthened by this proposal and federal-aid transportation projects would have to conform to an established long-range plan meeting specific, locally set development goals and priorities. This effort would be funded by an increased percentage of highway and transit program funds.

Funding Recommendations

While recommending higher expenditures for highways in order to meet existing and future highway needs, the Federation is not suggesting a change in the historical proportions of federal, state and local funding; that is, roughly, 25 percent from the federal government, 50 percent from state governments, and 25 percent from local governments.

We believe our recommended programs and funding levels can be supported through 1995 without any additional federal highway user taxes. It would require that current funds available in the Highway Trust Fund be fully utilized, elimination of the excise tax exemption for gasohol (almost $500 million in 1989), making full use of the interest earnings of the Trust Fund (more than $1 billion annually), and drawing the balance of the Highway Trust Fund down over the reauthorization period to a reasonable level of $2 to $3 billion. We believe any proposals to increase federal highway user taxes should be deferred until the present excessive Trust Fund balances are drawn down, and the funds productively used for their intended purposes. State and local governments can use this four-year "window" to reexamine and adjust their user fees if necessary to fund their portion of an expanded program.

The Federation recommends a minor departure from the existing requirements for state matching funds on highway projects. We would establish a standard 25 percent state (or

local) matching requirement with the following exceptions: limited access projects (15% state/85% federal), safety activities (0% state/100% federal) and safety construction projects (10% state/90% federal). Matching requirements in states with large federal land holdings should be reduced, as is the current practice.

Funds should continue to be apportioned to the states on the basis of simple and equitable formulas, and the states should receive no less than 90 percent of the funds their citizens contribute to the Highway Trust Fund.

We congratulate you, Mr. Chairman, and members of the Subcommittee, for your leadership in reserving transportation fees for transportation purposes. We have been pleased to help gain the support of more than half of the House membership in opposing the concept of fuel taxes for non-transportation purposes as expressed in House Resolution 41.

Transportation 2020

In developing the Federation's highway program proposal, we have relied heavily on information developed through our participation in several major consensus-building efforts -- Transportation 2020, the Advisory Council on Highway Policy (ACHP), and the Transportation Alternatives Group (TAG). We believe our proposal is entirely consistent with the positions developed in these other efforts.

The Transportation 2020 process, led by the American Association of State Highway and Transportation Officials (AASHTO) and the Federation, sought to identify the surface transportation policies that the national economy will need in the year 2020. This effort consisted of a series of 65 public forums, conducted throughout the U.S. in 1987 and 1988.

The Advisory Council on Highway Policy (ACHP), a subgroup of Transportation 2020 which includes more than 100 organizations interested in transportation, was established to

conduct the public forums, evaluate policy options, and begin the consensus building process.

The ACHP has developed a consensus on a wide range of policy issues as shown in the responses to a group survey in late 1989. Of 67 specific questions relating to the future highway program, 49 were supported by 70 percent or more of the respondents. The questions and responses are contained in the attached report of the ACHP, "Is Consensus Possible?" We commend this report and its recommendations to the Subcommittee. In our opinion, the proposals represent good public policy.

The Federation also participated in the Transportation Advisory Group (TAG), a coalition of public and private interest groups which developed a series of consensus policy recommendations that provide another valuable asset for Congress' consideration as the reauthorization process moves forward.

Mr. Chairman, this has been a brief summary of the Federation's specific legislative proposals. Our Chairman, Mr. Smith, has a few closing comments.

Federation reaction to DOT policy

We were pleased by the recent White House release of the National Transportation Policy, an event that all of us in the transportation community had been eagerly awaiting. Secretary Skinner is to be commended for completing this process, and helping to move transportation to a higher position on the nation's policy agenda.The findings of the DOT's public outreach effort confirmed much of what the Federation and others found through the Transportation 2020 process in 1987 and 1988. A more detailed reaction is contained in the enclosed Federation summary to its membership. We specifically commend the Administration for recognizing the need to invest in America's transportation and for the promise to "fully use the funds that people have paid in transportation user charges for

investments in transportation." Our private sector members completely support the concept of greater public, private cooperation for a more effective future highway program. We will do our part to make this work.

The need for early, effective action on the highway bill

Mr. Chairman, we have already reviewed the efforts of the surface transportation community to document the nation's transportation needs and develop the remarkable degree of consensus for action which now exists as you begin the legislative process towards reauthorization.

These efforts have been made with the aim of reducing the number of conflicting issues which will be brought to your attention in the coming months.

The nation is poised to move forward in protecting and enhancing our surface transportation system. We have seen several unusual occurrences which bode well for our efforts in the next several months;

* the successful development of a consensus in the transportation community regarding those issues of greatest importance to the nation,

* the release of the National Transportation Policy, which provides a unified framework for improving all of our national transportation modes, and,

* the high degree of interest which highway legislation enjoys in Congress, coupled with the broad experience and knowledge of the Subcommittee members and staff.

But we are very pleased by these events and happy to see the reauthorization process underway. But we are also concerned that issues already under Congressional consideration

-- such as the revision of the Clean Air Act, or recurring notions for a gasoline tax to fund non-highway activities, may move forward in the near future and preempt our efforts to develop a thoughtful and comprehensive highway measure by limiting individual mobility, altering the basic financing structure of the Highway Trust Fund, or tapping directly into traditional sources of highway revenues.

The need for government/private sector cooperation

By virtue of our diverse membership, which includes private and corporate interests, and our strong ties to state and federal highway program managers, the Highway Users Federation is in a unique position to review the current program and offer suggestions regarding the next highway bill.

The Federation welcomes the opportunity to serve as an interface between public and private interests in developing an even stronger cooperative approach for the future national highway program. For example, the Federation, in conjunction with General Motors and the Department of Transportation, is sponsoring a leadership conference this May on the implementation of Intelligent Vehicle Highway Systems. This event, to be held in Orlando, Florida, will bring together the business and government policy-makers who will actually put such technology into production and use. Rather than focusing on the technical aspects of IVHS systems, this conference is intended to develop a systematic plan for the implementation of existing technologies and those which will become available in the future.

We hope this event will provide a model for future cooperative efforts to address other major issues facing the highway program.

We offer you the full cooperation and resources of the Highway Users Federation in the coming months. We are actively working to heighten the nation's awareness of highway needs at many levels, from individual drivers to the officers of corporate America. We know that all

Americans are all dependent on safe and reliable transportation for our health and welfare and a growing economy.

Mr. Chairman, we appreciate this opportunity to review the Federation's highway program proposal with you and we would be pleased to answer any questions you might have.

STATEMENT OF MS. JUDY WRIGHT

THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS
BEFORE THE SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
March 13 1990

THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS (SCAG) APPRECIATES THE OPPORTUNITY TO SUBMIT THIS TESTIMONY WHICH ADDRESSES ONE OF THE MOST IMPORTANT ISSUES DETERMINING THE QUALITY OF LIFE IN SOUTHERN CALIFORNIA -- THE FEDERAL, STATE AND LOCAL ROLES IN THE FUNDING OF POST INTERSTATE HIGHWAY AND TRANSIT PROGRAMS.

SCAG IS THE LARGEST METROPOLITAN PLANNING ORGANIZATION IN THE UNITED STATES WITH A PROJECTED POPULATION THAT WILL EXCEED 18 MILLION BY 2010. THE REGIONAL MOBILITY PLAN DEVELOPED BY SCAG IN COOPERATION WITH PRIVATE SECTOR REPRESENTATIVES AND EFFECTED COUNTIES AND CITIES REFLECTS THE INTEREST OF THE REGION IN ENSURING ADEQUATE FUNDING FOR ENHANCED MOBILITY, IN INCREASING THE EFFICIENCY AND FLEXIBILITY OF THE FEDERAL PROGRAM TO FUND PROGRAMS ON DIFFERENT SYSTEMS AND FOR DIFFERENT MODES, AND IN THE EXPANSION OF EFFORTS TO DEVELOP IMPROVED TECHNOLOGIES.

AT THE OUTSET, WE WOULD LIKE TO APPLAUD THE EFFORTS TO DEVELOP A COMPREHENSIVE NATIONAL TRANSPORTATION POLICY. WE SUPPORT A GREATER LOCAL, REGIONAL AND STATE ROLE IN PLANNING TRANSPORTATION, A GREATER PRIVATE SHARE OF THE INVESTMENT IN TRANSPORTATION, AND A STRONG FEDERAL EMPHASIS ON SAFETY AND RESEARCH. WE AGREE ALSO ON THE NEED TO MAKE BETTER USE OF AVAILABLE RESOURCES AND FACILITIES, AND IN FACT, THE LOS ANGELES REGION LEADS THE WAY IN MANY OF THESE DIRECTIONS ALREADY, SPURRED ON AS WE ARE BY THE HIGHEST CAR OWNERSHIP PER CAPITA IN THE NATION, THE NATION'S WORST CASE OF AIR POLLUTION, 50% OF WHICH COMES FROM AUTOMOBILES, AND THE WORST CONGESTION IN THE NATION AS MEASURED IN HOURS OF DELAY, MILES OF DELAY OR ANY OTHER INDEX YOU MAY CHOOSE.

WE ARE NOT PROUD OF THESE STATISTICS: BUT THEY ARE A TREMENDOUS SPUR TO INNOVATIVE THINKING AND ACTIONS. WITNESS OUR PROPOSED NEW TOLL ROADS, TO BE BUILT WITH PRIVATE INVESTMENT, OUR AGRESSIVE CAR-POOLING PROGRAMS, AND OUR STRONG ENCOURAGEMENT TO THE PRIVATE SECTOR TO PARTICIPATE IN SHARING THE RESPONSIBILITY THROUGH RETHINKING THE STRUCTURE OF THE WORKPLACE BOTH IN TIME AND IN SPACE: THROUGH ALTERNATIVE WORK TIMES AND TELECOMMUTING. OUR STUDIES UNDERTAKEN IN SUPPORT OF OUR REGIONAL MOBILITY PLAN PROPOSE THAT FULLY THIRTY PERCENT OF ALL JOURNEY TO WORK TRIPS BE AVOIDED ENTIRELY THROUGH FLEXIBLE WORK SCHEDULING AND

TELECOMMUTING, AND THAT ANOTHER 20% OF THE REMAINING TRIPS BE IN SHARED AUTOMOBILES AND VANS, A FIGURE WHICH WE BELIEVE IS AT THE PRACTICABLE LIMIT OF CAR AND VAN POOLING IN A WORKFORCE AS LARGE AND DIVERSE AS OURS.

BUT DESPITE ALL THESE EFFORTS, WHICH WILL INVOLVE A MASSIVE CHANGE OF LIFESTYLE FOR THE SOUTHERN CALIFORNIAN WHO IS REPUTEDLY MORE HOOKED ON THE AUTOMOBILE THAN ANY OTHER IN OUR NATION, WE MUST STILL LOOK TO A SIGNIFICANT INCREASE IN FACILITIES, AND A MASSIVE EFFORT TO MAINTAIN EXISTING FACILITIES IF WE ARE TO REMAIN MOBILE AND PRODUCTIVE. SHEER POPULATION GROWTH DICTATES OUR GOALS. AS A RESULT, WE HAVE THOUGHT LONG AND HARD ON OUR FUTURE, AND ON THE MOST APPROPRIATE ROLES FOR FEDERAL, STATE, LOCAL AND REGIONAL PUBLIC SECTOR PROGRAMS, AS WELL AS THAT OF THE PRIVATE SECTOR IN MEETING THE TREMENDOUS CHALLENGES BEFORE US.

SCAG HAS, FOR INSTANCE, DEVELOPED A SPECIFIC SET OF PRINCIPLES REGARDING THE POST INTERSTATE PROGRAM, ADOPTED FORMALLY BY OUR EXECUTIVE COMMITTEE WHICH REPRESENTS A CONSENSUS OF LOCAL AND COUNTY ELECTED OFFICIALS. THESE ARE:

1. RETAIN A FEDERAL ROLE IN PRESERVING THE INTERSTATE SYSTEM THROUGH A CONTINUED COMMITMENT TO MAINTENANCE AND REHABILITATION.

2. RETURN HIGHWAY TRUST FUNDS TO THE SOURCE PROMPTLY AND EQUITABLY. THE HIGHWAY TRUST FUND SHOULD BE EARMARKED FOR TRANSPORTATION PURPOSES ONLY AND NOT USED FOR DEFICIT REDUCTION.

3. INCREASE FUEL TAXES WITH A PRIORITY FOR A STATE-LEVEL INCREASE. RESERVE ALL FUEL TAXES FOR TRANSPORTATION PURPOSES ONLY.

4. CREATE A MORE EQUITABLE, FLEXIBLE SYSTEM OF ALLOCATING FUNDS TO THE STATES, WITH PROGRAMMING AND FUNDING DECISIONS MADE AT THE STATE, REGIONAL/MPO AND LOCAL LEVELS. PERMIT COST-EFFECTIVE INVESTMENTS ACROSS A RANGE OF IMPROVEMENTS INCLUDING FREEWAYS, EXPRESSWAYS, ARTERIALS AND OPERATIONAL IMPROVEMENTS. PRESERVE THE 85% MINIMUM RETURN-TO-SOURCE POLICY.

5. ENSURE ADEQUATE TRANSIT FUNDING AND AUTHORIZE MORE FLEXIBLE USE OF FUNDING FOR CAPITAL OUTLAY AND OPERATING COSTS. TRANSIT SHOULD RETAIN THE CURRENT ONE CENT OF THE FEDERAL GAS TAX AND RECEIVE A PROPORTIONATE SHARE OF ANY NEW MONEY FROM AN INCREASE IN THE FEDERAL GAS TAX.

6. WORK IN PARTNERSHIP WITH STATE AND LOCAL INTERESTS TO DEFINE A SYSTEM OF REGIONAL SIGNIFICANCE THAT CLEARLY REPRESENTS LOCAL CONCERNS. THE SYSTEM SHOULD INCLUDE

AND RECOGNIZE THE COMPLEMENTARY FUNCTION OF THE INTERSTATE, PRIMARY AND SECONDARY SYSTEMS AND ARTERIALS AS WELL AS RAIL, MAJOR TRANSIT LINES, INTERMODAL FACILITIES, AND LAND-SIDE ACCESS TO PORTS AND AIRPORTS. FEDERAL CATEGORICAL FUNDING SHOULD BE LIMITED TO PLANNING, RESEARCH AND DEVELOPMENT, TRANSIT AND SAFETY, FEDERAL AID URBAN AND SECONDARY. AT A MINIMUM, CURRENT FUNDING LEVELS FOR MAINTENANCE AND OPERATION OF THE HIGHWAY AND TRANSIT SYSTEMS SHOULD BE MAINTAINED.

7. INCREASE THE FEDERAL COMMITMENT TO APPLIED RESEARCH, TECHNOLOGY TRANSFER, AND DEVELOPMENT OF ADVANCED TRANSPORTATION TECHNOLOGIES AND SYSTEMS.

8. DISCONTINUE THE PRACTICE OF CALCULATING HIGHWAY DEMONSTRATION PROGRAMS AGAINST THE STATES' MINIMUM ALLOCATIONS.

9. SUPPORT NEW SOURCES OF FUNDING FOR MEETING TRANSPORTATION-RELATED AIR QUALITY REQUIREMENTS.

AS CURRENTLY STATED, THE PRINCIPLES DO NOT FULLY FUND THE REGIONAL MOBILITY PLAN AND DEPEND UPON SIGNIFICANT STATE AND LOCAL EFFORTS IN CONJUNCTION WITH REVISIONS TO THE FEDERAL PROGRAM. THE REGION WILL CONTINUE TO REFINE ITS POSITION ON THE FEDERAL FUNDING PROGRAM AS ISSUES EVOLVE.

THE NEEDS OF THE REGION DO NOT NICELY MATCH THE CURRENT FEDERAL CATEGORIES AND PROGRAMS. THE REGIONAL MOBILITY PLAN PLACES MAJOR NEW EMPHASIS ON TRANSIT AS CONTRIBUTING TO SOLVING MOBILITY PROBLEMS ARISING FROM CONTINUED STRONG GROWTH IN ONE OF THE LARGEST METROPOLITAN AREAS OF THE COUNTRY.

SOUTHERN CALIFORNIA IS IN THE GRIP OF BOTH MOBILITY AND CLEAN AIR CRISES. THE PRIMARY SOURCE OF BOTH OF THESE CRISES LIES IN OUR NEAR TOTAL RELIANCE ON THE AUTOMOBILE, AND THEREFORE TO THE STATE AND FEDERAL POLICIES WHICH HAVE SUPPORTED AND ENCOURAGED ITS UNIVERSALIZATION TO THE EXCLUSION OF OTHER MODES. THE TIME HAS COME, IN FACT, IT CAME A LONG TIME AGO, TO MAKE A SERIOUS EFFORT TO REVERSE THIS SITUATION AND BRING A BALANCE INTO THE SUPPORT FOR TRANSIT SO THAT WE MAY NOT ONLY ENJOY MOBILITY, BUT CAN SERIOUSLY ATTACK OUR AIR QUALITY PROBLEM AT THE SAME TIME. THE MOST STRIKING CHARACTERISTIC OF THE TRANSPORTATION SYSTEM IN SOUTHERN CALIFORNIA TODAY IS THAT MORE THAN 95% OF ALL TRIPS IN OUR ARE REGION MADE IN AUTOMOBILES, AND LESS THAN 3% BY TRANSIT OF ANY FORM. WHEN WE PREPARED OUR REGIONAL MOBILITY PLAN, OUR STUDIES SHOWED THAT THERE WAS SIMPLY NO WAY TO BUILD OURSELVES OUT OF OUR WOES: THE ANTICIPATED 40% INCREASE IN POPULATION WOULD OVERWHELM ANY PROGRAM OF CONSTRUCTION WE INITIATED. ONLY IF WE

SIMULTANEOUSLY ATTACKED THE PROBLEM ON A WIDE RANGE OF FRONTS INCLUDING DEMAND MANAGEMENT, SYSTEM MANAGEMENT, GROWTH MANAGEMENT AND TRANSIT PROMOTION COULD WE HOPE TO MEET OUR GOALS. SO WHILE WE ARE ASKING FOR ASSISTANCE TO HELP MAINTAIN THE HIGHWAYS WE ALREADY HAVE, WE ARE ALSO ENGAGED IN A MAJOR EFFORT TO PERSUADE OUR POPULATION TO LIVE CLOSER TO WORK, AND TO MAKE BETTER USE OF THEIR PRIVATE TRANSPORTATION THROUGH SHARING.

THE NEED FOR TRANSIT IN SOUTHERN CALIFORNIA

BUT, THIS IS NOT ENOUGH. WE MUST HAVE A VASTLY EXPANDED TRANSIT SYSTEM AS WELL, A SYSTEM WHICH ALTHOUGH EXPENSIVE, WE ARE CONVINCED WILL REPAY ITS INVESTMENT MANY TIMES OVER THROUGH SUPPORTING THE CONTINUED PROSPERITY OF SOUTHERN CALIFORNIA.

OUR TRANSIT OBJECTIVE IS TO TRIPLE THE RUSH HOUR SHARE OF TRIPS FOR TRANSIT OVER THE NEXT TWENTY YEARS. THIS TRANSLATES INTO THE CONSTRUCTION OF NEARLY FOUR HUNDRED MILES OF EXCLUSIVE MASS TRANSIT LINES, BOTH RAIL AND BUS, A DOUBLING OF THE EXISTING BUS FLEET, AND THE CREATION OF A SIGNIFICANT COMMUTER RAIL SYSTEM AS WELL. THIS, WE ANTICIPATE, WILL COST US MORE THAN $30 BILLION OVER THE NEXT 20 YEARS IN CAPITAL COSTS. OF COURSE, WE DO NOT EXPECT THAT ALL OF THIS MONEY WILL ALL COME FROM THE FEDERAL BUDGET.

ALTHOUGH THE SHORTFALL ANTICIPATED IS AROUND $18 BILLION IN CAPITAL AND AS MUCH AS 50% OF THE OPERATING COSTS, WE ARE MAKING A MAJOR EFFORT AT THE STATE AND LOCAL LEVELS TO NARROW THIS GAP. ALREADY, THREE OF OUR FIVE METROPOLITAN COUNTIES HAVE IMPOSED 1/2 CENT SALES TAX SURCHARGES FOR TRANSPORTATION. THE OTHER TWO ARE ATTEMPTING TO DO SO THROUGH THE BALLOT BOX, AND ONE COUNTY IS ALREADY CONSIDERING A SECOND 1/2 CENT MEASURE TO DOUBLE THEIR EFFORT.

FINANCING TRANSIT IMPROVEMENTS

FURTHER, THE STATE OF CALIFORNIA HAS PROPOSED TO DOUBLE THE STATE GAS TAX (TO BE USED FOR BOTH HIGHWAYS AND TRANSIT). BUT PERHAPS EVEN MORE SIGNIFICANTLY, THIS MEASURE IS TIED TO BOTH A LIFTING OF THE STATE CONSTITUTIONAL LIMIT ON EXPENDITURES AS IT CURRENTLY APPLIES TO TRANSPORTATION, AND TO A STATE-WIDE PROGRAM OF CONGESTION MANAGEMENT, LOCALLY ENFORCED, WHICH WOULD BEGIN TO MAKE A SIGNIFICANT IMPACT ON THE PACE AND STYLE OF DEVELOPMENT IN THE REGION BY SPECIFICALLY TYING DEVELOPMENT TO MAINTENANCE AND EVEN IMPROVEMENTS IN TRAFFIC SERVICE.

THE NEED FOR FEDERAL SUPPORT

ALL THIS IS BY WAY OF LEADING UP TO OUR MAJOR POINT, WHICH IS THAT EVEN WITH THIS SIGNIFICANT LOCAL EFFORT, WE LACK THE NEEDED SUPPORT AT THE NATIONAL LEVEL, BOTH FOR EXISTING PROJECTS AND FOR OUR FUTURE WORK. LOS ANGELES TODAY CONSUMES ABOUT 30% OF THE NATIONAL BUDGET FOR MASS TRANSIT GUIDEWAY CONSTRUCTION: YET THIS SUM, VAST THOUGH IT MAY SEEM, WILL ONLY BUILD US ABOUT 30 MILES OF LINE IN 20 YEARS, AND THAT TO SERVE A REGION WITH MORE THAN 18 MILLION PEOPLE COVERING AN URBANIZED AREA OF MORE THAN 8000 SQUARE MILES. I MENTIONED BEFORE THAT WE DO NOT ANTICIPATE THAT FEDERAL FUNDING WILL MEET OUR REQUIREMENTS AND TAKE US OFF THE HOOK: TO THE CONTRARY, OUR PLANS MUST BE BASED ON A MAXIMUM OF LOCAL INITIATIVE. BUT FEDERAL POLICY MUST BE RE-WRITTEN TO FACILITATE OUR MAKING THE BEST USE OF AVAILABLE RESOURCES, AND, PERHAPS MORE IMPORTANTLY, TO STIMULATE LOCAL EFFORTS TO REVERSE THE DEPENDENCE ON THE AUTOMOBILE THOUGH REVISIONS IN TAX CODES, THROUGH ENCOURAGING - EVEN INSISTING - ON ALTERNATIVE ANALYSES WHICH EXAMINE TRANSIT ALTERNATIVES TO HIGHWAY PROJECTS AND THROUGH FUNDING FLEXIBILITY WHICH ASSURES THAT SOLUTIONS WHICH BEST MEET LOCAL NEEDS CAN BE IMPLEMENTED REGARDLESS OF WHICH SPECIFIC MODE IS ADOPTED. FURTHER, FEDERAL ASSISTANCE MUST ENCOURAGE AND PROMOTE REAL INTERMODAL PLANNING, SO THAT ONCE AGAIN THE MOVEMENT OF PERSONS (AND GOODS), RATHER THAN VEHICLES BECOME THE PRIMARY

GOAL OF THE TRANSPORTATION SYSTEM.

THE ROLE OF MARKET INCENTIVES

FURTHER, IT HAS BECOME ABSOLUTELY CLEAR THAT PUBLIC FUNDS ALONE WILL NEVER BE SUFFICIENT TO DO THE JOB. NOR DO WE THINK THAT THEY SHOULD. THE NEARLY TOTAL RELIANCE ON PUBLIC FUNDS IN THE RECENT PAST HAS BEEN FOR SIMPLICITY AND EXPEDIENCE, OR ELSE BECAUSE WE THOUGHT THERE WAS NO OTHER WAY. THE PUBLIC TRANSIT SYSTEMS OF TODAY ARE BUILT ON THE SKELETONS OF THE GREAT PRIVATE SYSTEMS OF THE PAST. THAT TRANSIT WAS ONCE PROFITABLE ENOUGH TO INVITE GREAT CORPORATIONS IN THE PAST TO INVEST HEAVILY IN ITS CONSTRUCTION IS CERTAINLY SUGGESTIVE THAT WE HAVE OVERUSED THE AUTOMOBILE, OR AT LEAST SUBSIDIZED IT SO HEAVILY THAT IT HAS EFFECTIVELY DRIVEN TRANSIT FROM THE MARKET. WE MUST REVERSE THIS SITUATION, SO THAT ONCE AGAIN TRANSPORTATION COSTS ARE FAIRLY BORNE BY USERS IN ALL CASES, AND THE PRIVATE SECTOR CAN AGAIN BE DRAWN INTO INVESTING WITH THE ANTICIPATION OF A FAIR RETURN ON THEIR INVESTMENT.

IN OUR REGION, WE PROPOSE TO DO THIS THROUGH SIGNIFICANT INCREASES IN PARKING CHARGES IN OUR MAJOR ACTIVITY CENTERS AND CONGESTION CHARGES ON THE FREEWAYS, THE FUNDS FROM WHICH WILL BE USED TO ALLEVIATE CONGESTION THROUGH INVESTMENT IN TRANSIT. IT IS HOPED THAT THE COMBINATION OF INCREASED

TRANSIT USAGE, AND THE INCREASED COST OF OPERATING AN AUTOMOBILE (TO MAKE IT MORE NEARLY PAY ITS WAY) WILL OPEN UP THE MARKET TO PRIVATE INVESTMENTS AS WELL, PARTICULARLY THROUGH JOINT DEVELOPMENT OF STATIONS AND STATION AREAS, BUT ALSO IN THE POTENTIAL OF MULTIPLE USE OF THE RIGHTS OF WAY. WE WOULD ENCOURAGE YOU TO INCLUDE CONSIDERATION OF SUCH JOINT PUBLIC/PRIVATE PARTNERSHIPS IN THE DEVELOPMENT OF TRANSIT SYSTEMS THROUGH INCENTIVES FOR IMAGINATIVE MULTIPLE USES OF FACILITIES.

ADDITIONALLY, THE FEDERAL GOVERNMENT HAS A CLEAR RESPONSIBILITY IN FOUR AREAS OF MAJOR IMPORTANCE:

1. RESEARCH AND DEVELOPMENT IN TRANSPORTATION SYSTEMS. THE PRESENT FUNDING ALLOCATIONS FOR RESEARCH AND DEVELOPMENT ARE PITIFULLY INADEQUATE, AND ARE RESULTING IN NOT ONLY A LOSS OF TECHNOLOGICAL LEADERSHIP, BUT EVEN WORSE, A FAILURE TO HAVE SOLUTIONS AVAILABLE FOR OUR PRESSING PROBLEMS. RESEARCH OF THIS TYPE IS BEING UNDERTAKEN IN THE PATH PROGRAM OF CALTRANS AND THE UNIVERSITY OF CALIFORNIA. IT SHOWS DEFINITE PROMISE, BUT IN THE ABSENCE OF FEDERAL SUPPORT IS PROCEEDING FAR TOO SLOWLY TO MEET THE URGENCY OF OUR SITUATION.

38-253 O—91——15

2. SUPPORT AND, WHERE NECESSARY, INCENTIVES TO INCREASE UTILIZATION OF TRANSIT AND CLEAN AIR TECHNOLOGIES.

3. A RECOGNITION OF THE FEDERAL RESPONSIBILITY FOR RESPONDING TO THE GLOBALIZATION OF THE ECONOMY, AND ITS DISPROPORTIONATE IMPACT ON PORT (AIR AND SEA) CITIES. IN PARTICULAR, THIS MEANS THAT THERE IS A CLEAR FEDERAL ROLE FOR ASSISTING PORT CITIES TO DEAL WITH THE FLOWS OF GOODS AND PEOPLE INVOLVED IN INTERNATIONAL MOVEMENTS ON THE LAND SIDE WHERE THE IMPACTS PLACE MAJOR BURDENS ON LOCAL TRANSPORTATION ARTERIES.

4. FEDERAL AGENCIES MUST BETTER COORDINATE THEIR PROGRAMS TO ASSURE THAT ACTIONS TAKEN IN SUPPORT OF ONE SET OF OBJECTIVES DO NOT CONFLICT WITH OTHERS. A CLEAR EXAMPLE OF THIS IS THE OFTEN CONFLICTING RELATIONSHIP BETWEEN EPA AND DOT, WHERE EPA MANDATES CERTAIN ACTIVITIES WHICH CANNOT BE ACCOMPLISHED WITHIN THE RESTRICTIVE PROGRAM CATEGORIES OF DOT. IN OUR REGION, THE SWITCH TO TRANSIT, MANDATED BY THE CLEAN AIR ACT, IS BEING HELD UP BY THE LACK OF SUPPORT FOR CAPITAL AND OPERATING EXPENSES. EVEN SUCH A SIMPLE ITEM AS SWITCHING TO CLEAN FUELS REQUIRES

CHANGES IN DOT POLICY TO ASSURE THAT REVENUES PREVIOUSLY DERIVED FROM GASOLINE SALES ARE REPLACED BY EQUIVALENT TAXES ON ALTERNATIVE FUELS.

FINALLY, THE FEDERAL ROLE MUST BECOME PROACTIVE RATHER THAN REACTIVE AS IT HAS BEEN FOR FAR TOO LONG. ECONOMIC VIABILITY, SOCIAL CONDITIONS, AND GLOBAL ENVIRONMENTAL CONSIDERATIONS ALL DICTATE THAT THE UNITED STATES ONCE AGAIN BECOME A LEADER IN THE DEVELOPMENT OF NEW TECHNOLOGIES, ATTITUDES AND APPROACHES.

IN SUM, WE SUPPORT BROADENING THE PARTNERSHIP RESPONSIBLE FOR OUR NATION'S SURFACE TRANSPORTATION AND TRANSIT PROGRAMS TO INCLUDE THE FEDERAL GOVERNMENT, STATE, AND LOCAL GOVERNMENTS ALONG WITH THE PRIVATE SECTOR AS FULL PARTNERS, EACH SHOULDERING A MAJOR SHARE OF THE RESPONSIBILITY FOR PLANNING AND FUNDING THE SYSTEMS WHICH ARE REQUIRED TO ASSURE OUR CONTINUED PROSPERITY AS A NATION. WE URGE THE FEDERAL GOVERNMENT TO CONTINUE ITS ROLE AS A MAJOR LACTOR, WHILE AT THE SAME TIME, WE PLEDGE, AS LOCAL GOVERNMENTS TO MEET OUR END OF THE BARGAIN. BUT WE CANNOT GO IT ALONE, AND TO DEVOLVE ALL RESPONSIBILITY TO STATE AND LOCAL GOVERNMENT, WOULD, IN OUR OPINION, LEAVE US VULNERABLE

NOT ONLY AS A REGION BUT ALSO AS A NATION.

WE THANK YOU FOR THIS OPPORTUNITY TO APPEAR BEFORE YOU AND TO HAVE OUR TESTIMONY INCLUDED IN YOUR DELIBERATIONS.

ADDITION TO THE RECORD

Statement of the U.S. Chamber of Commerce

ON: FEDERAL AID HIGHWAY REAUTHORIZATION

TO: SUBCOMMITTEE ON SURFACE TRANSPORTATION OF THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

BY: WILLIAM D. KELLEHER

DATE: MARCH 13, 1990

The Chamber's mission is to advance human progress through an economic, political and social system based on individual freedom, incentive, initiative, opportunity and responsibility.

The U.S. Chamber of Commerce is the world's largest federation of business companies and associations and is the principal spokesman for the American business community. It represents nearly 180,000 businesses and organizations, such as local/state chambers of commerce and trade/professional associations.

More than 93 percent of the Chamber's members are small business firms with fewer than 100 employees, 45 percent with fewer than 10 employees. Yet, virtually all of the nation's largest companies are also active members. We are particularly cognizant of the problems of smaller businesses, as well as issues facing the business community at large.

Besides representing a cross section of the American business community in terms of number of employees, the Chamber represents a wide management spectrum by type of business and location. Each major classification of American business--manufacturing, retailing, services, construction, wholesaling, and finance--numbers more than 10,000 members. Yet no one group constitutes as much as 32 percent of the total membership. Further, the Chamber has substantial membership in all 50 states.

The Chamber's international reach is substantial as well. It believes that global interdependence provides an opportunity, not a threat. In addition to the 59 American Chambers of Commerce Abroad, an increasing number of members are engaged in the export and import of both goods and services and have ongoing investment activities. The Chamber favors strengthened international competitiveness and opposes artificial U.S. and foreign barriers to international business.

Positions on national issues are developed by a cross section of its members serving on committees, subcommittees and task forces. Currently, some 1,800 business people participate in this process.

STATEMENT
on
FEDERAL AID HIGHWAY REAUTHORIZATION
for submission to the
SUBCOMMITTEE ON SURFACE TRANSPORTATION
of the
HOUSE COMMITTEE ON PUBLIC WORKS AND
TRANSPORTATION
for the
U.S. CHAMBER OF COMMERCE
by
William D. Kelleher*
March 13, 1990

The U.S. Chamber of Commerce appreciates this opportunity to express its views on surface transportation infrastructure crisis and the reauthorization of federal highway programs.

America's transportation infrastructure is crumbling. Decaying and overburdened roads, bridges, highways, airports, waterways and railroads are robbing the nation of economic vitality. Mobility, the ability to move people and goods, has always been important to the U.S. because of its size and dispersion of economic activity. In a global economy, an efficient and cost-effective transportation network is a key to international competitiveness.

As economic boundaries disappear and economic opportunities develop overnight, the U.S.'s ability to move people and goods quickly will play a major role in shaping its economic future.

---

* Manager, Community Resources Section

In the 1950s and 1960s, America had a transportation network that was the envy of the rest of the world. This network played an important role in enhancing productivity and keeping costs low. Today, the U.S. faces a gridlock crisis in its transportation network.

Three important trends have come together to create this situation.

- The U.S. has not maintained its existing infrastructure; it has delayed and postponed repair and rehabilitation work.

- The country's demographic and economic patterns have shifted dramatically. The U.S. has not built the new facilities necessary to accommodate new growth or changes in lifestyles and locational patterns.

- The public sector decision making process has malfunctioned continuously. Congress and the Administration have eroded the user fee concept for transportation trust funds by shifting dollars to other areas and allowing large paper surpluses to develop. State and local governments, along with federal officials, have lacked the political will to undertake long-term projects that impose immediate costs but provide major long-term benefits.

Solving all of the U.S.'s infrastructure problems will require an approximately $3 trillion investment by 2020. A combination of federal user fees, state and local revenues, and privatization can help to meet the financial needs of the system. It will take major coalition-building efforts to forge the public-private partnerships necessary to exercise the political will to accomplish the job.

Over the past year, the Chamber has worked to promote grass-

roots business involvement in this issue. The August 1989 edition of Nation's Business, the Chamber's monthly magazine had a cover story on this issue (see attachment A) and Services Watch, the Chamber's newsletter on service sector issues, had a special report (see attachment B) and a series of articles on the subject. In addition, the Chamber produced an eight-minute video outlining the nation's infrastructure crisis that has been distributed to over 350 business organizations. The National Chamber Foundation in collaboration with Eno Foundation for Transportation, Inc., a nonpartisan foundation dedicated to improving the nation's transportation system, produced Keep America Moving, a one-hour television special that discusses the role of transportation in community economic development. It has been distributed to public television stations covering approximately 70 percent of the nation's households.

Infrastructure Investments

By almost every measure, the U.S. has been reducing its investment in infrastructure. As a share of gross national product (GNP), spending on public capital has dropped from 2.3 percent of GNP in 1960 to less than 1.1 percent in 1985. The U.S. ranks 55th in the world in capital investment in infrastructure. It spends a smaller share of its resources on highway investments than Japan spends, which relies more heavily on rail transportation than the U.S. does.

As noted by David A. Aschauer, senior economist at the Federal Reserve Bank, the net result is a decline in U.S. competitiveness. "A root cause of the decline in the competitive position of the United States in the international economy may be found in the low rate at which our country has chosen to add to its stock of highways, port facilities, airports and other facilities which aid in the production and distribution of goods and services."

As shown in chart 1, as the U.S. investment in infrastructure has fallen, so has its productivity.

Other measures show a decline in infrastructure investment as well. Absolute dollar amounts invested in infrastructure when measured in 1972 constant dollars fell by 17 percent between 1964 and 1985. When measured on a per capita basis, spending has dropped by 40 percent since 1964. Perhaps the clearest way to demonstrate the decline in surface transportation infrastructure investment is to compare some numbers from the 1960s and 1980s. In the 1960s, 12 cents of every dollar spent on automotive transportation went toward roads. In the 1980s, only six cents of every dollar has gone toward the U.S.'s road network - a 50 percent reduction at a time of escalating road use.

Between 1968 and 1988, the private sector invested in new plants and equipment at a much higher rate than the public sector invested in infrastructure. Private-sector spending on capital rose from just over $4 trillion dollars in 1982 to $7.3 trillion in 1988 while non-military public capital stock increased from $1.2 trillion to $1.7 trillion. The ratio of public to private fixed capital stocks sunk from over 30 percent in 1968 to

approximately 23 percent by the end of 1988.

As Mr. Aschauer noted in a March 14, 1990, Wall Street Journal editorial, "Public Spending and Private Profit":

> Countries that sustain a high level of public investment relative to output experience higher productivity growth than other countries. For example, during the past two decades Japan has invested about 5.1% of output in public works and achieved productivity growth of 3.1% per annum while the U.S. has maintained a low public investment ratio of 0.3% and seen inferior productivity growth of 0.6% per year. A part of the explanation of the decline in the competitive position of the U.S. may be found in the low rate at which it has added to its stock of ports, highways, airports and other facilities that aid in the production and distribution of goods and services.
>
> Yet physical capital investment slid from 24.3% of total federal outlays in 1960 to 11% in 1990 and is scheduled to fall to 10.7% in 1991. Similarly, total federal investment has slumped from 34.1% of outlays in 1960 to 19.4% in 1990 and, if the president's proposed budget were adopted, would decrease to 19.2% in 1991.

Twenty years of underinvestment has led to the wearing out of the basic systems necessary to support economic growth.

America's Changing Transportation Needs

The 1980s was been the decade of the suburbs in terms of economic growth. Since 1950, 86 percent of the U.S.'s population growth has taken place in the suburban areas surrounding its central cities. While Americans were deciding that they liked

the lower density of suburban living, they were also choosing to live in larger metropolitan areas. By the mid-1980s, approximately half of the U.S. population lived in 35 areas with 1 million or more people and one of three Americans lived in areas with 2.5 million or more people. (Seventy-five percent of all Americans live in metropolitan areas.)

In 1950, only 14 American metropolitan areas had populations of one million or more. These areas contained less than 30 percent of the nation's population. Jobs moved with population. Between 1960 and 1980, over 60 percent of all job growth took place in suburban areas. In 1960, American suburbs had about 14 million jobs or 35 percent of the U.S.'s employment base. By 1980, the number of jobs had more than doubled to 33 million. Today, as we enter the 1990s, businesses in the suburbs employ 60 percent of all workers and are responsible for 67 percent of all job growth.

The impact of these trends can be seen in communities around the country.

- In Gwinnett County, 18 miles outside of Atlanta, the population has grown from 72,000 in 1970 to 250,000 in 1987.

- Oakland County, near Detroit, has been responsible for 40 percent of all job growth in Michigan since 1982.

- Tysons Corner, a sprawling Washington, D.C. suburb in Fairfax County, Virginia, has more office space than either Baltimore or downtown Miami.

- This growth in the number of people and jobs in new suburban locations has doubled commuting time and has led to rush hours in the New York metropolitan area that will last for 15 hours a day by 2000.

In addition to shifts in population and job locations, there continues to be a major social change in the composition of the work force, as the Eno Transportation Foundation Report Commuting in America points out.

- Between 1960 and 1980, the working-age population increased by 40 million, an increase of 38 percent, compared to an overall population growth of 26 percent.

- More than twice as many people entered the working-age group between 1970 and 1980 as did in the 1950 to 1960 period. Total population is projected to grow by another 40 million by 2010.

- In 1950, about one-third of working age women were in the labor force. By 1985, that figure had jumped to almost two-thirds. Of the 50 million new entries into the labor force since 1950, 30 million were women. Women represented only 28 percent of the labor force in 1950; today they exceed 44 percent.

- In those metropolitan areas experiencing high rates of population growth in the 1970s, the growth in the number of workers was far in excess of population growth.

- Phoenix, the fastest-growing large metropolitan area in the nation, increased in population by 55 percent between 1970 and 1980. The worker increase was 80 percent, 25 percentage points higher.

This explosion of workers has led to an explosion in commuters, and the U.S. is more dependent than ever on the automobile. We are faced with a national gridlock problem that is threatening our quality of life and economic vitality.

Public Sector Problems

What happened to the coalitions and programs that built the interstate highway network? At the federal level, efforts to reduce the deficit have led Congress and the Administration to use revenues from transportation user fees for other purposes. Because these user fees count as revenues to the government, they can be used to make the deficit look smaller. The government has placed IOUs in the transportation trust funds that finance federal highway, airport and waterway programs.

The result of this policy has been the accumulation of a $29 billion surplus in trust funds at a time when bridges and roads are collapsing.

At the state and local levels, the shortage of funds has been matched by the expansion of forces that oppose change and development. Groups, popularly known as NIMBY, "Not In My Back Yard," seem to oppose any major public capital investment project. They have halted or delayed major road and transportation projects in all parts of the country and have made orderly planning and implementation extremely difficult. State and local elected officials under pressure from these groups often ignore transportation needs and realities. Business needs to help to build the public-private partnerships that can respond to anti-growth forces and support public efforts to meet the nation's infrastructure needs.

Consequences

Can the U.S. afford to ignore these problems? If it wants to remain competitive in a global economy and enjoy safe and timely travel, the answer is no. The infrastructure problem is at a crisis level now.

- More than 60 percent of the miles of paved highways in the U.S. need some form of surface rehabilitation.

- More than 40 percent of bridges over 20 feet long are structurally deficient or functionally obsolete.

- Highway congestion already is serious in many areas, and the total number of miles travelled annually by vehicles will increase by one-third over the next decade, to 3 trillion.

- By 2005, traffic delays caused by inadequate roads will cost the U.S. $50 billion a year in lost wages and wasted gas. Continued neglect of infrastructure is also costing jobs and increasing costs. The Port Authority of New York and New Jersey estimated that the region has lost 600,000 jobs as a result of infrastructure deterioration. In Pittsburgh, U.S. Steel estimated that it pays at least $1 million a year in additional costs to detour its trucks 18 miles around a major bridge closed by the state for lack of repair.

The American Society of State Highway and Transportation Officials has estimated that surface transportation demand will at least double by 2020. If the U.S. wants to continue to maintain at least the current level of service, it must increase its spending to $95 billion a year, up from the current $81 billion being spent by federal, state and local governments (see chart 2).

CHART 2: Surface Transportation Annual Expenditure Requirements, 1988-2020

Transportation Area	Investment Range (billions)		
	Current	Low	High
Highways, Roads & Bridges	$66.0	$80.0	$100.5
Transit	14.5	15.1	15.8
Linkage to Other Modes	N.A.	1.0	1.0
Total	80.5	96.1	117.3

In order to maintain its economic leadership in the world economy and avoid the negative and costly effects of inaction, the U.S. must commit the required funds to improve its transportation system.

Key Considerations

National transportation gridlock and decay are threatening the livability of communities and the economic vitality of the nation. Urban and suburban areas are being choked by traffic congestion, and rural communities are being isolated by collapsing bridges and inadequate roads. For over 30 years, the focal point of transportation policy has been the building of the National System of Interstate and Defense Highways. With the completion of the Interstate System in expected in 1991, it is time for the U.S. to redirect its transportation policy. The process will require concerted efforts by all levels of government and the private sector. In formulating a new national transportation strategy, the Chamber urges Congress to consider these key points:

- Preservation of the existing road network is vital to improving mobility and is key to investing in a cost-effective transportation strategy.

- Congestion relief is vital to both improving the quality of community life and moving goods efficiently in commerce. Moving goods both through and in metropolitan areas has become extremely time-consuming and costly. The nation's surface transportation system should use a mix of highway construction, transit improvements and the application of emerging systems management technologies. States and localities should be given the flexibility to develop programs that meet local needs and conform with national goals to improve mobility.

- User and beneficiary fees should be instituted to cover the economic costs of surface transportation facilities. Local general fund commitments to public transportation should be considered.

- The multi modal nature of transportation services must be recognized in surface transportation policy. Links to airports, railways and ports must be included in developing specific transportation programs and projects.

- Safety, planning, research and development are as vital a part of the U.S. transportation needs as building roads and transit facilities. The Chamber recommends that specific funds be set aside to deal with these issues.

- Economic development-- providing employment, reducing transportation costs, improving freight movement, increasing productivity, revitalizing rural America, rejuvenating blighted urban areas, supporting existing facilities, attracting new economic growth, providing for rapidly expanding regions and improving international competitiveness--needs to be a key concern in developing transportation policy.

- Reasonable and responsible concern for the environment and energy conservation are vital parts of any realistic transportation strategy.

- Partnerships between different levels of government and the public and private sectors will be necessary in order to achieve the maximum utilization of limited transportation resources. Because of the fragmented nature of transportation, federal policy should encourage cooperation and coordination. Improving the nation's mobility will be a

shared responsibility of all the participants in this enterprise. Currently, state and local governments and the private sector are increasing their efforts in this field. The federal government should not attempt to ignore its part of this effort. Federal policy should also support and encourage entrepreneurial actions in the area of transit. Attachment C lists specific steps that the Urban Mass Transit Administration can take to encourage grass roots solutions to meeting transit needs.

The Transportation 2020 Project, a coalition of more than 100 national associations representing public and private transportation interests, issued a final report entitled Is Consensus Possible? As part of that coalition, the Chamber supports the work of the group. It believes that there is a consensus in the business community for a strong and vigorous federal role in the transportation field consistent with the above outlined principles.

The Chamber is committed to the concept of a national transportation network that can move people and goods to all parts of this nation in an efficient and effective manner. Proposals such as that of the American Association of State Highway and Transportation Officials (AASHTO) for establishing a Highway System of National Significance matched with a flexible Highway Program to assist in more specific state, local and regional needs represent a sound application of the concepts supported by the Chamber.

The Bush National Transportation Strategy

Ten months ago, U.S. Department of Transportation Secretary Samuel K. Skinner set out to develop a strategic plan for meeting the nation's transportation needs. Secretary Skinner undertook the effort with great energy, and he is to be commended for

focusing the nation's attention on this vital issue. He organized a massive effort and coordinated a study that tapped some of the best thinking in both the public and private sectors.

However, although the Administration's national transportation plan lists many of the hard questions facing the transportation community, it fails to provide the tough answers that we need.

A strategic plan is judged by how it is implemented and by the level of commitment given to it by a firm's Chief Executive Officer. To date, the Administration has shown that it is failing in both these areas. It has not developed a reasonable approach to dealing with transportation trust funds and continues to sacrifice transportation priorities by abusing transportation user fees to cover up the budget deficit.

For the plan to succeed, it has to gain the support and cooperation of the private sector and state and local governments. These are the groups being asked to take much of the responsibility for implementing the plan and providing the resources to fund it. All these groups are disappointed with the plan's lack of vision and abdication of leadership. Regrettably, the plan does not encourage any of these groups in their hope for a new and effective partnership with the federal government in the transportation area.

Chamber Position

The Chamber supports continued federal action to provide a transportation system that meets the nation's mobility needs. In shaping actions in this area, it supports the following principles:

o There is an immediate need to begin to restore those

portions of the basic infrastructure that have fallen into dangerous disrepair. In addition, every effort must be made to begin constructing those projects needed to provide the services required to accommodate growth. Programs to better use the existing infrastructure network should be encouraged.

- Infrastructure plans must include adequate methods to finance not only initial construction but also ongoing maintenance. Much of the current infrastructure problem is the result of neglected maintenance.

- User fees should play a central role in financing infrastructure construction, rehabilitation and maintenance.

- Within the context of a national transportation program, the design and construction of infrastructure are primarily the responsibility of state and local governments.

- The federal role in infrastructure rehabilitation and development should be focused on capital financing.

- The massive infrastructure needs of the nation will require the establishment and enforcement of priorities for repairing, rebuilding and developing the public works needed to support commerce and protect the public health and safety.

- Where appropriate, provision of public infrastructure services through private means or local authorities should be considered on a cost-effective basis. Privatization can and should play a key role in meeting public capital needs.

- Establishment of a federal infrastructure bank should be considered by Congress as a method for improving the

management of federal contributions to state and local efforts. Federal user fee-financed trust funds for infrastructure, such as those earmarked for highways and aviation facilities, should be taken off budget to ensure that the moneys raised through this method are spent efficiently and effectively and with a minimum of political interference. Capital budgeting should also be considered in managing federal infrastructure investments.

Next year, Congress faces one of its most important challenges in 25 years. The basic legislation covering highway and transit programs will expire. The interstate highway system, which has provided a focal point for this legislation, will be declared complete. This will provide Congress, the Administration and the business community with an opportunity to establish new directions and develop new priorities.

The key question underlying all debate in this field is whether Congress has the will to find ways to improve the nation's transportation infrastructure to meet the needs of the 21st century. Without a sound infrastructure network, the U.S. cannot have a strong economy or a high level of productivity.

COVER STORY

ATTACHMENT A

Our Crumbling Infrastructure

The crumbling of America's overburdened infrastructure looms as one of the nation's costliest and most serious problems.

By Joan C. Szabo

A bolt in the substructure of the bridge carrying Interstate Highway 95 over the Mianus River in southwestern Connecticut sheared off early in the morning of June 28, 1983.

Weakened by the loss of support from a steel rod that the bolt had anchored, a 100-foot section of the span collapsed. Two tractor-trailer trucks and two cars went over the edge, dropping 75 feet to the muddy river banks. Three people were killed, and three were critically injured.

It was six months before the 31-year-old bridge was fully reopened to its normal daily traffic of 100,000 vehicles. Repairs cost $20.6 million.

There was also a substantial economic loss to businesses in the area. They were hit hard by massive traffic jams that resulted when cars and trucks were rerouted from I-95, the principal highway between Maine and Florida and one of the most heavily traveled segments of the interstate system.

Griffin Harris, owner of a travel agency in Greenwich, Conn., said his business fell 40 percent because clients were unable to get to his office through the congestion. "It was just a nightmare," he recalls.

Other spectacular bridge collapses in this decade have included the 50-year-old Hatachie River Bridge about 45 miles north of Memphis, Tenn., and a Great Miami River bridge in Ohio, both this year, and a New York State Thruway bridge west of Albany in 1987. A total of 20 people were killed in the three incidents.

These bridge collapses were among the developments that have spotlighted in recent years one of the most serious problems facing the nation today—the crumbling of the American infrastructure and the cost of neglect of the nation's highways, bridges, airports, water systems, sewage-treatment facilities, and other vital public works.

Economic health is directly dependent upon the condition of this infrastructure. Just how much so was described in these terms by the National Council on Public Works Improvement, which Congress created to appraise the condition of America's public-works structure:

"The quality of a nation's infrastructure is a critical index of its economic vitality. Reliable transportation, clean water, and safe disposal of wastes are basic elements of a civilized society and a productive economy.

"Their absence or failure introduces an intolerable dimension of risk and hardship to everyday life and a major obstacle to growth and competitiveness."

And how does this nation's infrastructure measure up to that standard at a time when demands on it are greater than ever? The council's basic finding was not encouraging: "The quality of America's infrastructure is barely adequate to fulfill current requirements and is insufficient to meet the demands of future economic development."

The council, established under the Public Works Improvement Act of 1984, reached that conclusion after two years of extensive research to develop a base for priority recommendations on bringing public works into line with current and future needs.

In addition to that government panel, private-sector voices have joined in the growing effort to alert the nation to its infrastructure problems. Says the U.S. Chamber of Commerce: "There is an immediate need to begin to restore those portions of basic infrastructure that have fallen into dangerous disrepair. ... Investment in public works is as vital for national economic revitalization as investment in our industrial plants. In a modern society, private economic growth is based on sound public works."

A wide range of other organizations share that view. Some snapshots:

- More than 60 percent of the miles of paved highways in the U.S. need some form of surface rehabilitation.
- More than 40 percent of U.S. bridges over 20 feet long are either structurally deficient or functionally obsolete.
- Highway congestion already is serious in many areas, and the total number of miles traveled annually by vehicles using U.S. roads will increase by one-third over the next decade, to 3 trillion miles.
- By the year 2000, traffic delays caused by inadequate roads will cost the U.S. $50 billion a year in lost wages and wasted gasoline.
- The Associated General Contractors of America, the largest organization of construction firms, puts the cost of infrastructure needs at $3.3 trillion, which includes $1.6 trillion for highways, $52 billion for bridges, and $142 billion for water supplies.
- Airports are crowded, airways are congested, and the air-traffic-control system needs substantial upgrading to maintain safety. The Federal Aviation Administration estimates that the number of "seriously congested" airports will soar to 58 by the year 2000, up from 16 in 1986, and the congestion by the turn of the century will affect 74 percent of passengers, compared with 39 percent in 1986.
- Water storage and distribution systems are deteriorating in some older cities, such as New York, Newark, N.J., Cleveland, and Boston. In a certain two-

Our Crumbling Infrastructure

year period, 34 cities suffered an average of 229 water-main breaks per 1,000 miles of main. In addition, leaky pipes cause some major cities to lose as much as 30 percent of their daily water supply.

● Despite a $44-billion federal investment in sewage treatment since 1972, it will take $82.5 billion to meet wastetreatment requirements of the Clean Water Act by 2005, the Environmental Protection Agency estimates.

The massive problem that has developed in these and other areas of the national infrastructure raises the same two questions that are raised by any problem of any magnitude: How did it occur? What must be done to correct it?

A principal reason for neglect of the infrastructure, many experts suggest, is that it is relatively easy to ignore. The Associated General Contractors says: "The nation assumes that drinking water is safe, bridges are structurally sound, the transportation network will be efficient, and rivers, bays, and streams will be clean and suitable for both fishing and recreation.

"Unfortunately, it is only when an infrastructure failure occurs, when we see this quality of life threatened, that most Americans become aware of the necessity of adequate public works."

The National Council on Public Works Improvement puts it this way:

"Of all public services, infrastructure may be the easiest to take for granted. When it functions best, it is noticed least." The infrastructure thus becomes a prime target for economy. The annual increase in total government spending on the infrastructure dropped from 4.5 percent per year during 1961 to 1970 to an average of 0.8 percent per year from 1981 to 1987.

The key factor in this decline has been competition among various public sectors in an era of fiscal retrenchment.

Ironically, the restraint has been extended to various transportation trust funds established to guarantee financing for construction and repair of highways, air-travel facilities and other parts of the infrastructure. Those funds contain earmarked revenues from users of the facilities to be financed. But succeeding Congresses and presidents have employed a fiscal strategy of reducing the federal deficit by retaining substantial surpluses in the transportation accounts, rather than committing money to the designated purposes.

Currently, the Treasury Department estimates, nearly $29 billion in user-paid revenues to the federal transportation trust funds have not been put to work.

The "squeaky-wheel" factor also has come into play as governments have shifted priorities, notably toward social programs. Sally Brain, an economist for the Associated General Contractors, says that many government entities see maintenance as an expense that can be put off until another year.

At the same time, conditions continue to worsen in many areas of the infrastructure because of either neglect or increasing demands.

Airline-passenger traffic has climbed 68 percent since deregulation in 1978, but the number of major airports has not increased. Although several airports have been expanded, no commercial airports have been built at new sites since 1974, and air traffic continues to climb.

Many U.S. bridges designed and built 50 years ago are now reaching the end of their useful lives. Under the Highway Bridge Replacement Program, about 2,871 bridges are repaired or replaced each year. But at that rate, it will take an estimated 80 years to clear the current backlog of bridge-repair needs, according to The Road Information Program. TRIP is a Washington, D.C., nonprofit organization that researches, evaluates, and distributes economic and technical data on highway transportation issues.

The Federal Highway Administration (FHWA) projects that by the year 2000,

Continued on Page 21

Congested highways such as Interstate 95 near Springfield, Va., mean higher costs for businesses that depend on roads for transporting raw materials and finished goods.

Nation's Business August 1989

The Private Path To New Highways

To pay for restoring roads, bridges, and other parts of the nation's crumbling infrastructure at a time of budget constraints, several states are considering various types of arrangements with private entities that would build and run public-works facilities.

These private parties would assume varying degrees of responsibility for highway construction, for example. As in the case of privatization generally, advocates of that course in infrastructure development say that the private sector can complete projects more efficiently and economically than government agencies.

The privatization of public works is not new, by any means. Privately built and operated roads were common in colonial days. Most bridges were in private hands until the early 1930s, and some remain so today. They include the Ambassador Bridge connecting Detroit and Windsor in Canada's province of Ontario and the recently opened toll bridge linking Fargo, N.D., and Moorhead, Minn.

There are scattered instances of private ownership of roads, many of them providing access to and within tourist attractions and real-estate developments.

The possibility of broader use of privatization in public works is receiving increased attention as governments try to cope with infrastructure demands against growing resistance to higher taxes.

In Virginia, for example, the Virginia Highway Corporation Act of 1988 opened the way for private companies to seek authority to construct and operate roads in the state. Soon after the law was enacted, a newly created private firm, the Toll Road Corporation of Virginia (TRCV), submitted a proposal to the Virginia Commonwealth Transportation Board to build and maintain an extension of the publicly run Dulles Toll Road.

TRCV's founder and president is Ralph Stanley, who left the position of head of the Urban Mass Transportation Administration in the U.S. Department of Transportation to enter into private road-building ventures.

The existing Dulles Toll Road is used primarily by commuters living between the Capital Beltway and Dulles International Airport, near Washington. The proposed, privately funded 14-mile road would extend the toll road to serve a fast-growing suburban population.

TRCV developed its proposal with the help of Goldman, Sachs & Co. of New York, an investment banking firm, which produced a plan for financing construction and maintenance costs until toll revenues can pay for upkeep of the road.

Travelers pay as they go on the moneymaking Dulles Toll Road, which serves suburban communities near Washington, D.C.

In reviewing the toll-road proposal, the Commonwealth Transportation Board asked Virginia's Department of Transportation to develop an alternative plan as a way to determine the relative value of the private proposal.

Under the VDOT proposal, $188.4 million in capital funds generated through publicly issued general-obligation bonds would be required for initial development, and a $51.6-million subsidy from the existing toll road would be used to cover a portion of the debt service for the first seven years. The goal for completion of the highway would be June 1993.

The TRCV proposal, however, estimates total costs for construction and initial maintenance would not exceed $145.6 million—financed through a Goldman, Sachs series of bonds issued on behalf of TRCV—and the road would be open by December 1991.

Approval depends on two rulings expected imminently—one from the Commonwealth Transportation Board, the other from the State Corporation Commission.

In Colorado, an unusual mixture of public funding and private development is being used in a project to construct and operate the E-470 Beltway, a section of a business tollway that eventually will encircle Denver.

The E-470 Public Highway Authority (PHA), representing a broad range of regional interests, was formed in 1986 to succeed a coalition of four local governments.

The PHA is to supervise construction and maintenance, and it will serve as liaison between the public and the private sectors.

The project's engineering, construction, financial matters, legal details, environmental requirements, and public-relations efforts are being handled by private firms under contract.

The initial financing will come from a $10-a-vehicle increase in automobile registration fees. Those revenues and the projected income from tolls enabled the E-470 Authority to draw $63 million from an escrow account established by Arapahoe County.

These funds will finance construction of the first section of the beltway, a 5.5-mile stretch to be completed by late 1991.

The $63 million then will be paid back to the county, with interest, and toll revenues will be used to pay for construction of the final three sections of the beltway.

"Over the long term, we estimate that 92 percent of the total funding will come from toll revenue," says Robin McHenry, a spokeswoman for the E-470 Public Highway Authority.

"Only about 5 percent of the total cost will be financed by the vehicle-registration-fee increase, which we secured through a public election," continues McHenry. "The remaining costs will be absorbed by developer impact fees, donations, and designations of the right of way."

The state with more people (25 million) and more cars (22.4 million) than any other is also considering a role for the private sector in meeting its massive transportation needs. The California legislature has approved a plan to "utilize the expertise and financial resources of the private sector to design, build and pay for new transportation projects." The law authorizes four demonstration projects in which private entities will be permitted to lease state-highway rights of way to build toll routes.

—*David J. Ward*

SINCE PASSAGE OF THE 1985 FARM BILL, THE COTTON TARGET PRICE HAS DECLINED FROM 81 CENTS PER LB. TO 72.385 CENTS PER LB., OR 10.8%, AND THE LOAN PRICE HAS DECLINED FROM 57.3 CENTS PER LB. TO 50.27 CENTS PER LB., OR 12.3% IN FIVE YEARS (SEE ATTACHMENT #2).

AT THIS POINT IN THE HISTORY OF AGRICULTURE, AND ESPECIALLY COTTON, PRODUCERS ARE FACING AN INSIDIOUS ILLNESS---THE SO-CALLED "COMPETITIVE" OR "FREE MARKET" PRICE USED AS THE BASIS TO DETERMINE THE TARGET AND LOAN RATES WHICH, IN TURN, DICTATES THE CASH MARKET PRICE.

THE FORMULA USED TO COMPUTE TARGET AND LOAN RATES WERE INTENDED TO PROVIDE ORDERLY MARKETING AND TO KEEP COTTON COMPETITIVE, REFLECTING THE AVERAGE ADJUSTED COST OF PRODUCTION.

HOWEVER, THE LOAN PRICE FORMULA USED IN THE 1979 FARM BILL WAS 48 CENTS PER LB., MUCH LOWER THAN ANTICIPATED. THE CONTINUED USE OF THESE PRICE QUOTATIONS TO ESTABLISH COTTON TARGET AND LOAN PRICES KEEPS LOAN RATES CHEAP, RESULTING IN CHEAP SPOT MARKET PRICES.

USING THESE ARBITRARY, RIGID AND INFLEXIBLE LOAN PRICE COMPUTATIONS, THE LOAN PRICE REMAINS LOW - TOO LOW FOR PRODUCERS TO SURVIVE. THE RESULTING NET INCOME GENERATED IS TOTALLY INADEQUATE TO KEEP UP WITH INFLATION AND PROVIDE ENOUGH EQUITABLE RETURN TO STAY IN BUSINESS.

gestion is adding to the cost of doing business in the U.S." In Los Angeles alone, Lamm says, the out-of-pocket cost of traffic congestion for both business and commuter travelers was more than $500 million in 1988.

Another stake for business is that of the small firms—particularly construction-related companies—that build public-works facilities, from designing them to landscaping them. "Many small businesses will benefit from infrastructure rebuilding," says Peter T. Ruane, president and chief executive officer of the American Road and Transportation Builders Association.

Robert L. Turner, president of the Associated Builders and Contractors, says, "Some of the businesses directly affected include road contractors, pipe manufacturers, cement producers, structural-steel and guardrail firms, painting contractors, and landscapers." ABC represents more than 18,000 merit-shop contractors, subcontractors, materials suppliers, and associated firms.

The Associated General Contractors says that the industry "is typified by family-owned businesses that work in an extremely competitive and open environment."

One of business's most extensive involvements in the nation's infrastructure relates to the second question—how infrastructure problems are to be solved. The answer involves money, lots of it.

The business role will include projects financed directly by companies, and it also will involve payment of the tolls and user fees expected to be an increasing part of public-works financing as governments seek alternative revenue sources to broad-based taxation. Sally Thompson, director of research for TRIP, points out that Texas, California, Colorado, Florida, and Virginia are among the states that have turned to various forms of private financing, "shifting more and more of the capital costs of growth to developers and residents."

One example of this is private-sector financing of specific projects. Data General Corp., for example, is negotiating with local authorities on a plan under which it would finance construction to relieve traffic congestion around its Westboro, Mass., headquarters, about 30 miles west of Boston. "The problem has developed as a result of an explo-

Planes in line to take off from Los Angeles illustrate worsening air-travel tie-ups. Seriously congested airports will soar to 58 by 2000, up from 16 in 1986, says the FAA.

sion in development of the land where Data General is located without any parallel enlargement in the state's public-access highway system," says Brad Stroup, director of public affairs for Data General.

In a number of jurisdictions, impact fees are assessed as a mandatory form of cost sharing. According to a TRIP report, "In Orange County, Calif., for example, developers in three corridors in which freeways are to be built are required to pay impact fees in proportion to the amount of traffic their project is expected to generate."

For some state governments, greater use of toll roads is viewed as one way to address the financing dilemma of rebuilding and expanding the road network. (See the box on Page 19.)

There is growing support among business people for shifting more public-works costs from taxpayers generally to users of the facilities: Eighty-two percent of the delegates to the 1989 annual meeting of the U.S. Chamber of Commerce said they would favor increased user fees to provide better highways.

Yet even as business groups press Congress to preserve the integrity of the trust funds, some lawmakers are calling for higher gasoline taxes that would be used as general revenue to reduce the federal budget deficit and would not be earmarked for highways.

Any such tax increase would derail many initiatives for increasing funding for state highway-improvement programs, particularly in those states that use fuel taxes for funding highway projects, says William Kelleher, manager of community resources for the U.S. Chamber of Commerce.

The Chamber's plan for restoring the infrastructure is generally representative of proposals being advanced by the many other organizations involved in this key public-policy issue. The principal elements:

- Establishment of a mechanism, such as a federal infrastructure bank, to bring effective management to federal contributions to public works, with any new financing arrangement to protect trust funds from political interference and provide that outlays focus on facilities needed in interstate commerce.
- A central role for user fees, wherever possible, in financing construction, maintenance, and rehabilitation.
- Assigning to state and local governments the primary responsibility for design and construction of projects and limiting the federal role in infrastructure rehabilitation to capital financing on a cost-sharing basis with states and localities.
- Where appropriate, providing public infrastructure services through private means or local, self-supporting government agencies on a cost-effective basis.

Several bills to achieve those and other goals for dealing with infrastructure problems are pending in Congress and are expected to get increasing attention as business presses its case for action on this national problem.

Whatever the specific strategies adopted, rehabilitation of the infrastructure will be not only a formidable challenge but also an extremely expensive undertaking.

Richard H. Stanley, president of Stanley Consultants, in Muscatine, Iowa, and a member of the U.S. Chamber's Construction Action Council, says that although the cost is high, the need to mobilize is critical. "We must confront the issue and be prepared to pay the costs," he says.

The Associated General Contractors sums up the issue this way: "The basic reality [is] that America's essential public works are continuing to wear out faster than they are being repaired and replaced. . . . An enormous portion of U.S. economic growth will be lost if steps are not taken immediately to rebuild the infrastructure." ■

The cave-in of a New York City sidewalk after a water-main break last year was a reminder of trouble down below: crumbling water-supply systems in some major cities.

Crumbling America

The U.S. Surface Transportation Infrastructure Crisis

America's transportation infrastructure is crumbling beneath our feet. Decaying and overburdened roads, bridges, highways, airports, waterways and railroads are robbing us of economic vitality.

Mobility, the ability to move people and goods, has always been important to the U.S. because of its size and dispersion of economic activity. In a global economy, making our transportation network efficient and cost-effective is a key to international competitiveness.

As economic boundaries disappear and opportunities spring up overnight, the capacity to move quickly will play a major role in shaping our economic future.

In the 1950s and 1960s, America had a transportation network that was the envy of the rest of the world. It played an important role in enhancing our productivity and keeping costs low. Today, we face a gridlock crisis in our transportation network.

What Went Wrong

Three important trends have come together to create this situation.

- We have not maintained our existing infrastructure, and therefore we have a past due bill for delayed and postponed repair and rehabilitation work.
- The country's demographic and economic patterns have shifted dramatically. We have not built the new facilities to meet the needs of either new growth or the change in our lifestyles or locational patterns.
- The public sector decision-making process has malfunctioned continuously. Congress and the administration have eroded the user fee concept for transportation trust funds by shifting dollars to other program areas and allowing large paper surpluses to develop. State and local governments, along with federal officials, have lacked the political will to undertake long term projects that impose early costs, but provide major long-term benefits.

To solve our total infrastructure problems will require an approximately $3 trillion investment by the year 2020. With a combination of federal user fees, state and local revenues, and privatization, we can meet the financial needs of the system. It will take major coalition building efforts to forge the public-private partnerships necessary to express the political will to get the job done.

Infrastructure Investments

By almost every measure, the U.S. has been reducing its investment in infrastructure. As a share of gross national product (GNP), spending on public capital has dropped from 2.3 percent of GNP in 1960 to less than 1.1 percent in 1985. The U.S. ranks 55th in the world in capital investment in infrastructure. We spend a smaller share of our resources on highway investments than Japan, which relies more heavily on rail transportation than we do.

The net result, said David A. Aschauer, senior economist at the Federal Reserve Bank, is a decline in U.S. competitiveness.

"A root cause of the decline in the competitive position of the United States in the international economy may be found in the low rate at which our country has chosen to add to its stock of highways, port facilities, airports and other facilities which aid in the production and distribution of goods and services."

As shown in chart 1, as our investment in infrastructure has fallen, so has our productivity.

Other measures show a decline in infrastructure investment as well. Absolute dollar amounts invested in infrastructure when measured in 1972 constant dollars fell by 17 percent between 1964 and 1985. When measured on a per capita basis, spending has dropped by 40

(continued on page 6)

Special Report

Infrastructure: Keeping Up with Growth

(continued from page 5)

percent since 1964. Perhaps the clearest way to demonstrate the decline in surface transportation infrastructure investment is to compare some numbers from the 1960s and 1980s. In the 1960s, 12 cents of every dollar spent on automotive transportation went toward roads. In the 1980s, only 6 cents of every dollar has gone toward our road network -- a 50 percent reduction at a time of escalating road use.

Twenty years of underinvestment has lead to the wearing out of the basic systems to support economic growth.

Metropolitan America

The 1980s has been the decade of the suburbs in terms of economic growth. Since 1950, 86 percent of our population growth has taken place in the suburban areas surrounding our central cities. While Americans were deciding they liked the lower density of suburban living, they were also choosing to live in larger metropolitan areas. By the mid-1980s, approximately half the U.S. population lived in 35 areas of 1 million or more and one of three Americans lived in an areas of 2.5 million or more. (Seventy-five percent of all Americans live in metropolitan areas.)

In 1950, only 14 American metropolitan areas had populations of one million or more. These areas contained less than 30 percent of our nation's population.

Jobs moved with population. Between 1960 and 1980, over 60 percent of all job growth took place in suburban areas. In 1960, American suburbs had about 14 million jobs for 35 percent of our employment base. By 1980, the number of jobs had more than doubled to 33 million. Today, as we enter the 1990s, suburbs have 60 percent of all workers and are receiving 67 percent of all job growth.

The impact of these trends can be seen in communities around the country.

- In Gwinnett County, 18 miles outside of Atlanta, the population has grown from 72,000 in 1970 to 250,000 in 1987.
- Oakland County, near Detroit, has [illegible]ived 40 percent of all job growth in Michigan since 1982.
- Tysons Corner, a sprawling Washington, D.C. suburb in Fairfax County, Virginia, has more office space than either Baltimore or downtown Miami.
- This growth in the number of people and jobs in new suburban locations has doubled commuting time and has led to rush hours in the New York metropolitan area that will last for 15 hours a day by the year 2,000.

In addition to shifts in population and job locations, there continues to be a major social shaping of the work force, as the Eno Transportation Foundation Report *Commuting in America* points out.

- Between 1960 and 1980, the working-age population increased by 40 million, an increase of 38 percent, compared to an overall population growth of 26 percent.
- More than twice as many people entered the working-age group between 1970 and 1980 as did in the 1950 to 1960 period.
- In 1950, about one-third of working age women were in the labor force. By 1985, that figure had jumped to almost two-thirds. Of the 50 million new entries into the labor force since 1950, 30 million were women. Women represented only 28 percent of the labor force in 1950; today they exceed 44 percent.
- In those metropolitan areas experiencing high rates of population growth in the 1970s, the growth in workers was far in excess of population growth.
- Phoenix, the fastest growing large metropolitan area in the nation, increased in population by 55 percent between 1970 and 1980. The worker increase was 80 percent, 25 percentage points higher.

This explosion of workers has led to an explosion in commuters. Because of where people are working, we are more dependent than ever on the automobile. We

Special Report

Infrastructure: Tapping the Trust Fund

are faced with a national gridlock problem that is threatening our quality of life and economic vitality.

Public Sector Problems

What happened to the coalitions and programs that built the interstate highway network? At the federal level, efforts to reduce the deficit have led Congress and the administration to use revenues from transportation user fees for other programs. Because these user fees count as revenues to the government, they can be used to make the deficit look smaller. The government has used these funds for other purposes and placed government IOUs in the transportation trust funds that finance federal highway, airport and waterway programs.

The result of this policy has been the accumulation of a $29 billion surplus in trust funds at a time when our bridges and roads are collapsing from under us.

At the state and local level, the shortage of funds has been matched by the expansion of forces that oppose change and development.

Popularly known as NIMBY, Not In My Backyard, these groups seem to oppose any major public capital investment project. They have halted or delayed major road and transportation projects in all parts of the country and have made orderly planning and implementation extremely difficult. State and local elected officials under pressure from these groups often turn their backs on transportation needs and realities. Business needs to help build the public-private partnerships that can respond to anti-growth forces and support public efforts to meet our infrastructure needs.

Consequences

Can we afford to ignore these problems? If we want to remain competitive in a global economy

and enjoy safe and timely travel, the answer is no. The infrastructure problem is at a crisis level now.

- More than 60 percent of the miles of paved highways in the U.S. need some form of surface rehabilitation.
- More than 40 percent of bridges over 20 feet long are structurally deficient or functionally obsolete.
- Highway congestion already is serious in many areas, and the total number of miles travelled annually by vehicles will increase by one-third over the next decade, to 3 trillion.
- By the year 2005, traffic delays caused by inadequate roads will cost the U.S. $50 billion a year in lost wages and wasted gas.

Continued neglect of infrastructure is also costing us jobs and increasing costs. The Port Authority of New York and New Jersey estimated that the region has lost 600,000 jobs as a result of infrastructure deterioration. In Pittsburgh, U.S. Steel estimated that it paid at least $1 million a year in additional costs to detour its trucks 18 miles around a major bridge closed by the state for lack of repair.

The American Society of State Highway and Transportation Officials has estimated that surface transportation demand will at least double by 2020. If we want to continue to maintain at least the current level of service, we must increase our spending to $95 billion a year, up from the current $81 billion being spent by federal, state and local government. (See chart 2 on page 8.)

For America to maintain its economic leadership in the world economy and avoid the negative and costly effects of inaction, we must commit the required funds to improve its transportation system.

Chamber Position

The U.S. Chamber supports continued federal action to provide a transportation system that meets our nation's mobility needs. In shaping actions in this area, we support the following principles:

- There is an immediate need to begin to restore those portions of our basic infrastructure that have fallen into dangerous disrepair. In addition, every effort must be made to begin constructing those projects needed to provide services required to accommodate

(continued on page 8)

Special Report

Infrastructure: Does Congress Have the Will?

(continued from page 7)

growth. Programs to better utilize the existing infrastructure network should be encouraged.

- Infrastructure plans must include adequate methods to finance not only initial construction, but also ongoing maintenance. Much of our current infrastructure problems are the result of neglected maintenance.
- User fees should play a central role in financing our infrastructure construction, rehabilitation and maintenance.
- The design and construction of infrastructure is primarily the responsibility of state and local government.
- The federal role in infrastructure rehabilitation and development should be limited to capital financing.
- The massive infrastructure needs of our nation will require that we establish and enforce priorities for repairing, rebuilding and developing the public works needed to support commerce and protect the public health and safety.
- Where appropriate, provision of public infrastructure services through private means or local authorities should be considered on a cost-effective basis. Privatization can and should play a key role in meeting our public capital needs.
- Establishment of a federal infrastructure bank should be considered by Congress as a method for improving the management of federal contributions to state and local efforts. Federal user fee-financed trust funds for infrastructure such as those for highways and aviation facilities should be taken off budget to ensure that the moneys raised through this method are spent efficiently and effectively and with a minimum of political interference. Capital budgeting should also be considered in managing federal infrastructure investments.

Congressional Outlook

Next year, Congress faces one of its most important challenges in 25 years. The basic legislation covering highway and transit programs will expire. The interstate highway system, which has provided a focal point for this legislation, will be declared complete. This will provide Congress, the administration and the business community with an opportunity to establish new directions and develop new priorities.

Transportation Secretary Samuel K. Skinner is developing a national transportation strategic plan while public and private groups are forming research efforts such as Transportation 2020 to develop input from highway users. Congress will be faced with the challenge of fighting the urge to do business as usual -- funding pork barrel projects and misallocating user fee revenues.

Congress has the opportunity to develop a transportation program that can play a role in restoring our competitive edge and improving the life of every American commuter. To do this, it must clearly define the federal role in transportation to programs of national significance, establish a sound financial base for the program based on user fee financing, and ensure that privatization options exist.

New legislation also should encourage the formation of public-private partnerships at the federal, state and local levels.

Other initiatives in this area include proposals from Rep. William Clinger for capital budgeting and Sen. Daniel Moynihan for establishing an infrastructure bank. Both proposals are efforts to rationalize the spending process and provide stability in resources allocated for public works.

The key questions underlying all debate in this field is whether Congress has the political will to find ways to improve our transportation infrastructure to meet the expectations of the 21st century. Without a sound infrastructure network, we cannot have a strong economy or productive nation. *SW*

CHART 2: Surface Transportation Annual Expenditure Requirements, 1988-2020

Transportation Area	Investment Range (billions) Current	Low	High
Highways, Roads & Bridges	$66.0	$80.0	$100.5
Transit	14.5	15.1	15.8
Linkage to Other Modes	N.A.	1.0	1.0
Total	80.5	96.1	117.3

For more information on infrastructure and transportation, contact William D. Kelleher at the U.S. Chamber, (202) 463-5533.

Sec. 301: To establish a voluntary program which: improves farm income; reduces government costs through higher market prices and targeted program benefits; and recognizes that demand includes an adequate reserve supply.

Sec. 302 et seq.: Voluntary supply management program, using an ARP based on domestic, export, and reserve needs. Payments should be based on total bushels, rather than acreage. Producers should be given the opportunity to prove their actual yields. Effective loan rates should be raised and repeal the Findley amendment. There should be a cap on the total amount of loans and target deficiency available to an individual producer. Provision should be made for a strategic reserve, with any farmer-owned reserve storage payments paid at the same rate as commercial storage. The program would have a cap on target deficiency payments. When a producer elects to stay out of the program one year he must stay out the following year with a loss of 10% base per year.

Subtitle B: Feedgrains

Sec. 401: To establish a voluntary program which: improves farm income; reduces government costs through higher market prices and targeted program benefits; and recognizes that demand includes an adequate reserve supply.

Sec. 402 et seq.: Voluntary supply management program, using an ARP based on domestic, export, and reserve needs. Payments should be based on total bushels, instead of acreage. Producers should be given the opportunity to prove their actual yields. Effective loan rates should be raised and repeal the Findley amendment. There should be a cap on the total amount of loans and target deficiency available to an individual producer. Traditional price relationships among grains need to be recomputed to avoid artificially over encouraging one commodity, e.g. corn, over another, e.g. soybeans. A strategic reserve should be established, with farmer-owned reserve storage payments paid at the same rate as commercial storage. When a producer elects to stay out of the program one year he must stay out the following year with a loss of 10% base per year.

Subtitle C: Effective Dates and conforming amendments

<u>Title 4 Cotton</u> (Staff Contact: Howard Lyman)

Sec. 401: (a) Reauthorize the marketing loan established by the Food Security Act of 1985, with loan rates raised to the target price.

* The changing marketplace is also characterized by new fiscal constraints. Federal financial assistance to mass transportation is on the decline and state and local budgets are heavily constrained. The public dollars that financed the massive growth of public transit over the past two decades are not available to underwrite further expansion of public transit service. Even in jurisdictions that have a dedicated source of revenue to support mass transportation, transit authorities, faced with rising costs and declining ridership, experience difficulties maintaining existing routes, much less aggressively pursuing new markets.

However, not all indicators are negative. The changing marketplace and new transportation demands have also given rise to new entrepreneurial initiative and innovation:

* Public transportation has acquired new sponsors. Transit service is no longer financed solely with tax dollars, but is increasingly underwritten by private sponsors who perceive a benefit from such participation. Private beneficiaries/sponsors include corporate employers who wish to provide commute alternatives to their workers, developers who desire to increase the leasing potential of their properties by providing public transit access to them, and neighborhood groups looking for ways to facilitate inner city residents' access to suburban jobs.

* Secondly, the marketplace has become more competitive. In many communities the public transit authority no longer enjoys a monopoly position. Competing transportation services are being offered by a variety of private and nonprofit providers, including charter bus operators, taxicab companies, specialized transportation providers, social service agencies, business organizations, and community groups.

The Need for Entrepreneurial Transit

In sum, the transportation market has changed fundamentally since the mid-1960s when Congress first enacted the Urban Mass Transportation Assistance Act. Today's travel demands are too diverse and too segmented to be served only by systems that offer a uniform standard of service to all customers. The public utility model created by the 1964 legislation has lost much of its significance in a marketplace characterized by diverse demands, new sponsors, and by user expectations of a high standard of service. Contemporary urban areas need systems that are more market-oriented and offer "customized" services providing a close fit to the needs of particular groups of consumers. In other words, today's circumstances require a more customer driven system of service delivery and a more entrepreneurial approach to service marketing than has typically been provided by traditional transit systems.

Fortunately, private carriers have stepped into the breech and are demonstrating the needed innovation and entrepreneurship. According to an UMTA-sponsored study, Unsubsidized Transit Services: Potential to Meet Public Needs and Reduce Subsidy Requirements (Urban Mobility Corporation, December 1985), no less than 10 metropolitan areas have significant

38-253 O—91——16

commuter bus operations run by private carriers. Among them are New York City, Northern New Jersey, Connecticut, Boston, Chicago, Los Angeles, San Francisco, and Washington D.C. These services, operated with little or no public subsidy, provide a much needed supplement to regular transit services by concentrating on new suburb-to suburb markets that are too small or too distant to be effectively served by public transit systems.

Express commuter services to suburban employment centers are but one type of a growth market served by private entrepreneurs. Other new markets served by private operators include "suburban downtowns," feeder systems to and from suburban commuter rail stations, and reverse commute systems that link central city neighborhoods with suburban employment centers. UMTA's Entrepreneurial Services Program has spawned a number of services in each of these growth markets.

Conclusion

Entrepreneurial services deserve strong federal encouragement and support for several reasons:

- They are customer-driven and are sensitive to the changing demands of the marketplace; thus, they respond more effectively to the changing demographics of urban America;
- They provide a higher standard of service and thus a more meaningful alternative to the automobile;
- They bring creative service approaches and cost-saving management practices to mass transit operations;
- They require little or no government subsidy;
- They open up opportunities for small and minority businesses;
- They supplement rather than replace ongoing public transit services and thus do not threaten existing public transit jobs.

With little likelihood of public transit expansion, and with a progressive diversification of metropolitan travel demand, market-oriented, self-sustaining transit services offer a much needed response to the growing needs for urban mobility and deserve strong federal support and encouragement.

Recommendations

In light of the above, the Entrepreneurial Services Council recommends:

1. The National Transportation Policy should acknowledge the success and importance of entrepreneurial transit services and recognize its potential for improving transit service and reducing transit operating subsidies.

2. There is a need to strengthen the programmatic framework to foster Entrepreneurial Services activities. Specifically:

* The Urban Mass Transportation Administration should strengthen its office of Private Sector Initiatives and provide it with sufficient resources to support an expanded program;

* A legislative set-aside for Entrepreneurial Services projects should be established in the reauthorized Surface Transportation and Relocation Assistance Act. The set-aside should be akin to that created for E&H vehicles under Section 16(b)(2), and for rural transportation under Section 18 of the UMT Act. Initial annual authorization level should be set at a sufficient level to fund a national program.

3. Where public transit authorities are reluctant to sponsor Entrepreneurial Services projects, special efforts should be made to strengthen the capacity of local government to serve as "public sponsors" of Entrepreneurial Service projects. In addition, UMTA should seek legislative authority to broaden the eligibility of recipients authorized to receive Entrepreneurial Services grants. Eligibility should be extended to Metropolitan Planning Organizations, municipal and county Economic Development Agencies, Chambers of Commerce, and other private and non-profit bodies concerned with local economic development.

The environment for this program should reflect a venture capital approach at the federal level, recognizing market discipline and risk/reward consideration. At the local level, a business incubator style is more appropriate. Local sponsors should provide a nurturing and supportive environment for transit entrepreneurs.

4. UMTA should seek a legislative exemption for Entrepreneurial Services grants from the requirements of Section 13(c) of UMT Act. There is no rational basis for requiring a 13(c) sign-off for Entrepreneurial Services projects, since they involve non-traditional services in new markets that do not threaten existing public transit jobs.

The Entrepreneurial Services Council, an independent, non-partisan body, was established in March 1989 to foster development of self-sustaining, market-oriented urban transportation services, and to encourage greater participation of small businesses, community and neighborhood groups, business associations and minority enterprises in the delivery of such services. Council members represent diverse interests, including private providers, minority organizations, consumer groups and neighborhood organizations. The Council pursues its goals through a four-pronged program consisting of:

* *Information exchanges on implementation strategies*
* *Outreach activities designed to enlist new participants in entrepreneurial services activities*
* *Evaluation of the Entrepreneurial Services Program*
* *Elimination of barriers to implementing entrepreneurial services*

The Council is an independent, non-partisan body dedicated to research and educational activities

Chairman: Stephen Blake, National Association of Regional Councils
National Transportation Policy Committee Chairman: William D. Kelleher, U.S. Chamber of Commerce

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

THURSDAY, MARCH 15, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, DC.

The subcommittee met, pursuant to recess, at 10:20 a.m. in room 2167, Rayburn House Office Building, Hon. Norman Y. Mineta (chairman of the subcommittee) presiding.

Mr. MINETA. The Subcommittee on Surface Transportation will please come to order.

This morning we will continue the hearings relative to the establishment of legislation dealing with surface transportation. All of you are very well aware that the Surface Transportation Assistance Act of 1987 expires on the 30th of September, and for the next year and a half or so we will be having hearings, as well as markup sessions, on this issue, a very important one.

During the early phase of this program we will have a number of Members coming to us relative to things that they are interested in terms of that policy. We are pleased to continue having these Members come before us.

Before I proceed let me ask my very fine Republican leader on this subcommittee, Bud Shuster, if he has any opening remarks.

Mr. SHUSTER. Thank you, Mr. Chairman. I am just pleased that we are proceeding. Thank you. If I could, I would like to ask that an opening statement by the distinguished ranking member of the full committee, Congressman Hammerschmidt, be entered in the record.

Mr. MINETA. Without objection, so ordered.

[Mr. Hammerschmidt's prepared statement follows:]

PREPARED STATEMENT OF HON. JOHN PAUL HAMMERSCHMIDT ON REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

Thank you, Mr. Chairman. I want to commend you, Mr. Chairman and Congressman Shuster, for scheduling this third hearing to take a further look at reauthorization of the Federal Highway and Mass Transit Programs.

Based on the testimony already presented to this subcommittee, it is clear that the transportation community has devoted a great deal of time to debating the future of the Federal Highway Program. We see that States are making every effort to solve their transportation problems but feel hamstrung by Federal barriers to the timely and efficient use of Federal funds. We see there are areas of the country that were overlooked in designing the Interstate System and areas where high growth has pressured current systems beyond their capacity.

Today, we will hear from those who move people and goods on our Nation's highways and from those who build them. You are very welcome before our committee, and I look forward to hearing your recommendations.

I also want to extend a warm welcome to my congressional colleagues and our distinguished guest, the Governor of Virginia. I am anxious to hear your suggestions on shaping the future of our highway and transit programs.

Mr. MINETA. At this time we have the very fine gentleman from Alabama, Mr. Erdreich.

Mr. Erdreich, we are pleased to have you here. We have your statement. It will be made a part of the record, so if you would go ahead and proceed in your own fashion.

TESTIMONY OF HON. BEN ERDREICH, A REPRESENTATIVE FROM ALABAMA

Mr. ERDREICH. Thank you, Mr. Chairman. I appreciate the courtesy of letting me testify today, and I thank you and your committee for holding these important hearings.

I am here today to urge that as you move forward with your legislation, the proposed Northern Beltline Freeway in Jefferson County, Alabama, the area that I represent, be included in any surface transportation authorization bill.

A partial beltway currently exists to the south of the city of Birmingham, I-459, which connects I-59 to I-20. We believe that the Northern Beltline, which would be a proposed 41-mile highway designed to complete the loop around the Birmingham area by a northern equivalent of I-459, is essential and important to the growth of our community and important to the national network of road systems that we have across America.

As the initial proponent of this effort in Congress, I am well aware of the vital importance of the project to improving the flow of traffic in and around Jefferson County. But the completion of this freeway, as I said, is also vital to our county and our Nation and our State's economic growth and job development. Again, I would urge that the committee look at this as it proceeds through this deliberation.

Mr. Chairman, local elected officials, under the leadership of the Jefferson County Commission, are committed to the construction of this highway link. Its completion would be a great boost to commercial and residential development in the vicinity of the beltway interchanges and along major corridors. It would also enhance the industrial potential of the area and expand the economic base of the entire metropolitan area.

The Northern Beltline is important to our future, Mr. Chairman. I also believe it is important, as I said, to the continued development of our national network of roads across America.

I thank the subcommittee members for the opportunity to testify. I would ask permission, Mr. Chairman, to also submit for the record a summary of supporting justification for this project that has been prepared by the Metropolitan Planning Organization of the metropolitan area in Birmingham, Alabama.

Mr. MINETA. Without objection, that will be entered into the record.

[The supporting data follow:]

PROPOSED
NORTHERN BELTLINE FREEWAY

BIRMINGHAM, ALABAMA METROPOLITAN AREA

A SUMMARY OF SUPPORTING JUSTIFICATION

PREPARED BY THE
METROPOLITAN PLANNING ORGANIZATION

MARCH 1990

Section 1

INTRODUCTION

On a wall in the Smithsonian Institution's Museum of American History in Washington D.C., hangs a 1921 front page from the old Birmingham Post. The one local story featured on it deals with a dispute over a road; whether a planned U.S. highway should pass through Trussville or Chalkville in northeast Jefferson County. Almost eight decades later no one has found a formula for avoiding pitched battles over the location of highways in the Birmingham Area as the controversy over the location of an Appalachian Highway (Corridor X) has set the project back years.

Unity, however, has been the key word for a project in the Birmingham Area that has been talked about since the days of the identification of the interstate highway system. The Northern Beltline is a proposed 41.3 mile highway designed to complete the loop around the Birmingham Area by being a northern equivalent to I-459.

During the past 20 years, new growth and development in the Birmingham Metropolitan Area has been concentrated primarily in the southern and eastern portions of the urban county (Jefferson). The southern portion of Jefferson County has been in such demand that development has spilled into northern Shelby County for the past decade. Development in the eastern portion of the County accelerated with the completion of I-59 in that area.

Growth in the northern and western portion of the County has occurred at a slower rate in comparison to the southern and eastern areas, inhibited by the lack of an east-west highway (such as the Northern Beltline), land held in large ownership, mining activity in the area, topographic constraints and utility availability.

A "loop" around the northern part of the Birmingham Urban Area will result in a complete beltway. The local elected officials, under the leadership of the Jefferson County Commission, is committed to plan for infrastructure improvements, such as water and sewer, in order that a more balanced pattern of development can take place.

PROPOSED CORRIDOR
FOR
NORTHERN BELTLINE
PRELIMINARY ENGINEERING

Adopted by
Metropolitan Planning Organization
April 1989

Section 2

CONGRESSIONAL FUNDING

In recognition of the realities of highway funding, local elected officials involved in the Metropolitan Planning Organization process under Department of Transportation guidelines have maintained unprecedented unity among local, county and state officials. Starting in 1985, three reports documenting the feasibility of the Northern Beltline were prepared:

(1) Northern Beltline Toll Feasibility Study, prepared for the Jefferson County Public Works Department by PRC Engineering, September 1985.

(2) Northern Beltline Freeway, Technical Analysis for a Year 2000 Transportation Plan Modification, prepared by the Birmingham Regional Planning Commission, March 1986.

(3) Northern Beltline Highway, Jefferson County, Alabama, prepared by Jefferson County Public Works Department, 1988.

Following the lead of the Jefferson County Commission and supported by the technical reports prepared under the guidelines of the local urban transportation planning process, support from Federal sources was requested early in 1988.

In September 1988, the House authorized $675,000 for "expenses necessary to carry out the Alabama Feasibility Study as authorized by section 350 of the Department of Transportation and Related Agencies Appropriations Act, 1988, Public Law 100-202, as amended". Local match in the amount of over $500,000 has been provided in order to conduct the environmental assessment, economic analysis and engineering.

The Alabama Highway Department has contracted with a national transportation engineering firm in order to identify feasible alternates and complete the corridor engineering by late 1991. Included in the scope of work are the following tasks:

- Phase I - base mapping, environmental constraints identification, alternates definition, ground/grade profiles.

- Phase II - interchange location identification, traffic volume projections, traffic analysis.

- Phase III - right-of-way requirements; cost estimates for roadway, bridges and utilities; road user costs; potential economic development; matrices identifying advantages and disadvantages of alternates; public involvement meetings; written analysis on alternates to be carried forward.

- Phase IV - development of selected alternates to determine workability, refinement of preliminary estimates of cost, benefit/cost analysis.

- Phase V - social, economic and environmental studies; draft environmental impact statement; corridor public hearing; final environmental impact statement.

Section 3

SUMMARY OF SUPPORTING TECHNICAL DOCUMENTS

Since 1985, three major supporting technical documents as identified in Section 2 have been prepared as justification for obtaining preliminary engineering funds from Congress. The major findings of these documents are included in this section.

Northern Beltline Toll Feasibility Study, prepared for the Jefferson County Public Works Department by PRC Engineering, September 1985.

In the process of identifying the financial resources available for funding the Northern Beltline the feasibility of using tolls was investigated. The major findings of this study are as follows:

- The total cost to build the Northern Beltline, including engineering, right-of-way and utility relocation costs, is at least $260 million. The cost could be higher if the chosen route is farther from the City, adding to the length of the road.

- If the toll road were financed entirely by 30-year revenue bonds bearing 10 percent interest, the annual debt service would be about $27 million per year.

- Traffic on the Beltline will initially be low, as is natural on a road intended to speed the development of a sparsely populated region. By the year 2000, travel on a free Beltline would be about 448 million vehicle-miles annually.

- If tolls were at levels found acceptable in similar facilities elsewhere, travel in the year 2000 would be about 211 million vehicle-miles annually, producing toll revenues of about $23 million in inflated dollars.

- When adjusted for inflation between now and the year 2000, the toll road operating cost would be about $4 million, assuming highway maintenance and police services are provided by other public agencies. Subtracting this operating cost from the expected revenue leaves about $19 million available to pay debt service in the year 2000. In earlier years with lower traffic, the money available for debt service is even lower.

- Over 30 years, the funds available for debt service are only 65 percent of the amount needed to repay bonds counting the full cost of one road. This percentage varies with the assumptions, but the general conclusion is the same for each scenario: Northern Beltline Toll revenue bonds covering the entire cost of the freeway would be much too risky to attract the necessary funds.

- Tolls can play a role in making the Beltline a reality. They may be able to cover as much as 65 percent of the cost if (1) a credit worthy government pledges its full faith and credit to repay the bonds, (2) other funding sources are found for the remaining 35 percent of the capital cost, and (3) a government agency provides certain services, such as police and roadway maintenance, at no cost to the toll road.

Northern Beltline Freeway, Technical Analysis for a Year 2000 Transportation Plan Modification, prepared by the Birmingham Regional Planning Commission, March 1986.

This report documents the findings of a proposed modification to the Year 2000 Transportation Plan to include the Northern Beltline as a freeway facility within the Birmingham Urban Area.

Before any Federal monies can be expended for engineering, right-of-way, or construction, new major highway projects must be in conformance with the adopted long-range transportation plan for the Birmingham Urban Area. The long-range plan transportation plan identifies major roadways that need to be widened to provide additional capacity between now and the year 2000 and new highway facilities that need to be built to satisfy projected demand.

Four test alternates were presented for consideration and traffic projections developed utilizing modelling based upon demographic information. Population and employment trends from 1974-2010 are outlined as follows:

Year	1980	1987	2010
Population	96,700	102,300	118,700

Year	1974	1984	1989	2010
Employment	18,500	17,000	18,400	23,000

Most of the segments contained in the four alternates tested were viable for freeway-type operation (minimum of 25,000 vehicles per day), with traffic projections in excess of 60,000 vehicles per day in the I-65/Gardendale/U.S. 78 area. Traffic reductions for roadways in the urban area due to the Northern Beltline are significant as outlined as follows:

roadway	reduction (vehicles per day)	% reduction
I-59 West	20,000	20 %
I-59 downtown	10,000	8 %
Carson Rd.	8,600	80 %
East Lake Blvd.	5,000	20 %
U.S. 31	5,000	20 %
Sunhill Road	5,000	50 %
25th Av. NW/NE	5,000	50 %
Lawson Road	4,700	65 %

Northern Beltline Highway, Jefferson County, Alabama prepared by the Jefferson County Public Works Department, 1988

This document is intended to provide information concerning funding options, the economic impact, and actions needed to advance the Northern Beltline.

Concerning funding options, the following alternatives have been analyzed:

- Total Local Government Funding. This concept has been explored; however, revenue levels of the needed magnitude are simply not available and this option has been eliminated.

- Total State Government Funding. This was considered based on the availability of the oil lease windfall funds. This source, combined with some other program, could be feasible, especially under the state's developmental highway program.

- Toll Road Funding. Although a toll facility will not generate sufficient funds to construct the facility, tolls could possibly be combined with some other source of funding to form a realistic funding package.

- Total Federal Funding. Including the project as a line item in the next Surface Transportation Act should be pursued with Congress to supplement the other funding options identified.

The development factors impacting the Northern Beltway include topography; water; sewer; transportation; residential, commercial and industrial land use; and large landholders. The conclusions made from the economic analysis are as follows:

- Limited intensive residential, commercial and industrial development exists primarily in the eastern area and along major U.S. highways.
- East-west access is limited.
- Access to the Tennessee-Tombigbee Waterway via Port Birmingham is provided.
- Railway access is ample.
- Majority of the land is undeveloped and controlled by large corporate land owners.
- Much of the land is relatively steep.
- The area generally lacks public sanitary sewers.
- The area is generally experiencing a growth in population, although at a slower rate than the southern and eastern portion of the county.
- Significant commercial and single-family/multifamily residential development would occur in the vicinity of the beltway interchanges and along major corridors.
- Growth will be promoted only if large landowners give up mineral rights.
- Sewers should follow the growth of the highways and should extend with the extension of water lines.
- The industrial potential of the area would be significantly enhanced, especially in northern Pinson Valley and in the vicinity of Port Birmingham, Appalachian Regional Commission Corridor X and the Northern Beltway.

- The impetus for development would extend beyond Jefferson County into southern Blount and Walker Counties.
- Due to the increased development the tax base of the area would increase accordingly.
- The urban image of the Birmingham Area would be enhanced with the perception of an adequate interstate system complete with a beltline to funnel traffic from the downtown area.
- The economic base of the entire Metropolitan Statistical Area and especially the impacted area would be expanded and strengthened.
- Many of the now isolated communities would be presented with new opportunities for survival.

Section 4

COMPATIBILITY OF NORTHERN BELTLINE WITH NATIONAL TRANSPORTATION STRATEGY PROPOSED BY DOT

In the early 1980s, the job of deciding what to do with the billions of dollars in gas tax revenues, once the Interstates were completed, seemed like deciding on a change of course for an ocean liner steaming through calm seas. But as 1991 approaches and the highway and transit program authorizations are subject to major revisions, it has become apparent that any course will be difficult.

Metropolitan development in the Birmingham, Alabama Metropolitan Area has brought new demands from businesses and their workers, who want roads to link suburbs with other suburbs just as high-speed multi-lane radial routes now link suburbs with the central area.

The documented shortage in "primary and urban" funding for non-interstate roadways has resulted in some major developmental roadways within the Birmingham Area, including the Northern Beltline, to be essentially unfundable.

The national transportation strategy announced by Department of Transportation Secretary Samuel Skinner in January 1990 calls for (1) a stronger, healthier partnership among federal, state and local governments, (2) creative ways to apply the time tested user fee principle, (3) more private investments, (4) removal of unnecessary regulations, and (5) new technology and more support for efforts in research and development.

Though suburban traffic congestion and traffic demand make the proposed Northern Beltline Freeway feasible, the real demand for this type of highway project is economic vitality. The national surface transportation program should preserve and enhance the economic vitality of this nation by providing employment, reducing transport costs, improving freight movement productivity, revitalizing rural areas, rejuvenating blighted urban areas, attracting economic development and providing transportation for rapidly growing regions. These policies, recommended for the future federal surface transportation program by the American Association of State Highway and Transportation Officials, are supported in the goals for the proposed Northern Beltline.

Mr. ERDREICH. Thank you, Mr. Chairman. Those are my entire oral remarks. I thank you for the courtesy of letting me attend.

Again, I would urge the committee's favorable consideration of this project and projects like it as you move forward in what I believe are very critical deliberations for surface transportation for this country's future through the 1990s and into the 21st century.

Thank you very much, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Erdreich, for your fine statement.

During the last several years, with your leadership, this committee has attempted to support your efforts to advance this project within the State of Alabama. I'm just wondering, given the fact that studies have shown that the Northern Beltline is not feasible as a toll facility, do you think that the use of Federal funds here along with toll revenues would enhance the viability of this project as a toll facility?

Mr. ERDREICH. That is certainly a possibility. Indeed, the summary of supporting justification that I submitted for the record indicates that as one path that could be taken, Mr. Chairman. I know that is one of the options that the committee and the Congress are being asked to look at. It could not support itself as a toll road solely. Federal funds are direly needed in order to supplement what could be that local match coming from toll or other resources. That would be an option that the local governing body would view as an option. It could be partially funded by that method. They would certainly look with favor upon that sort of opportunity if such a program were put in place, Mr. Chairman.

Mr. MINETA. Very well.

Mr. Shuster?

Mr. SHUSTER. Thank you for your testimony. I have no questions.

Mr. ERDREICH. Thank you.

Mr. MINETA. Mr. Rahall?

Mr. RAHALL. I have no questions, Mr. Chairman.

Mr. MINETA. Mr. Grant?

Mr. GRANT. No questions, Mr. Chairman.

Mr. MINETA. Mr. Bosco?

Mr. BOSCO. No questions, Mr. Chairman.

Mr. MINETA. Mr. Clement?

Mr. CLEMENT. Tell me exactly where this road would run.

Mr. ERDREICH. This is the completion of—what we have in Jefferson County, Alabama, Bob, is really half a beltway. We've got a southern beltroad that is in the south of Jefferson County, Alabama. This would continue that and complete it as the so-called Northern Beltline. It would be in the north of Jefferson County. It would provide tremendous new access through the county, relieve what really is an overly congested center county interstate system, which is I-59 and I-20 running through the center of our county. It would provide access toward Nashville. It would provide a better transportation net, really, from the north of our county to our neighboring counties and neighboring States.

Again, to me it would be an enhancement of our existing interstate system, make that more efficient, and be a benefit not just to Jefferson County and Alabama but to neighboring States such as Tennessee and throughout the interstate network system.

Mr. CLEMENT. Thank you.

Mr. MINETA. Very well. Thank you very much, Mr. Erdreich.

Mr. ERDREICH. Thank you very much, Mr. Chairman, for your courtesy. Thank you all.

[Mr. Erdreich's prepared statement follows:]

STATEMENT OF
THE HONORABLE BEN ERDREICH
before the
SUBCOMMITTEE ON SURFACE TRANSPORTATION
OF THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

Thursday, March 15, 1990
10:00 a.m.

MR. CHAIRMAN, I AM HERE TODAY TO REQUEST THAT THE PROPOSED NORTHERN BELTLINE FREEWAY IN JEFFERSON COUNTY, ALABAMA, WHICH I REPRESENT, BE CONSIDERED FOR INCLUSION IN THE NEXT SURFACE TRANSPORTATION AUTHORIZATION BILL.

A PARTIAL BELTWAY CURRENTLY EXISTS TO THE SOUTH OF THE CITY OF BIRMINGHAM, I-459, WHICH CONNECTS I-59 TO I-20. THE NORTHERN BELTLINE IS A PROPOSED 41.3 MILE HIGHWAY DESIGNED TO COMPLETE THE LOOP AROUND THE BIRMINGHAM AREA BY BEING A NORTHERN EQUIVALENT TO I-459.

AS THE INITIAL PROPONENT OF THIS EFFORT IN CONGRESS, I AM WELL AWARE OF THE VITAL IMPORTANCE OF THE PROJECT TO IMPROVING THE FLOW OF TRAFFIC IN AND AROUND JEFFERSON COUNTY. BUT THE COMPLETION OF THIS FREEWAY IS ALSO VITAL TO OUR COUNTY'S ECONOMIC GROWTH AND JOB DEVELOPMENT, PARTICULARLY IN THE NORTHERN PART OF THE COUNTY.

NEW GROWTH AND DEVELOPMENT IN THE BIRMINGHAM, ALABAMA METROPOLITAN AREA MAKES THE COMPLETION OF THIS ROADWAY A PRIORITY FOR FURTHER ECONOMIC DEVELOPMENT OF OUR AREA.

DURING THE PAST 20 YEARS, THIS GROWTH AND DEVELOPMENT HAS BEEN CONCENTRATED PRIMARILY IN THE SOUTHERN AND EASTERN PORTIONS OF THE URBAN COUNTY. THE SOUTHERN PORTION OF JEFFERSON COUNTY HAS BEEN IN SUCH DEMAND

THAT DEVELOPMENT HAS SPILLED INTO NORTHERN SHELBY COUNTY FOR THE PAST DECADE. DEVELOPMENT IN THE EASTERN PORTION OF THE COUNTY ACCELERATED WITH THE COMPLETION OF I-59 IN THAT AREA.

GROWTH IN THE NORTHERN AND WESTERN PORTION OF THE COUNTY HAS OCCURRED AT A SLOWER RATE IN COMPARISON TO THE SOUTHERN AND EASTERN AREAS, DUE IN LARGE PART TO THE LACK OF AN EAST-WEST HIGHWAY, SUCH AS THE NORTHERN BELTLINE, LAND HELD IN LARGE OWNERSHIP, MINING ACTIVITY IN THE AREA, TOPOGRAPHIC CONSTRAINTS AND UTILITY AVAILABILITY.

IN SEPTEMBER 1988, THE HOUSE AUTHORIZED $675,000 FOR A FEASIBILITY STUDY, AND WITH A LOCAL MATCH OF OVER $500,000, EFFORTS ARE CURRENTLY UNDERWAY TO COMPLETE THAT STUDY AND CORRIDOR ENGINEERING BY LATE 1991.

LOCAL ELECTED OFFICIALS, UNDER THE LEADERSHIP OF THE JEFFERSON COUNTY COMMISSION, ARE COMMITTED TO THE CONSTRUCTION OF THIS HIGHWAY LINK. ITS COMPLETION WOULD BE A GREAT BOOST TO COMMERCIAL AND RESIDENTIAL DEVELOPMENT IN THE VICINITY OF THE BELTWAY INTERCHANGES AND ALONG MAJOR CORRIDORS. IT WOULD ALSO ENHANCE THE INDUSTRIAL POTENTIAL OF THE AREA AND EXPAND THE ECONOMIC BASE OF THE ENTIRE METROPOLITAN AREA.

THE NORTHERN BELTLINE IS IMPORTANT TO THE FUTURE OF JEFFERSON COUNTY, ALABAMA. I THANK THE SUBCOMMITTEE MEMBERS FOR THIS OPPORTUNITY TO TESTIFY THIS MORNING, AND URGE YOU TO INCLUDE THE PROPOSED NORTHERN BELTLINE FREEWAY IN THE NEXT SURFACE TRANSPORTATION AUTHORIZATION BILL.

Mr. MINETA. At this time I would like to call forward the very distinguished gentleman from Pennsylvania, Congressman Schulze. Congressman Schulze, as all of you know, is a very powerful member of the Ways and Means Committee.

It is nice to have you before us, Congressman. Your statement will be made a part of the record. You may go ahead and proceed in your own fashion.

STATEMENT OF HON. RICHARD T. SCHULZE, A REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA

Mr. SCHULZE. Thank you very much, Mr. Chairman. It is a privilege and an honor to appear this morning before this distinguished, powerful, august committee.

Mr. Chairman, I do appreciate and thank you for the opportunity to testify today on the most urgent transportation need of southeastern Pennsylvania, the building of the Exton Bypass. This bypass would help a region that is an excellent case study in how transportation problems can gridlock suburban mobility.

In 1792, the Philadelphia and Lancaster Turnpike Road Company began construction of the first turnpike in America. The 50-foot-wide, 62-mile-long turnpike cost $465,000 and opened in 1795. In Chester County the alignment of that road roughly parallels what is now U.S. Route 30. Where 200 years ago the travelers had a reliable east-west roadway through the region, today they do not. Let me explain why.

From 1970 to 1990, Chester County's population increased about 30 percent. Employment rose more than 60 percent. In the past 10 years both Chester County vehicle registration and vehicle miles of travel increased 30 percent. The percentage of urban area in the county has gone from 22 percent in 1980 to approximately 45 percent today.

As these statistics suggest, development has been intense, if not severe. Chester Valley has become the "high tech" corridor of the Philadelphia area. Development proposals over the last three years alone could consume 19 percent of the county. In fact, within the five-mile alignment of the bypass, 8,500 dwelling units and 18.5 million square feet of additional office, commercial, or industrial space are proposed. This would generate another 375,000 trips per day. Add that to the 110,000 trips per day already passing through Exton. Of these trips, about 60 percent of the traffic comes from vehicles having neither an origin nor a destination in the area.

During this dynamic expansion, where U.S. 30 simply continued to carry a heavier traffic burden without improvement, the community did not ignore the growing problem. Instead, the community pleaded for State funds. For more than 25 years the residents of Chester County have asked the Commonwealth of Pennsylvania to alleviate the heavy traffic.

This could easily be accomplished by extending U.S. Route 202 at its interchange with existing U.S. Route 30 west for five miles, past Pennsylvania Route 100, to the interchange of the Downingtown Bypass and U.S. Route 30. In effect, the residents want the three limited access highways directly linked by a four-lane divided highway. This would end the highway gap that generates extreme sub-

urban mobility problems. For now, regrettably, the residents continue to wait.

Mr. Chairman, U.S. Route 30 needs help and it needs it now. The corridor is the most significant non-toll roadway west from Philadelphia to south-central Pennsylvania, and is a critical link to Harrisburg, York, and Lancaster.

The construction of the Exton Bypass is the number one transportation priority of the Chester County government. The community support is unanimous. The new highway has been formally supported by regional councils, chambers, business organizations, and regional planning commissions.

Local business interests, worried about workforce accessibility and potential for growth, have also united behind the project, committing themselves to financing a portion of the utility relocation. In fact, from the Ports of Philadelphia and Wilmington to central Pennsylvania, commerce is relying on the construction of this bypass.

In Harrisburg, the State Department of Transportation designated the Exton Bypass as a "Highway of National Significance." The Pennsylvania Secretary of Transportation wrote to me this past December that he and Governor Casey will "continue to work cooperatively at the Federal, State, and local levels to find ways to advance this important project."

Noting the hazard of mixing high-density local and regional traffic on a three-lane highway, the State has also identified the U.S. Route 30 corridor as one of the 55 highest accident corridors in Pennsylvania.

The United States Congress has recognized the need for the Exton Bypass, as well. The Interstate Transfer-Highway Allocations section of the Department of Transportation and Related Agencies appropriation bill in 1990 says, "The committee directs that of the amount allocated to Pennsylvania, priority consideration should be given to the completion of the Exton Bypass." The Senate version of the same bill says, "The committee is aware of the traffic congestion in the Exton, Pennsylvania area and recommends that discretionary funding be expended to alleviate this problem."

I refer you to the map, put up by my assistant, entitled "Modal Integration Concept." As you can see, the point where the bypass and U.S. Route 202 connect holds great potential as an interchange area, ideal for modal integration, a concept included in the U.S. Department of Transportation's national strategy. You are well aware of that.

Presently, there are three public transportation systems which operate through the area: train and bus lines of Southeastern Pennsylvania Transportation Authority, and Amtrak. Negotiations are already underway for a privately-financed commuter rail station on the land immediately adjacent to the Exton Bypass/U.S. Route 202 interchange.

Mr. MINETA. Dick, before you proceed could you have one of your assistants point that out for us, the SEPTA/Amtrak routes?

Mr. SCHULZE. That's what he's now doing. This initiative is exactly the type of intermodal improvement critical to meeting the ob-

jectives that Secretary Skinner and this subcommittee have pointed out time and time again.

Rarely in our public lives do we encounter such total agreement on any topic. This is one case. So why do the travelers of Chester County continue to be stranded daily in traffic stand-stills? The answer is funding.

Currently, the bypass is in phase one of a three-phase, twelve-year plan which began in 1988. The total cost is approximately $100 million. The money for phase one that comes from the interstate transfer program will be spent with a formula of 85 percent Federal and 15 percent State. Other available money for phase one will be split 75 percent Federal and 25 percent State, from the Federal-aid Primary Fund. The second and third phases will be spent 75 percent Federal and 25 percent State, and local money will cover portions of the utility relocation.

Complete design, environmental impact studies, and acquisition of right-of-way comprise phase one, which began in 1988 and ends in 1992. Slated for second phase work is utility relocation and construction. Phase three will complete construction, hopefully by the year 2000.

Well, there are two major problems with this schedule. For one, the construction costs exceed the program MED funds by $20 million to $25 million. Secondly, money that is programmed is not available soon enough to make a difference. At this rate, it will probably take 35 years to build just 5.5 miles of essential highway.

As I sit before this subcommittee today, the environmental impact statement has already been signed by the Federal Highway Administration. The right-of-way acquisition is 99 percent complete. The design aspects are more than 50 percent finished. The utility relocation will be accomplished by 1991.

Mr. Chairman, the Exton Bypass is ready to be constructed next year. I propose to this subcommittee that the Exton Bypass receive $73.7 million in Federal funds. This money would enable the Pennsylvania Department of Transportation to award construction contracts for the entire five-mile highway. At the latest, the citizens and businesses throughout the corridor would be utilizing their new highway by 1994.

Mr. Chairman, I thank the subcommittee for the opportunity to detail this most pressing transportation problem in southeastern Pennsylvania. I urge the subcommittee to fund the immediate completion of this bypass, to not only relieve my constituents, but Pennsylvania drivers in that immediate area, from this massive gridlock.

Thank you for your consideration. I would be happy to answer any questions.

Mr. MINETA. Thank you very much, Congressman Schulze.

Your statement reflects strong Federal, State, and local support for the expedited completion of this Exton Bypass. There is strong support for completion of the Exton Bypass, especially in the use of Federal-aid funds for this, but I would like to ask, is it your belief that if funds were readily available to the State, that this project could be completed within the next three years?

Mr. SCHULZE. Absolutely, Mr. Chairman.

Mr. MINETA. And other than the outlining of the fund that you were talking about, in terms of the locals doing the relocation of utilities, do you think that there's any chance of any additional resources being committed from the local sector, given the fact that—you talked about the 18.5 million square feet and all the dwelling units that would be going in there—it seems to me that we have to participate in these programs, but if the surge is really coming from local development, I'm wondering to what extent there may be a stronger local commitment other than the 85/15 or 75/25?

Mr. SCHULZE. Under the modal integration concept, private funds are prepared, if this project moves forward, to build a rail station and do things which normally would come under, perhaps, public funding.

So the answer to your question is yes, I believe that it is an opportunity for some concepts—I perhaps would not use the word "experimentation," but perhaps breaking new ground in the field of transportation and related fields through cooperation with the private sector.

Mr. MINETA. Are there any local developmental funds imposed on the development community?

Mr. SCHULZE. No, there are not. That has been discussed, but most of the developers in the area have been extremely cooperative with county officials, either in changing plans or with financial contributions, so——

Mr. MINETA. They are making some form of financial commitment?

Mr. SCHULZE. Yes.

Mr. MINETA. Thank you very much, Mr. Schulze.

Mr. Shuster?

Mr. SHUSTER. Thank you very much. I certainly welcome my good friend and colleague from Pennsylvania.

Mr. Chairman, I have been to this location and have inspected it. I can underscore first hand everything that Congressman Schulze says about the vital need for this project to be completed quickly.

Congressman, I am very pleased to hear from your report that the Pennsylvania Department of Transportation has designated this as a "Highway of National Significance." I know, again first hand, of the tremendous effort on your part to make that come true and the high priority that you give to this important project.

It is my hope that as we proceed here with the authorization of new highway and transit legislation, which will probably come to fruition in 1991 legislation, that we can indeed adopt what might be called a National Highway System which will encompass the Highways of National Significance, something akin to what the Interstate System has been in the past. Of course, the first leg of that would be the Interstate System, but it would identify those other highways. The fact that you through your efforts have been able to get the State to designate this says that we should be on the way to including this, hopefully in that fashion, so that it would be designated for funding. But if for some reason not in that fashion, there are other means and ways that we will have to use, because I vigorously support what you are attempting to do.

Mr. SCHULZE. Let me just say that I not only appreciate the support that this subcommittee and the staff have given, but also per-

sonally from you, Mr. Shuster. You and your staff have been most generous with your time and cooperation.

Mr. SHUSTER. Well, thank you very much.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Bosco?

Mr. BOSCO. Thank you, Mr. Chairman.

I also thank our colleague from Pennsylvania. I have not been to the site; in fact, I can barely see it from here. [Laughter.]

But I think that you make a very strong case. Sometimes we tend to think of highways as just paving and something that doesn't affect people's lives all that much, but when you think of the wealth and prosperity that can be created for that entire region by this stretch of road, it is an investment like none other that the Government can make. I, for one, thank you for being here.

Mr. SCHULZE. If that highway had been there, George Washington would not have had to suffer that winter in Valley Forge. [Laughter.]

Mr. BOSCO. You know, our committee certainly would have wanted to prevent any suffering on his part.

Thank you very much for your presentation.

Mr. MINETA. Mr. Grant?

Mr. GRANT. No questions, Mr. Chairman.

Mr. MINETA. Mr. Laughlin?

Mr. LAUGHLIN. Dick, thank you very much for being here.

One item of your testimony that really struck a chord with me was when you were talking about the traffic delays and the cost to business in productivity. If you take that and spread it around nationwide, it really is a strong endorsement of why we have a responsibility to our country, both in the economic arena and the defense arena, for improving our infrastructure.

So I thank you for your comments and appreciate your being here.

Mr. SCHULZE. My pleasure.

Mr. MINETA. Mr. Clement?

Mr. CLEMENT. Nothing, Mr. Chairman.

Mr. MINETA. Mr. Skaggs?

Mr. SKAGGS. No questions, Mr. Chairman.

Mr. MINETA. If there are no further questions, thank you, Mr. Schulze, very, very much.

Mr. SCHULZE. Thank you, Mr. Chairman.

[Mr. Schulze's prepared statement follows:]

PREPARED TESTIMONY OF HON. RICHARD T. SCHULZE—THE EXTON BYPASS

Mr. Chairman, I want to thank you for the opportunity to testify today on the most urgent transportation need of Southeast Pennsylvania, the building of the Exton Bypass. The bypass would help a region that is an excellent case study in how transportation problems can gridlock suburban mobility.

In 1792, the Philadelphia and Lancaster Turnpike Road Company began construction of the first turnpike in America. The 50 foot wide, 62 mile long turnpike cost $465,000 dollars and opened in 1795. In Chester County, the alignment of that road roughly parallels what is now U.S. Route 30. Where two hundred years ago the travellers had a reliable east-west roadway through the region, today they do not.

Let me explain why. From 1970 to 1990, Chester County's population increased about 30 percent. Employment rose more than 60 percent. In the past ten years, both Chester County vehicle registration and vehicle miles of travel in the county

increased 30 percent. The percentage of urban area in the county has gone from 22 percent in 1980 to approximately 45 percent today.

As these statistics suggest, development has been intense. Chester Valley, of which U.S. Route 30 is an integral part, has become the "hi-tech" corridor of the Philadelphia area. Development proposals over the last three years alone could consume 19 percent of the county. In fact, within the five mile alignment of the bypass, 8,500 dwelling units and 18.5 million square feet of additional office, commercial or industrial space are proposed. This would generate another 375,000 trips per day added to 110,000 trips per day already passing through Exton. Of these trips, consider that 60 percent of the traffic comes from vehicles having neither an origin nor a destination in the area.

During this dynamic expansion, U.S. Route 30 simply continued to carry a heavier traffic burden, without improvement. The community did not ignore the growing problem; instead, the community pleaded for state funding.

For more than 25 years, the residents of Chester County have asked the Commonwealth of Pennsylvania to alleviate the heavy traffic. This could easily be accomplished by extending U.S. Route 202 at its interchange with existing U.S. Route 30 west for five miles, past Pennsylvania Route 100 to the interchange of the Downingtown Bypass and U.S. Route 30. In effect, the residents want the three limited access highways directly linked by a four-lane divided highway. This would end the highway gap that generates extreme suburban mobility problems. For now, regrettably, the residents continue to wait.

Mr. Chairman, U.S. Route 30 needs help and needs it now. The corridor is the most significant non-toll roadway west from Philadelphia to south-central Pennsylvania, and is a critical link to Harrisburg, York and Lancaster.

The construction of the Exton Bypass is the number one transportation priority of the Chester County government. Community support is unanimous. The new highway has been formally supported by regional councils, chambers, business organizations and regional planning commissions.

Local business interests—worried about workforce accessibility and potential for growth—have also united behind the project, committing themselves to financing a portion of the utility relocation. In fact, from the Ports of Philadelphia and Wilmington to central Pennsylvania, commerce is relying on the construction of this bypass.

In Harrisburg, the state Department of Transportation designated the Exton Bypass as a highway of "national significance." The Pennsylvania Secretary of Transportation wrote to me this past December that "Governor Casey and I will continue to work cooperatively at the federal, state and local levels to find ways to advance this important project."

Noting the hazard of mixing high density local and regional traffic on a three lane highway, the State has also identified the U.S. Route 30 corridor as one the 55 highest accident corridors in Pennsylvania.

The United States Congress has recognized the need for the completion of the Exton Bypass as well. The Interstate Tranfer-Highway Allocations section of the House of Representatives Department of Transportation and Related Agencie Appropriations Bill, 1990, says, "The Committee directs that of the amount allocated to Pennsylvania, priority consideration should be given to completion of the Exton Bypass."

In the Senate version of the same bill, the necessity for Exton Bypass is recognized with the following language: "The Committee is aware of the traffic congestion in the Exton, Pennsylvania area and recommends that discretionary funding be expended to alleviate this problem."

The Exton Bypass also easily lends itself to the improvement of suburban mobility. The point where the bypass and U.S. Route 202 connect holds great potential as an interchange area ideal for modal integration, a concept included in the U.S. Department of Transportation's national strategy.

Presently, three public transportation systems operate through the area: the train and bus lines of Southeastern Pennsylvania Transportation Authority (SEPTA), and AMTRAK. By train, the SEPTA commuter rail line runs between the Downingtown Borough and Philadelphia, while Amtrak provides service from Philadelphia to Harrisburg, Pittsburgh and points west. The SEPTA bus route cuts directly through this location, serving the King of Prussia area.

Already, negotiations are underway for a private financed commuter rail section on the land immediately adjacent to the Exton Bypass/U.S. Route 202 interchange. This type of intermodal improvement initiative is critical to meeting policy objectives of Secretary of Transportation Samual Skinner and this subcommittee.

Rarely in our public lives do we encounter such total agreement on any topic. This, however, is one such case. So why do the travellers of Chester County continue to be stranded daily in traffic stand-stills? The answer, of course, is funding.

Currently, the bypass is in phase one of a three-phase twelve-year plan that began in 1988. The total cost is approximately $100 million. The money for phase one that comes from the interstate transfer program will be spent with an 85 percent federal and 15 percent state formula. Other available money for phase one will be split 75 percent federal and 25 percent state, from the federal aid primary fund. The second and third phase will be spent 75 percent federal and 25 percent state. Local money will cover portions of the utility relocation.

Beginning in 1988, complete design, environmental impact studies, and acquisition of right of way comprise phase one. During the second phase, from 1992 to 1996, utility relocation and construction are slated to take place. If the money can be found, phase three will complete construction, hopefully by the year 2000. However, the construction costs exceed the programmed funds by $20 to $25 million, and the funds that are programmed are not available soon enough.

If we continue forward at this pace it will take 35 years to build just 5.5 miles of essential highway.

As I sit before this subcommittee today, the environmental impact statement is completed and signed by the Federal Highway Administration. The right of way is 99 percent complete. The design aspects are more than 50 percent complete. The utility relocation will be accomplished in 1991. Mr. Chairman, the Exton Bypass is ready to be constructed next year.

I propose to this subcommittee that the Exton Bypass receive $73.7 million in federal funds. This money would enable the Pennsylvania Department of Transportation to award construction contracts for the entire five-mile highway. At the latest, citizens and businesses throughout the corridor would be utilizing their new highway by 1994.

Again, I thank the subcommittee for the opportunity to detail the most pressing transportation need of Chester County. I urge the subcommittee to fund the immediate completion of the Exton Bypass, and relieve my constituents and Pennsylvania drivers from massive gridlock.

Thank you for your consideration.

Mr. MINETA. At this time I would like to call on a very fine Member, Mrs. Smith from Nebraska, if you would please come forward.

Mrs. Smith, do we have a copy of your testimony?

Mrs. SMITH. Yes, you do.

Mr. MINETA. Thank you. If you would go ahead and proceed, I will make your statement a part of the record.

TESTIMONY OF HON. VIRGINIA SMITH, A REPRESENTATIVE FROM NEBRASKA, ACCOMPANIED BY DAVID NITSCHKE, M.D., PRESIDENT, REGIONAL WEST MEDICAL CENTER, SCOTTSBLUFF, NE, AND KATHI SWANSON, M.D., REPRESENTATIVE, HEARTLAND EXPRESSWAY SUPPORTERS

Mrs. SMITH. Thanks, Mr. Chairman, Mr. Shuster, and all the members of the committee. I do appreciate this opportunity to appear before you this morning on behalf of two very important pieces of legislation.

First I want to briefly outline a bill I introduced last session, H.R. 368, the Rural Transportation Equity Act of 1989. This bill was designed to focus attention on the unique intercity transportation needs of rural America, which actually have been largely ignored by the Urban Mass Transit Administration.

For instance, while 38 percent of the Nation's population live in rural areas, and while rural Americans tend to be more elderly and have lower income than the population in general, rural America received 3.95 percent of total mass transit formula funds

in 1989. That's less than 4 percent of the funds for 38 percent of our population.

My bill would bring greater equity in transit funds by increasing rural America's share of mass transportation funds to 6 percent. This shift in funding would be used in conjunction with another provision of the bill, which would establish a new State-administered block grant program for rural and small urban areas, designed to raise funding for those areas by 50 percent.

In addition, my bill would establish a "Rural Mobility Working Group" within UMTA to ensure coordination of all UMTA activities with an impact on rural and specialized transportation.

Mr. Chairman, I would like to submit additional information on this bill for the record.

Secondly, I would like to tell you about an exciting project being undertaken in Nebraska's panhandle, the Heartland Expressway. This proposed four-lane expressway would stretch from Rapid City, South Dakota through western Nebraska to Interstate 80 at Kimball, and would provide a much-needed transportation and economic development link for this rural area.

Funds are needed at this point for a corridor study of the area. The local people are currently raising funds for this study, and the State has pledged $100,000.

Two Nebraskans have traveled to Washington today on behalf of the Heartland Expressway supporters. David Nitschke is the President of the Regional West Medical Center in Scottsbluff, Nebraska. This facility is very, very important to the western half of our State, people who do not have access to health care in their own small communities. An expressway through Scottsbluff would strengthen significantly the accessibility of folks in western Nebraska to quality health care. I am pleased that David has made this special effort to come and be with us today, to share in asking questions. However, he has chosen—and Dr. Kathi Swanson has chosen—that she, an official representative of the Heartland Expressway Supporters, will provide this subcommittee with testimony and additional information on the record about this endeavor, which is so important to my Congressional District. I present Dr. Kathi Swanson.

Mr. MINETA. Dr. Nitschke, Dr. Swanson, we are pleased to have you here. You are ably represented by Congresswoman Smith, so if you would go ahead and proceed in your own fashion, please.

Dr. SWANSON. Thank you very much, Mr. Chairman, and thank you, Mrs. Smith.

I would also like to introduce Wes Shelton, on your left, helping us hold our map, from our Rapid City delegation in this unified effort, and also Chuck Vanderzill.

In order to bring rural development opportunities to western Nebraska and to aid in the growth in western South Dakota, we are requesting $1 million in Federal demonstration funds for a corridor study to examine the feasibility of a proposed four-lane expressway—not interstate—route from Denver, Colorado to Rapid City, South Dakota through the panhandle of Nebraska. This proposed route would connect north-south three major interstates and cities in the west: Denver via I-25 to I-80 at Cheyenne, Wyoming, to Kimball, Nebraska, to I-90 in Rapid City, South Dakota.

The Governor and the State of Nebraska have already committed to build the first link of this expressway with State funds, the Highway 71 section between Kimball and Scottsbluff. The 22 communities along this route in the States of Nebraska and South Dakota have pledged over $220,000 for the match funding for the Federal demonstration project for the corridor study.

By examining the population density map of the western area one can see the highest population concentrations. Denver is the major trade center for this region, and most commerce flows in and out of Denver. If you overlay the current Interstate System you can see that the most dense areas in Nebraska and South Dakota, the western end, are not connected to Denver by a suitable four-lane route. This expressway would connect the four most dense population areas: Denver to Cheyenne to Scottsbluff to Rapid City, South Dakota. This expressway would connect over 3 million people and provide access to over 20 million visitors to tourism and markets.

In order for rural areas to participate in the growth in the urban centers, a recoupling between the urban and rural centers has to occur. Our areas have the advantages that today's manufacturers are looking for: efficient labor, high quality of life, cheap energy, good educational systems, and health care. However, for the rural areas to participate in the growth that the urban regional centers have been experiencing there has to be a modern highway system for the movement of people and goods into major markets.

The Black Hills area supporters view the proposed four-lane expressway, beginning at Kimball, as a natural draw for tourists into the Black Hills. Tourists would be encouraged to experience the Oregon Train, with the rich history of the old west available in the panhandle of Nebraska. The area is rich in National Parks and recreation areas and in entrepreneurial endeavors. Improvements in Scottsbluff National Monument, Chimney Rock Visitors Center, Agate Fossil Beds, and Fort Robinson are underway at local, State, and Federal levels.

The Nation's shrine of democracy, Mount Rushmore, is located in the Black Hills of western South Dakota. This awe-inspiring national memorial hosts over 2 million visitors per year. Yet, as important as it is, the American Automobile Association can't provide a trip map showing a route to reach Mount Rushmore from Denver, which is our major metropolitan market.

While some national writers deride the status of the west, the fact remains that the economy of Rapid City is outperforming the Nation's economy in several respects. Our manufacturing employment and our overall employment have been growing faster than the rest of the Nation. Pennington County, at the north end of this corridor, had a population growth rate of 16.4 percent in the 1980s. This growth is putting strains on our infrastructure, and it will continue.

People who travel one segment of this proposed highway display bumper stickers reading, "I Survived Highway 79." Current traffic counts on this two-lane section of road south of Rapid City, which would become a part of the expressway, are almost equal to the traffic counts on Interstate 90 in South Dakota.

We have reasonable access to the east and west, but north-south transportation is at a serious disadvantage. Manufactured prod-

ucts, as well as agricultural products, must be shipped hundreds of miles to the nearest markets. The current north-south routes to Denver are insufficient for our market area.

A report by an Agriculture Department task force earlier this year said the rural economy has difficulty keeping pace with national economic growth because of the small size of communities, isolation, unskilled labor, and a lack of institutional support. Improving the labor force and institutional support or activities are being addressed and improved at local and State levels. The development of highways to aid in solving the isolation problem is an activity that both urban and rural communities cannot look to the private sector to provide, but in partnership, must work with the public sector.

By enhancing the access between urban and rural areas, we believe that the expressway will create a synergy that will benefit both areas, our States, and that part of the country.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Dr. Swanson.

Mrs. Smith, as the committee develops legislation for the reauthorization of this post-Interstate surface transportation program, a major focus will be to provide greater flexibility for State and local governments to address their transportation needs in rural and urban areas.

Would the authorization of a rural program that provides the States the authority to use their apportioned funds for mass transit and highway purposes address some of the transportation needs and the concerns that you are raising about rural America?

Mrs. SMITH. I think it would be a key part of addressing those concerns. For instance, perhaps we could have the flexibility to promote this study and carry it forward. We could have the flexibility under this kind of a program to keep bus lines going in Nebraska that can't make it without a little help.

I think that this is a vital part of improving the whole rural transportation picture, and I am delighted to have your expression of interest.

Mr. MINETA. Very good.

Mr. Shuster?

Mr. SHUSTER. Thank you, Mr. Chairman.

Virginia, we certainly appreciate your leadership in this area, particularly those of us who represent rural areas. We look to you for your wisdom and guidance, and I am just sorry that you're not going to be here in the next Congress because America is going to be a loser as a result of your retirement. We are certainly going to do everything we can to help you while you are here and afterwards as well, and wish you the very best in the future.

Mrs. SMITH. I thank you very much for that, and I'm going to miss you, too.

Mr. MINETA. Mr. Bosco?

Mr. BOSCO. I have no questions, Mr. Chairman.

Mr. MINETA. Mr. Grant?

[No response.]

Mr. MINETA. Mr. Clement? Mr. Packard? Mr. Skaggs?

[No response.]

Mr. MINETA. Virginia, thank you very, very much for your presentation here, and Dr. Nitschke and Dr. Swanson, thank you very much for taking time from your own valuable schedule to have this unified front before the subcommittee. Thank you very, very much.

[Mrs. Smith's prepared statement follows:]

TESTIMONY OF CONGRESSWOMAN VIRGINIA SMITH
MARCH 15, 1990
PUBLIC WORKS AND TRANSPORTATION SURFACE TRANSPORTATION SUBCOMMITTEE

Thank you so much for allowing me to testify today on two important rural transportation initiatives.

First, I want to briefly outline a bill I introduced during the last session--HR 368, the Rural Transportation Equity Act of 1989.

This bill was designed to focus attention on the unique intercity transportation needs of rural America, which largely have been ignored by the Urban Mass Transportation Administration.

For instance, while 38 percent of the nation's population lives in rural areas, and while rural Americans tend to be of lower income and more elderly than the population in general, rural America received only 3.95 percent of total mass transit formula funds in fiscal 1989.

My bill would bring about greater equity in transit funding by increasing rural America's share of mass transportation formula funds to 6 percent. This shift in funding could be used in conjunction with another provision of the bill, which would establish a new state-administered block grant program for rural and small-urban areas, designed to raise funding for these areas by 50 percent.

In addition, the bill would establish a "Rural Mobility Working Group" within UMTA to ensure coordination of all UMTA activities with an impact on rural and specialized transportation.

Mr. Chairman, I would like to submit additional information on my bill and the state of rural transportation for the record.

Secondly, I would like to tell you about an exciting project being undertaken in Nebraska's panhandle--the Heartland Expressway.

38-253 O—91——17

This proposed 4-lane expressway would stretch from Rapid City, South Dakota, through western Nebraska to Interstate 80 at Kimball, and would provide a much-needed transportation and economic development link for this rural area.

Funds are needed at this point for a corridor study of the area. The local people are currently raising funds for this study, and the state has pledged $100,000.

Two Nebraskans have traveled to Washington today on behalf of Heartland Expressway supporters.

David Nitschke is the President of Regional West Medical Center in Scottsbluff, Nebraska. This facility is very important for rural Nebraskans who do not have access to health care in their own small communities and other outlying areas. An expressway through Scottsbluff would certainly make it easier for rural citizens to get to that important facility.

I am pleased that David has taken the time out of a busy schedule to come to Washington on behalf of this worthwhile project.

Dr. Kathi Swanson, a representative of Heartland Expressway supporters, has also traveled from Scottsbluff, Nebraska, to provide the subcommittee with testimony and additional information for the record today about this ambitious endeavor.

TESTIMONY SUBMITTED FOR THE HEARING RECORD BY
CONGRESSWOMAN VIRGINIA SMITH

MARCH 15, 1990

I greatly appreciate having the opportunity to submit additional material on HR 368 and the state of rural transportation in this country for the March 15, 1990 hearing record.

On the first day of the 101st Congress, I introduced HR 368, the Rural Transportation Equity Act of 1989. This legislation seeks to:

o Increase the share of mass transportation formula funds for rural areas from 2.93 to 6 percent.

o Establish a new state-administered block grant program for rural and small-urban areas, designed to raise funding for these areas by 50 percent.

o Change the name of the Urban Mass Transportation Administration to "Public Transportation Administration."

o Establish a "Rural Mobility Working Group" within UMTA to ensure coordination of all UMTA activities with an impact on rural and specialized transportation. The group will meet with the operators of rural transit systems on a quarterly basis to discuss training and technical assistance needs and priorities, research priorities, and coordination problems.

o Require UMTA to report to Congress annually on the levels of funding and other assistance going to rural transit operations as compared to those in urban areas.

o Require the Secretary of Transportation to urge the governor of each state to appoint a state ombudsman to coordinate public and human service transportation resources in rural areas of each state.

I have had a tough time getting this moving, and time and money are short. As the federal budget tightens, the rural-urban conflict over available funding intensifies. But the transportation problems facing rural America are great, and the goals of my bill are fair and prudent in this light.

One of my goals is modest, indeed: To increase to 6 percent rural America's share of mass transportation formula funds. Among steps necessary to achieve this would be to double the amount of DOT Section 18 funding, the only source of funding specifically designated for public transportation in non-urban areas.

Rural America continues to change. Today, the number of farms is one-third what it was in 1935, and the rural nonfarm population outnumbers the farm population by a ratio of 6 to 1.

Nevertheless, census data estimate that in 1987 at least 56,767,563 Americans lived in communities of 50,000 population or less and in the countryside covering 84 per cent of the United States' land area.

While these may be the neediest rural citizens in terms of transportation, the Department of Transportation (DOT) estimates the countryside is inhabited by about 90 million rural Americans or approximately 38 per cent of the 1987 total US population of about 243,395,996.

It should shock the nation that that this 38 per cent of the population annually receives only about 3.5 per cent of federal mass transit assistance or about $66.2 million in fiscal 1989, according to DOT.

In other words, for every federal transportation dollar invested or spent in rural areas, 28 federal dollars are invested or spent in urban areas.

The Washington, D.C., Metropolitan Area Transit Authority, serving a resident population of only about 3,000,000 persons, provides an example of federal funding bias for urban needs:

In fiscal 1989, we spent about $168 million of federal construction funds on the Washington, D.C. bus and subway transportation system alone. To finish the 103-mile system would require an additional $2.2 billion of federal funds. State and local cost-sharing from the very start 20 years ago would swell the grand total construction cost to at least $9.8 billion.

And, Washington, D.C., rail and bus passenger fares probably never will provide more than about 55 per cent of the revenue toward annual system operating costs, currently about $500 million a year. Federal, state, and local tax dollars make up this staggering, annual loss.

Yes, it is the nation's capital. Yes, one million passengers a day, including hundreds of thousands of visitors from all over the country, use the Washington Metro System's buses and subways.

The Washington Metro System provides wonderful service. I wish we had comparable--and affordable, of course--service in rural areas. I think our rural citizens deserve similar federal commitment commensurate with their needs.

But how unfair it seems to allocate for transportation to just one city of 3,000,000 population--no matter how important--in fiscal 1989 more than double the amount spent to assist the transportation needs of at least 56 million rural citizens.

My bill, HR 368, the Rural Transportation Equity Act of 1989, addresses this imbalance of funding.

I have been greatly encouraged by efforts of the Urban Mass Transportation Administration (UMTA), an agency heretofore focused on urban commuting problems, to lend a hand to rural America's transportation problems.

For example, UMTA formed a Rural Working Group within the agency to focus specifically on rural problems. As a result, rural transportation projects began receiving more discretionary funding and technical assistance than ever before.

UMTA also began providing assistance to Greyhound's new Rural Connection Program, an effort to use existing transportation systems as feeders into the Greyhound routes, and for the first time is working with the US Department of Health and Human Services to coordinate transportation services for the elderly and handicapped in rural areas.

These are welcome steps in the right direction. UMTA's policymakers deserve our thanks for their concerns and their actions on behalf of rural transportation. I hope UMTA's leadership will make even greater strides to help rural areas.

Rural America is no longer entirely dependent on agriculture, but is becoming more and more economically diversified. With this diversification, the role transportation plays in building a healthy economy in turn becomes more significant and more urgent.

While best known for providing the nation's food supply, rural America also provides manufactured products, raw materials for our steel, paper, lumber, and textile mills, and power resources in the form of oil, natural gas, coal, uranium, water, and hydro-electric generation. All of these industries require a modern transportation system.

Besides business factors necessitating a comprehensive national transportation policy that includes and addresses rural needs, one must consider the impact public transportation has on the daily lives of rural people.

Rural areas have a higher proportion of children; a lower percentage of work-age population; a higher proportion of disabled; and a larger proportion of elderly than do metropolitan areas. Studies indicate that most bus passengers fall into one of the above-mentioned categories. Ridership surveys show that the typical bus passenger is either elderly or under the age of 24 and has no alternative form of transportation.

Taxicabs are few and limited to larger towns. Passenger rail service is limited or nonexistent. The only passenger trains serving Nebraska, for example, are provided by Amtrak, with middle-of-the-night stops in Omaha, Lincoln, and three cities along the southern edge of my district. Privately owned automobiles are not affordable or practical options to millions of elderly, handicapped, sick, and poor people. Driving an automobile is called a privilege, but in many areas of rural America it is a necessity.

While intercity bus service in rural America has been declining over the past 20 years, the loss has been especially dramatic since deregulation.

The US Department of Transportation reports that since 1982, when bus service was deregulated, more than 3,000 small towns have lost service. And according to a 1986 study by the Interstate Commerce Commission, 92 percent of reductions in bus service occurred in towns with less than 10,000 people.

Of utmost concern is that for many of these small communities, bus service was their last link to intercity transportation, and for many bus riders, especially the young, the poor, and the elderly, the bus was their only means of transportation.

I would like to give you an example of what I believe is fairly typical of rural bus service. Black Hills Stage Line, runs from Omaha to Rapid City, a route 564 miles long.

Most of this route runs through the northern part of Nebraska and the congressional district I represent, and it is the only bus service available.

I worked with former DOT Secretary Dole and UMTA Administrator Al DelliBovi to commission a study of the route, along with suggested alternatives to keep the route going.

The study of the ridership on the route showed that half of the riders had no other vehicle available for the trip, and two-thirds simply would not have been able to make the trip without the bus.

The study also showed that the bus passengers' median income is significantly below the average for the study area. Over one-third had household incomes under $10,000 per year.

One in five passengers used the bus to get to work, school, or Job Corps centers, and for many more, particularly the young and elderly, the bus is the only way to visit family members who live in other parts of the state.

The bus is also the only option for overnight deliveries on the western part of the route, as well as for emergency blood shipments to area hospitals.

Now, when I think of the billions of dollars spent--not only billions for urban America, but billions spent just on the Washington Metro--it seems that as a matter of equity, we must help rural Americans like these, for whom the bus is the only means of transportation available.

The revitalization of rural America will not and cannot occur until and unless we can guarantee the mobility of its residents. I am looking forward to working with this subcommittee to implement the proposals in HR 368, as well as promote other proposals to help rural America become more mobile.

TESTIMONY FOR THE FEDERAL DEMONSTRATION PROJECT FOR THE HEARTLAND EXPRESSWAY CORRIDOR STUDY

PRESENTED TO:

The Surface Transportation Subcommittee
of the Public Works Committee
of the House of Representatives

March 15, 1990

INTRODUCED BY:

Congresswoman Virginia Smith (Nebraska)
and the
Heartland Western Dakota Expressway Group

OUTLINE OF TESTIMONY

I. Proposed Heartland/ Western Dakota Expressway Project

   A. Proposed Project
   B. Progress To Date
   C. Current Commitments

II. Importance of Access for Both Rural and Urban Centers

   A. Connecting Major Centers of Population and Industry
   B. Highways Impact Economic Development
   C. Recoupling Urban and Rural Centers to Create Synergy

III. Benefits Derived for Both Urban and Rural Areas

   A. Nebraska Panhandle
   B. Western South Dakota
   C. Synergy of Benefits for Both

IV. Support for Project

   A. Local
   B. State
   C. Federal

V. References

TESTIMONY

I. Proposed Heartland/Western Dakota Expressway Project

A. Proposed Project

In order to bring rural development opportunities to Western Nebraska and to aid in the growth in western South Dakota, we are requesting $1 million dollars in federal demonstration funds for a corridor study to examine the feasibility of a proposed four lane expressway (not interstate) route from Denver Colorado to Rapid City South Dakota through the Panhandle of Nebraska. This proposed route would connect north/south three major interstates and cities in the West -- Denver via I-25 to I-80 at Cheyenne WY to Kimball, Nebraska, to I-90 in Rapid City, South Dakota.

B. Progress to Date

Governor Kay Orr and the state of Nebraska have already committed to build the first link of this expressway with state funds -- the Highway 71 section between Kimball and Scottsbluff.

C. Current Commitments

In keeping with our responsibility to plan for the future, the 22 communities along this route, the states of Nebraska and South Dakota have pledged over $220,000 for the match of funding for the federal demonstration project for the corridor study.

To date, we are bringing financial commitments of almost a quarter of a million dollars from state and local sources to this request for federal funding of the corridor study.

II. Importance of Access for Both Rural and Urban Centers

A. Connecting Major Centers of Population and Industry

Research of the impact of interstate highways on income and sales expansion has led to the conclusion that if sufficient traffic flow and economic development are to result, the points that the highway are connecting should be clearly identified. It is unrealistic to assume an expressway will carry requisite traffic flows if there are not destination points of interest to travelers or shippers (Ambrose and Pol 1988).

By examining the population density map of the western area, one can see the highest population concentrations. Denver is the major trade center for this region and most commerce flows in and out of Denver. If you overlay the current interstate system, you can see that the most dense areas in Nebraska and South Dakota are not connected to Denver by a suitable four lane route.

This Expressway would connect the four most dense population areas -- Denver to Cheyenne to Scottsbluff, NE, to Rapid City, SD. This Expressway would connect over three million people and provide access to over 20 million visitors to tourism markets.

Proposed Four Lane Highway

Heartland/ Western Dakota Expressway

Nebraska Expressway Planned

Corridor Study Being Requested

B. Highways Impact Economic Development

The connection between highway improvements and economic development is both obvious and illusive. Conventional wisdom holds that ample, well maintained highways, streets, and roads are important to an area's development potential because they provide access to resources, goods and markets. In any form of economic activity, accessibility is a critical need (Forkenbrock and Plazak 1986).

C. Recoupling Urban and Rural Centers to Create Synergy

In order for rural areas to participate in the growth in the urban centers, a recoupling between the urban and rural centers has to occur. One way for this recoupling to occur is to develop an infrastructure providing access to the urban markets from the rural areas.

Rural areas have the advantages that today's manufacturers are looking for -- efficient labor, high quality of life, cheap energy, good educational systems and health care. Both South Dakota and Nebraska are ranked in the top three of Grant Thornton's study of favorable manufacturing climates. However, for the rural areas to participate in the growth that the urban regional centers have been experiencing, there has to be a modern highway system for the movement of people and goods into major markets.

We have passed local taxes to build and maintain our own city streets and highways, but beyond our borders we must rely on the wisdom of Congress and the Federal Highway Administration officials to accommodate the growth we live with every day. Our local communities and states are willing to share in the cost of these endeavors, but highway construction is still an area that private enterprise cannot take over and requires the assistance of the Federal Government.

III. Benefits Derived for Both Urban and Rural Areas

A. Nebraska Panhandle

Research has shown that highways lead to economic stimulus in areas that have an infrastructure capable of handling growth. Counties in Iowa that had connections to the Interstate experienced a positive employment growth of 15 percent while those counties non contiguous to the Interstate lost 0.6 percent (Barton-Aschman 1989). In Pennsylvania, it was found during the 1970 to 1980 period, non-urban counties that had interstate exchanges experienced an employment growth of 15 percent, compared with 9 percent for the state as a whole (Eyerly and Downing 1987). We believe population stabilization and growth can occur in the Panhandle as a result of the four-lane expressway through continuing efforts at economic development.

The Black Hills area supporters view the proposed four-lane expressway beginning at Kimball as a natural draw for tourists into the Black Hills. Tourists would be encouraged to "Experience the Oregon Trail" with the rich history of the old west available in the Panhandle of Nebraska. The area is rich in national parks and recreation areas and in entrepreneurial endeavors. For example, one entrepreneur in Westrn Nebraska has developed a Conestoga Wagon Trail that recreates the experience of the Oregon Trail on a several day outing. Improvements in Scottsbluff National Monument, Chimney Rock visitor center, Agate Fossil Beds and Fort Robinson are underway at local, state and federal levels.

The proposed north/south expressway would have strategic importance for both Nebraska and South Dakota. Over 200 Minuteman and Peacekeeper missiles are located in the Wyoming/Nebraska/Colorado area. The Expressway Group believes improved four-lane access to this area would aid the missile squadron's mobility. In addition, Francis E. Warren AFB (Cheyenne WY) and Ellsworth AFB (Rapid City SD) would be strategically linked by four-lane access.

We believe rural bus service to western Nebraska and South Dakota should improve with the completion of a four-lane expressway. Currently, the large bus lines only travel on four-lane access

for their major routes and tend to by-pass rural America.

B. Western South Dakota

The Expressway has immeasurable importance to the economy of western South Dakota. The vastness of the American plains demands that good transportation linkages exist to provide reasonable access for people and products in and out of the area.

The nation's Shrine of Democracy, Mount Rushmore, is located in the Black Hills of Western South Dakota. This awe-inspiring national memorial hosts over 2 million visitors per year. Yet, as important as it is, the American Automobile Association can't provide a trip map showing a route to reach Mt. Rushmore from Denver which is our nearest major metropolitan market.

While some national writers deride the status of the West, the fact remains that the economy of Rapid City is outperforming the nation's economy in several respects. Our manufacturing employment and our overall employment have been growing faster than the rest of the nation. Pennington County, at the north end of this corridor, had a population growth rate of 16.4% in the 1980's.

This growth is putting strains on our infrastructure and it will continue. People who travel one segment of this proposed highway

display bumper stickers reading "I survived Highway 79". Current traffic counts on this two-lane section of road south of Rapid City, which would become a part of the Expressway, are almost equal to the traffic counts on Interstate 90 in South Dakota.

We have reasonable access to the east and west, but north/south transportation is at a serious disadvantage. Manufactured products as well as agricultural products must be shipped hundreds of miles to the nearest markets, and the current routes to Denver are insufficient for our market needs. As we improve our trade relations with Canada, our entire nation's north/south connections must be looked at closely.

C. Synergy of Benefits for Both Areas

Both urban and rural areas can participate in the growth and development activities by working together to provide access to major markets. For example, the Panhandle of Nebraska was not chosen as the distribution warehouse site for a major national company because of no four lane access to Denver. Rapid City is being considered by a European company as a site for a major manufacturing plant. One of the concerns of the company is access between Rapid City and Denver for raw products and finished goods.

A report by an Agriculture Department Task force earlier this year said the rural economy has difficulty keeping pace with national economic growth because of the small size of communities, isolation, unskilled labor and a lack of institutional support. Efforts at improving the labor force and institutional support are activities that are being addressed and improved at the local and state levels. The development of highways, to aid in solving the isolation problem, is an activity that both urban and rural communities cannot look to the private sector to provide, but must look to public funds. By enhancing the access between the rural and urban areas, we believe that the expressway will create a synergy that will benefit the areas, their states and our country.

IV. Support for Project

A. Local

Commitment of funds of over $100,000 from the communities potentially affected

Letters of Support Follows

PERFORMANCE
CRITERION
New standards in information and technology

January 17, 1990

Mr. G. C. Strobel
Director - State Engineer
Nebraska Department of Roads
P. O. Box 94759
Lincoln, NE 68509

Dear Mr. Strobel:

The Heartland Expressway group has the commitment of Congresswoman Virginia Smith in obtaining a majority of federal funds to conduct a corridor study for the proposed Heartland Expressway. Since a match of state funds will be needed to obtain the federal funds, we are pledging to raise locally any additional funds the state needs over a 10% match for this project.

To date, the Heartland Expressway group has raised $100,000 in the communities of Scottsbluff/Gering, Alliance, Chadron and Kimball. In addition, seventeen Black Hills communities and the State of South Dakota have raised over $20,000.

We are committed to this project. We ask the state to show similar commitment so that the project can go forward.

Sincerely,

HEARTLAND EXPRESSWAY

Scottsbluff, NE 69361

Dear Steve,

On Wednesday, Oct. 5, the Retail Merchants Association of Kimball, NE passed a resolution to support the efforts of the four lane access to the interstate for Scottsbluff.

The Association definitely feels we need to support efforts for this access to follow Highway 71.

This highway project could increase economic development and the tourism industry for the whole panhandle.

The Retail Merchants Association is a group of business leaders who join together to solve problems and help promote the business sector of Kimball.

The Association would like to be a part of the planning and processing of this project in order to provide the best possible interest for the community.

Sincerely Yours,

Scott Haun, Chairman
Retail Merchants Assoc.

October 14, 1988

Governor Kay A. Orr
Office of the Governor
State Capitol Building
Lincoln, NE 68509

Dear Governor Orr:

As you are well aware, we in western Nebraska are dependent upon a well-developed highway system to insure our economic future. The purpose of this letter is to convey the support of this organization for the concept and efforts of the Expressway 71 Committee in our area to realize four-lane access to I-80 as a first step toward a future north-south border to border four-lane corridor.

We further support the approval of funding for the project only if funds are specifically earmarked for the development of four-lane expressways as per the proposal of this group.

I might add that the support base for Twin Cities Development Association, Inc. includes the Cities of Scottsbluff and Gering, Scotts Bluff County and some 200 private businesses throughout the county.

Thank you for your attention.

Sincerely,

Ron Diffendaffer
President

RESOLUTION

WHEREAS, a coalition of community leaders from Ft. Morgan and Brush, Colorado, the Nebraska cities of Kimball, Gering, Scottsbluff, Alliance and Chadron, and the South Dakota cities of Hot Springs and Rapid City, has been formed in order to support the construction of a four-lane expressway connecting Ft. Morgan, Colorado, to Rapid City, South Dakota; and

WHEREAS, this coalition is supporting a study currently being conducted by the CLARUS Corporation to determine the economic impact of the proposed expressway; and

WHEREAS, the coalition will present the information derived from the study to the Congressional representatives of Colorado, Nebraska and South Dakota at a joint meeting to be held in Washington, D.C., prior to the end of 1989, to solicit their support for such expressway construction as a Federal Demonstration Project with necessary funding commitments for construction to be completed by the year 2000; and

WHEREAS, the coalition is also committed to future development of plans to complete a study of the economic impact of an extension of the planned expressway from Saskatchewan, Canada to Rapid City, South Dakota, thereby linking Canada to Mexico via a North-South four-lane highway system through the heartland of the United States.

NOW THEREFORE, Mayors of all of the communities included in the coalition, do hereby place their signatures on this Proclamation as an indication of their support for the proposed expressway, and together ask that all of the citizens of the area adjacent to the highway join them in seeking to bring economic stabilization and growth to our communities.

Members of the Surface Transportation
Sub-committee of the House
Washington, D. C.
20510

Dear Member:

Rapid City is a progressive City and one that is growing significantly. As we look to the future, we must address those elements around us which will be problems if they are not properly addressed.

One of those elements is adequate transportation. We have passed taxes in our community to provide for our internal street and highway needs. But beyond our borders, we have transportation issues which must be addressed at the Federal level of government. I am, therefore, asking your support and the approval of the Public Works committee for funding to do a Corridor Study for a four lane highway which would link Rapid City to Denver, Colorado. Significant traffic volumes exist in that corridor today and the future will certainly see increases.

Not only must we be concerned for economic reasons but for reasons of public health and safety. I'm sad to report that people who travel U. S. Highway 79 south of Rapid City are in great peril. Many of them display bumper stickers which say, "I survived Highway 79".

A thorough study of this corridor is necessary to learn whether or not a four lane highway is needed, as I believe it is, but it will also identify the cost, so we may plan for our future needs.

I encourage your support and thank you for your consideration.

Sincerely,

Keith Carlyle,
Mayor

Members of the Surface Transportation
Sub-Committee of the House
Washington, D. C.
20510

Dear Member:

I'm writing to show the support of the Rapid City Area Chamber of Commerce for the Corridor Study of a highway route linking Rapid City, S. D. to Denver, Colorado.

Rapid City is growing very solidly in manufacturing, service trades, retail trade, wholesale and distribution, and in natural resource development. The City also hosts the largest operational base in the Strategic Air Command, Ellsworth Air Force Base. Over 7,000 military people are stationed at Ellsworth.

I have enclosed charts showing Rapid City's employment and manufacturing growth exceeding the current growth rate of the rest of the United States for a number of years. This growth is putting demands on our transportation system that must be addressed. Because Denver, Colorado is the nearest major metropolitan city, but the linkage between our two cities is very poor.

I encourage your support for this study to learn if better transportation systems in the heartland of America will further improve our economy as we move ahead in our nation's development.

Sincerely,

Rapid City Area Chamber of Commerce

John D. Schmit

Members of the Surface Transportation
Sub-Committee of the House
Washington, D. C.
20510

Dear Member,

I am writing to ask for your support for funding a study of the economic impact and the cost for developing a four lane highway connecting Rapid City, S. D. to Denver, Colorado.

Rapid City has become a significant regional center for trade and health care in a five state region. We have also seen a significant increase in manufacturing employment, greatly exceeding the rate of growth in the rest of the United States.

While many parts of the mid-west have suffered economically during the last 10 years, Rapid City has shown significant growth. But as we grow, it is becoming increasingly evident that we lack the proper transportation links which we will need in the future to maintain that growth. We are well connected to the east and west, but very poorly connected to Denver which is the nearest major population center.

I encourage you to support the Corridor Study for this link. Where areas of the country are growing significantly, we need to make sure those communities, such as Rapid City, have adequate transportation.

Sincerely,

Kirk Dean

March 9, 1990

Members of the Surface Transportation
Subcommittee of The House
Washington, D.C. 20510

Dear Member:

The purpose of this letter is to seek your support for funding a Corridor Study that would address both expected costs and benefits of a four-lane highway that would link Rapid City, South Dakota, to Denver, Colorado.

The Black Hills Council of Local Governments represents local units of government in the seven westernmost counties of South Dakota and has been involved in economic research and development activities since 1972. Over the course of some 19 years, many formal studies and other examinations of constraints to area economic development have been performed. One fact has always appeared as a dominant constraint: deficient highway linkages to the large primary markets lying to the south and west of our regional trade center located in Rapid City, South Dakota.

Given the geographical placement of our area with regard to its lack of proximity to large population centers, surface transportation linkages are crucial to keeping existing markets and penetrating new ones. Agriculture, forest products, general industrial/commercial goods and tourism all are dependent upon establishing and maintaining road transportation systems that adequately serve the needs of modern motor transportation.

Our Black Hills Council board members strongly encourage you to support the proposed Corridor Study that will address this issue of vital importance to our area. Thank you for your consideration.

Sincerely,

Van A. Lindquist
Executive Director

OFFICE OF
THE COUNTY
COMMISSIONERS

Box Butte County **Alliance, Nebraska**

March 12,1990

Dear Legislators:

We are pleased to be able to express our feelings concerning the proposed Heartland Expressway through western Nebraska and South Dakota

Agriculture and the many services that go along with it are very important to our area. If the proposed expressway were built, it would not only benefit the cities and towns, but it would be a tremendous boost for the farmer. The economic base of the entire community, which has suffered in recent years, would be strengthened by new industry and the possible increased flow of tourism through the state.

A major concern facing our area today, is the possibility of the Chicago and Northwestern Railroad, which runs across northern Nebraska, of going out of business. To the farmer this means one less channel of trade for their commodities. Burlington Northern runs through central Nebraska, but their main freight is coal. This leaves Union Pacific, which runs through southern Nebraska as the best option for transporting area commodities. The construction of the expressway would be a great asset and would be an economically sound solution to the problem of transportation.

Yes, we do need the expressway. Not only for the farmer,but for each and every community involved. Rural America is hurting and the proposed expressway would be a great boost for our economy.

Sincerely,

Don Hansen

March 9, 1990

Box Butte Development Corporation
Alliance, Ne. 69301

Dear BBDC,

Add our names to those in support of the "heartland expressway" proposal. Ginny and I have watched, with eager anticipation, your efforts to get federal approval of a 4 lane expressway linking South Dakota and Colorado, via western Nebraska.

We think it vital to not just our area, but to the area of Western South Dakota as well. As a former South Dakotan, with plenty of family still in the Kadoka to Rapid City area, I am well aware that they, like western Nebraskans feel a dependence upon east/west travel patterns, and more than a bit isolated from the north/south neighbors due to an inadequate transportation system.

I think that the key issues are: safety, economic development, and service. There is little doubt a 4 lane system provides for safer travel, and our weather conditions often make our present system unsafe. Economic development is never easy, but my experiences as a veterinarian working closely with folks in agriculture indicate that transportation of grain and livestock, equipment and supplies, even tourists and visitors, is dependent upon good transportation. Railroads and airlines have their limitations in providing us service. Our highway system is greatly dependent upon the east/west interstate. A new north/south route in the west, similar to the interstate along the Iowa/Nebraska border would greatly inhance our efforts to further stimulate our area economically.

Furthermore, it is more apparent to all of us that tourism and recreation have good potential for stimulating our Nebraska economy, as well as providing a quality of life for our neighbors and out of state friends. An improved highway system could go a long way to aiding us in that effort.

Good luck in your efforts.

Sincerely,

Bob & Ginny Stout

Washington, D.C. 20510

Dear Congresswoman Smith:

The Heartland Expressway that is proposed through Western Nebraska has prompted extreme support and interest among the citizens and communities of the Panhandle. It would provide a valuable north-south link through Nebraska, boost the rural economy, increase potential tourism, and entice industry to this part of the state.

On behalf of Occidental Nebraska of Alliance, we are writing in support of this proposal and ask that you give it your utmost consideration in light of what it will do for the fine state of Nebraska.

Sincerely,

OCCIDENTAL NEBRASKA SAVINGS BANK, F.S.B.

Senator J. James Exon
U.S. Senate
Washington, D.C.

Dear Senator Exon:

As we enter the decade of the 1990's, the challenges confronting Rural America continue to multiply. To meet these challenges requires the dedication and courage of the people who live and work in these areas. As a proud native of the Nebraska Panhandle, I can attest to the hard work and innovation being shown by the people of this area.

Specifically, I am writing to you to encourage your help and committment in support of the proposed Heartland Expressway. The creation of the Heartland Expressway would enhance the transporation structure of the area as well as stimulate the regional economy, promote tourism, and open the door for further opportunities, which have not been available in the past.

The transportation structure in the Panhandle has historically been a major roadblock inthe economic development of the area. With limited air transportation and the threat of one of the major rail lines discontinuing its service, highway transporation becomes that much more critical to our overall infrastructure. In order to be economically competitive we need a cost effective alternative for transport of our products and professional services, to name just a few.

Again, I encourage your support of the Heartland Expressway. It would be your way of helping out the people in the Nebraska Panhandle, who are so diligently working to help themselves.

Sincerely,

Scott R. Prusia
Branch Manager

To whom it may concern:

My husband and I read the article about the proposed expressway, and after some discussion, we agreed that it would be a definite benefit to Alliance and the other communities.

If the expressway were constructed, it would focus more attention upon the panhandle, thus bringing in more business and companies. While it was being constructed, it would provide jobs and stimulate the job market. Also, since many residents (college students also) travel to Chadron and Scottsbluff regularly, a better road system would be beneficial to all.

For all of the reasons above and more, my husband and I are supporting the building of this expressway.

Sincerely yours,

Pat and Rhonda Meng

Pat and Rhonda Meng

March 12, 1990

Dear Legislators:

We are pleased to be able to express our feelings concerning the proposed Heartland Expressway through western Nebraska and South Dakota

Agriculture and the many services that go along with it are very important to our area. If the proposed expressway were built, it would not only benefit the cities and towns, but it would be a tremendous boost for the farmer. The economic base of the entire community, which has suffered in recent years, would be strengthened by new industry and the possible increased flow of tourism through the state.

A major concern facing our area today, is the possibility of the Chicago and Northwestern Railroad, which runs across northern Nebraska, of going out of business. To the farmer this means one less channel of trade for their commodities. Burlington Northern runs through central Nebraska, but their main freight is coal. This leaves Union Pacific, which runs through southern Nebraska as the best option for transporting area commodities. The construction of the expressway would be a great asset and would be an economically sound solution to the problem of transportation.

Yes, we do need the expressway. Not only for the farmer, but for each and every community involved. Rural America is hurting and the proposed expressway would be a great boost for our economy.

Sincerely,

Sherry Hitchcock

Commitment of funds of $100,000 from the state of Nebraska

Letters of Support Follows

STATE OF NEBRASKA

DEPARTMENT OF ROADS

KAY A. ORR
GOVERNOR

G. C. STROBEL
DIRECTOR-STATE ENGINEER

January 24, 1990

Mr. Steve Tando
Project Coordinator
Heartland Expressway
115 Railway Plaza
Scottsbluff, NE 69361

Dear Mr. Tando:

The Nebraska Department of Roads is responsible for developing a specific and long-range state highway system plan. The Department is also responsible for annually reviewing the state highway system's needs and shall assign priorities for such needs.

As directed by LB 632 in 1987 and the Nebraska Legislature, a system of expressway priorities was developed. In Section 23 the bill stated, "The Legislature finds and declares that the highways of the state are of the utmost importance to future development within the state and . . . the development of a system of expressways, which shall include, but not be limited to, a north-south expressway." As a result of that mandate by the Legislature, U.S. 81 was chosen as the north-south expressway in Nebraska.

In keeping with its responsibility to plan for the future, the Department of Roads supports the attempt to secure federal demonstration funds as the primary source of funding, matched with a maximum of 10% state funds up to $100,000.00, for a corridor study for the Heartland Expressway. The Department will aid in any way needed to obtain the federal funds.

Sincerely,

G. C. Strobel
Director-State Engineer

Mr. David Nitschke
Heartland Expressway Group
115 Railway Plaza, Suite A-105
Scottsbluff, Nebraska 69361

Dear David:

I applaud your efforts to bring valuable rural development opportunities to western Nebraska. Your organized presentation of the need for development in the Panhandle, along with your proposed solution, is commendable.

I have always strongly supported efforts to improve the inadequate transportation network in rural Nebraska, and you can be sure that I will do all I can to help you secure a majority of federal funding for a corridor study of an expressway through the Panhandle.

The State Department of Roads, at the direction of Governor Kay Orr, has already recognized the need for increased mobility in the Panhandle by deciding to upgrade Highway 71 between Kimball and Scottsbluff to four lanes. The proposed corridor study should greatly enhance efforts to improve infrastructure needs in western Nebraska.

With best wishes, I am

Sincerely,

VIRGINIA SMITH

Mr. Steve Tando
Project Coordinator
Heartland Expressway
115 Railway Plaza Suite A-105
Scottsbluff, NE 69361

Dear Mr. Tando:

I am pleased to support efforts to improve transportation in Western Nebraska through a corridor study for a proposed "Heartland Expressway."

Toward that end, I will work closely with Nebraska efforts to secure authorization for federal assistance for the corridor study. I am advised that the Nebraska Department of Roads, as the state's central highway planning agency, has said it will commit $100,000 in state funds to match federal funds. Furthermore, I am advised that local efforts have secured additional matching funds. Of course, this type of support from both state and local levels is very helpful to our efforts in Washington.

The rural regions of our nation must have access to national transportation arteries that meet the transportation needs of the 21st century. That is why a corridor study for a Heartland Expressway is important.

The federal highway program comes up for renewal in 1991 at a time when our national interstate highway system is finally being completed. I am proud to say Nebraska was the first state to complete its portion when I served as Governor. The new Highway Bill will give us an opportunity to address Nebraska's future transportation needs.

With best wishes.

Sincerely,

Jim Exon

To Wes Shelton

From John Devereaux
Office of Congressman Tim Johnson
202/225-2801

February 26, 1990

This is a joint statement of support for the Heartland/Western Dakota Expressway from both Congressman Tim Johnson and Senator Tom Daschle.

Please feel free to use it in your news release or in any other way that would be helpful to you. If you have questions or need more information, don't hesitate to let us know.

"The proposal for a Heartland/Western Dakota Expressway, running between Rapid City and Interstate 80 in Nebraska, has the potential to foster accelerated economic growth for all of western South Dakota. It would present opportunities for increased tourism and community development.

"In a time of tight federal and state budgets, planning any new initiative is always a challenge, but this expressway is a goal worth working to achieve. We look forward to cooperating with other members of the South Dakota and Nebraska congressional delegations -- together with leaders in communities and counties along the projected expressway route -- in this endeavor."

STATEMENT OF

UNITED STATES SENATOR LARRY PRESSLER

FEBRUARY 27, 1990

I commend the people of South Dakota and Nebraska who are working together on this innovative proposal. An accessible infrastructure is vital to economic growth and the revitalization of rural areas. That's why it's appropriate that the Heartland/Western Expressway is billed as "a road to the future."

To be successful, this project will need the full support of affected communities, the Congressional delegations and the cooperation of the Nebraska and South Dakota Departments of Transportation.

I will continue to work closely with my Senate and House colleagues to explore all possibilities of moving this project forward.

The potential community development that could result from the construction of a Heartland/Western Expressway is encouraging. Again, I congratulate the dedicated people of western Nebraska and South Dakota who are developing this project.

Mr. MINETA. At this time I would like to call on our colleague, Congressman Rick Boucher.

Congressman, have you submitted a statement?

Mr. BOUCHER. I have, Mr. Chairman, and I would ask that it be made a part of the record.

Mr. MINETA. Without objection, it will be. Please introduce your colleagues.

TESTIMONY OF HON. RICK BOUCHER, A REPRESENTATIVE FROM VIRGINIA, ACCOMPANIED BY STEPHEN A. MUSSELWHITE, COMMONWEALTH TRANSPORTATION BOARD, ROANOKE, VA; ANTOINE G. HOBEIKA, DIRECTOR, CENTER FOR TRANSPORTATION RESEARCH, VIRGINIA POLYTECHNIC INSTITUTE, BLACKSBURG, VA; AND RICHARD W. ROGERS, ROANOKE COUNTY BOARD OF SUPERVISORS, ROANOKE, VA

Mr. BOUCHER. Thank you very much, Mr. Chairman. I would like to introduce to the subcommittee Mr. Steve Musselwhite, who is on my left, who is with the Virginia Department of Highways and Transportation; Mr. Tony Hobeika, who is on my right, a professor at Virginia Tech in Blacksburg, Virginia; and on my far right, Mr. Dick Rogers, who is the Chairman of the Roanoke County Board of Supervisors.

Mr. Chairman, having had my prepared statement accepted for the record, I will take just a few minutes to summarize the project that we are advocating this morning.

I would like to start by expressing my appreciation to you and the members of the subcommittee for your hospitality today in giving us this opportunity to describe a vital highway link in the 9th Congressional District of southwestern Virginia. This link would connect Virginia Polytechnic Institute and State University in Blacksburg—Virginia's largest university, having a population of about 25,000 students—with Interstate 81, and by doing so provide a more direct link to the Roanoke Valley, which is the largest urban center in the western part of Virginia.

During your last week of testimony you heard about the importance of transportation as a spur for economic development, to provide productivity gains, to enhance international competitiveness, and to meet the mobility needs of the United States. You have also heard about some problems, problems in transportation that are associated with highway congestion, with air pollution, and with accidents. One mention was also made of a possible solution for some of those problems, and that mention was of the Intelligent Vehicle Highway Systems, also known as "smart cars" and "smart highways," and for purposes of this presentation today what we will refer to as the "smart roads concept."

That is intended to make traffic safer, more efficient, and more environmentally benign. The technologies that are a part of the smart roads system arise from advances in traffic management, driver information, and vehicle control technologies. They are made possible by computers, electronics, and advances in telecommunications technology.

When Secretary Skinner testified before this subcommittee earlier this month he noted this advance in his statement, and he sug-

gested that budget increases be made available for research and development in these technologies for the purposes of facilitating the movement of both people and goods. The advancement of transportation technology into the 21st century was a major theme of Secretary Skinner's presentation, and it's a very important theme, particularly insofar as it relates to the smart roads concept.

I would note that in Japan and Europe, more than $2 billion have already been spent in developing smart highway technology. In the United States, our automobile industry has already begun to develop smart vehicles, but we really haven't done very much as a Nation in order to develop smart highways, and that goes hand-in-hand with smart vehicles.

The lead that is enjoyed today in Japan and in Europe is not insurmountable, but it is clearly time that we get started. This authorization measure presently pending before the subcommittee would be a very good beginning point.

Today I am pleased to talk about a unique opportunity that is presented for smart highways in a six-mile highway link in southwest Virginia between Virginia Tech and Interstate 81 in Montgomery County. To my knowledge, this would be the first intelligent highway to be constructed from the ground up in the entire United States. The highway link would connect Virginia Tech with the Roanoke Valley and its industries and emerging high tech companies.

The university itself has an outstanding reputation for its research capabilities. Its total research expenditures last year were on the order of $104 million. It is annually ranked in the top 20 universities nationwide in the attraction of private funds for research activities. Last year Virginia Tech awarded more than 1,000 master's degrees and more than 300 doctorate degrees. In its latest survey, U.S. News & World Report found that Virginia Tech's School of Graduate Engineering ranks 22nd out of some 200 engineering schools nationwide.

The point of my reciting these figures is simply to point out that Virginia Tech would be an excellent locus for conducting the kind of research and development of smart highway technologies that we are proposing today.

The purpose of the highway link itself, which we refer to as the University Connection, is to bring these two communities closer together and to relieve the current traffic congestion that exists on the current connection between the University and Interstate 81 in Montgomery County. Because of the economic development benefits that would flow and the obvious relief that we would receive from traffic congestion, the measure is broadly supported by the local governments that are involved.

The Virginia Department of Transportation, the university, and the local governments have already established two committees—one is for conceptual purposes and the other is technical in nature—to help develop the smart highways concept. In that regard, we are holding a major conference at Virginia Tech in Blacksburg in April on the smart highways concept that will involve the university, the Government, and the private sector. We have received a large number of expressions from private sector

companies to participate in the development of this exciting project.

A four-lane divided highways is proposed for this link with one additional lane, a fifth lane, to be used as a test bed for the most advanced of the smart highway technologies. These would be the longer-term technologies that relate to automatic control of vehicles, allowing drivers to simply punch in coordinates on a keypad, and then have the car do the work in delivering that driver to his ultimate destination. Those are the longer-term aspects of the technology that we would not expect to see developed until after the year 2000.

The regular four lanes of traffic would be used for testing and development of the nearer-term technologies that would involve driver information and safety. Therefore, we would anticipate all five lanes being involved in the demonstration.

We ask that in the authorization of the Surface Transportation Act, an amount of $95 million be made available for this demonstration project. We estimate the total cost of the highway project to be about $117 million, exclusive of the smart highway concept. So when that amount is factored in—and I will have to say in candor to the subcommittee that I don't have a reliable estimate on how much that will cost today—the cost of the total project, including roadbuilding and the smart highway, will be far higher. We're asking for $95 million in Federal funds for this effort. The balance of the monies will be derived from State and local government sources.

I would suggest that the location of this road is ideal for testing the application of smart road technologies in rural areas, and obviously, a rural test is going to be necessary if the technology is to be developed nationwide. We have rolling mountain terrain. We have four seasons of climate, so testing could occur on varying roads during varying weather conditions.

I would like to cite just two examples of how the nearer-term technologies could be of interest. These are "information to the driver" kinds of technologies that would promote safety. One obvious example would be a driver who is preparing to move into the passing lane but has a car in his blind spot, which he perhaps doesn't see. A warning light, and perhaps an audio signal, on his dashboard would indicate to him that that car is in fact in the passing lane in his blind spot and would allow an accident to be avoided.

Another use of the technology would involve drivers who have traveled long distances and are weary, and perhaps doze off. When they leave the traveled portion of the road another audio signal would sound, giving them clear notice that a problem was present and that they should recover. Many other examples would come to mind. Those nearer-term information technologies would be tested on the four regular lanes of travel.

It is estimated that about half of all the fatal accidents in the United States today occur on straight stretches of road, and typically, these are the driver's fault. Many of those could be avoided through the implementation of this kind of information and warning system.

The more advanced long-term technology, as I indicated, would involve the automatic control of vehicles. That would be tested in the special smart lane that would be added, apart from the four lanes of regular travel, and obviously would involve a substantially higher cost. The Federal Highway Administration has endorsed Federal spending for this kind of research, indicating that it would provide higher vehicle carrying capacity for a given amount of right-of-way and increase future levels of highway service for both intercity and urban highway travel. That extra lane would be used to conduct full-scale engineering tests to determine the design and fabrication requirements of automatic control of vehicles in a real world operational setting.

I would also suggest to the subcommittee that the construction costs of the test bed would be far less expensive in a rural area than in a city, and of course, the environmental impacts in terms of relocating businesses and residences would be less expensive if performed in a rural area, as well.

Although the preliminary studies for site location have been completed for this project, the project has just recently been added by the Virginia Department of Highways and Transportation to its six-year plan for highway construction. We therefore anticipate that project construction will start during the mid-1990s. We know that it takes five to six years to build a highway in a rural area, probably more like eight to nine in an urban area, and if we want to begin the tests for these technologies during the 1990s, that would mean that this legislation is the appropriate time to authorize a demonstration project. We would very much appreciate this subcommittee's favorable consideration of that request.

Mr. Chairman, that concludes our presentation. I thank the subcommittee for its receptiveness and I will be happy to join with others at the table in answering the subcommittee's questions.

Mr. MINETA. Thank you very much, Mr. Congressman. Your request for a demonstration of this developing IVHS technology on a six-mile roadway connecting VPI with Interstate 81 is very creative and thought-provoking. Is this to help the recruiting program at VPI? [Laughter.]

Mr. BOUCHER. That would be one collateral benefit, Mr. Chairman.

Mr. MINETA. How much of this will go to creating a "smart drive"? [Laughter.]

Mr. BOUCHER. We hope to institute a program on that at Virginia Tech in the near future.

Mr. MINETA. I noticed another thing when you said, "In another case, a driver is tired after driving for hours on the road. The car starts drifting off the lane, but a sensor in the vehicle immediately identifies what is happening and alerts the driver, who steers the car back on course." We have that right now. It's called potholes. [Laughter.]

Congressman Boucher, let me ask first, I am wondering how the actual smart car/smart highway technology proposed for testing in southwest Virginia differs from the smart highways now being tested on the Santa Monica Freeway and the 25 smart cars that are operating with the Federal Highway Administration funding in the greater Los Angeles area?

Mr. BOUCHER. Mr. Chairman, I will ask Mr. Hobeika to answer that for you.

Mr. MINETA. Professor, if you would go ahead?

Mr. HOBEIKA. Mr. Chairman, it is not different. It is basically complimentary. The testing going on in the Los Angeles area is mainly to divert traffic from one area to another. It is basically for unclogging urban highways.

The emphasis here in this demonstration, as Congressman Boucher said, is on safety information and on testing automated highways. These would be complimentary. These are all within the scope of the Federal Highway Administration's draft report on that, and we are taking it for testing it for intercity travel and rural travel as well as the demonstrations taking place in urban areas.

Mr. MINETA. Also, of the $95 million that is being requested in Federal funding, how much of it is associated with construction of the four regular highway lanes versus the Intelligent Vehicle Highway System technology which you described as being placed in the fifth lane?

Mr. BOUCHER. Mr. Chairman, the construction costs for the entire highway link, absent any smart vehicle application, is about $117 million. At the moment we do not have a detailed estimate of what the costs of the smart road technologies would be. We are working to develop that, and hopefully by the time this subcommittee proceeds to markup, we can supply you with a more detailed estimate than we have available today.

Mr. MINETA. Very well. Thank you very much, Congressman.

Mr. Shuster?

Mr. SHUSTER. Thank you.

We certainly appreciate your innovative suggestion here, Congressman.

I can understand how a highway can be equipped. How would you propose that the automobiles be equipped? How do you control that, and what is the cost of that going to be?

Mr. HOBEIKA. The industry is already working on that. G.M., Ford, Chrysler, and many others are working on equipping their cars with that. Some of this technology is already here in the cars.

So I think there is a need, as well as an absence of constructing highways that would be able to communicate with these cars.

Mr. SHUSTER. I understand that the automobile companies are working on that. In fact, we had testimony to that effect just yesterday. But my question is, how would you get that technology? How would you identify the cars, and who would pay for that being put in the cars?

Mr. HOBEIKA. This is part of our collaboration with the industry. As Congressman Boucher said, we are working on making industry relationships as well as local and State government relationships in getting this worked out.

Mr. SHUSTER. Okay. Thank you very much.

Mr. BOUCHER. Mr. Shuster, if I might complement that answer by saying that our proposal really is to provide Federal funds for putting the technology into the highway. The technology that would be borne on the automobile would be financed in large part

by the private sector. We're really not asking for Federal money for that.

Mr. MINETA. Mr. Bosco?

Mr. BOSCO. Thank you, Mr. Chairman.

And Rick, thank you and the panel for a very foresightful idea and presentation.

Following up on Mr. Shuster's question, our household has experimented a little bit with a small offshoot of smart automobiles. My wife, who is a judge, has agreed for one year to have a device on her car—not mine—that will prevent anyone who has had any drinks from driving. You literally have to breathe into that device to start the car. It actually works very well. Obviously, not everyone would want it. [Laughter.]

As I say, I don't have it on my car—but I can see, if we were to be sitting here five years from now, the ideas that you are just forwarding to the Congress will probably have taken this and many others and become household equipment and household terms.

I admire you for coming to the committee with, really, the first presentation by a Member of Congress that attempts to incorporate these ideas into a road project. Thank you.

Mr. MINETA. We have a call of the House at the present time. Do other members have questions of Congressman Boucher?

[No response.]

Mr. MINETA. If not, we will go ahead and release you at this point and recess for 15 minutes and come back after the vote.

[Mr. Boucher's prepared statement follows:]

OPENING STATEMENT OF
CONGRESSMAN RICK BOUCHER
HEARINGS ON REAUTHORIZATION OF THE POST-
INTERSTATE SURFACE TRANSPORTATION PROGRAMS

SUBCOMMITTEE ON SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
MARCH 15, 1990

Mr. Chairman and Members of the Committee, I would like to thank you for allowing me the opportunity to speak on behalf of a vital transportation project in Southwest Virginia. The proposed highway linking Virginia Polytechnic Institute and State University, the largest university in the Commonwealth, with Interstate 81 deserves your most serious consideration.

You have heard during the last week of testimony about the importance of transportation to spur economic development, to provide productivity gains in industrial and service sectors, to enhance international competitiveness, and to meet the nation's mobility needs for the purpose of sustaining our standard of living and economic vitality.

Also, you have heard about the problems of highway congestion, air pollution and accidents. Mention was made of "Intelligent Vehicle/Highway Systems," also referred to as "Smart Cars - Smart Highways," intended to make vehicular traffic safer, more efficient, and more environmentally benign. These technologies include improvements in traffic management, driver information, and vehicle control techniques made possible by recent advances in computers, electronics and telecommunications. The Honorable Samuel K. Skinner, the U.S. Secretary of Transportation, in his statement on March 8, 1990 to this

Subcommittee, proposed budget increases for research and development in these technologies to "facilitate movement of people and goods." The advancement of transportation technology into the 21st century is a major theme of Mr. Skinner's policy.

It is an important theme, particularly in the context of Intelligent Vehicle/Highway Systems (IVHS), because Japan and Europe are already ahead of us in this type of research. According to last week's U.S. News and World Report, Japan and Europe have already invested $2.0 billion dollars in the new technologies. To supplement the efforts of U.S. auto companies in the development of "Intelligent Vehicles," the federal government needs to build "Intelligent Highways," which permit researchers to experiment with the interaction between cars and roads. We must start now if we are to catch up with Europe and Japan.

Today, I am pleased to inform you about a unique opportunity for a 6-mile highway link in Southwest Virginia that is ideal for a demonstration project of IVHS. The project will develop, test, and evaluate specific IVHS technologies, and determine their impact on the economic development of the region. To my knowledge, this would be the first "Intelligent highway" to be constructed from the ground up in the United States.

The highway link connects Virginia Polytechnic Institute and State University with the Roanoke Valley and its industries and emerging high-tech companies. The university has an outstanding reputation for its research capabilities. It also has a

Corporate Research Center which is designed to bridge public and private sector research interests. The university's total research expenditures in the 1988-1989 academic year were $104 million. It is ranked annually in the top 20 universities in terms of percentage of research programs funded by the private sector. In the spring of 1989, the university awarded 1,191 masters degrees and 303 doctoral degrees. In its latest survey, the U.S. News and World Report ranked the university's graduate engineering program number 22 out of some 200 engineering schools in the nation.

The purpose of the link, referred to as the "University Connection," is to bring these two communities closer together and to relieve the current traffic congestion on the existing road. Both communities are supportive of this project because of its potential boost to the local economy and its related impact on traffic.

Access to a major research university has become a principal criterion for attracting and retaining industry. The traditional economic base is changing to technology-driven companies. In nearby Roanoke, for example, there are more companies involved with fiber optics than in any other region of Virginia. It is no coincidence that Virginia Tech is the home of the Fiber and Electro-Optic Research Center and has the largest teaching program in fiber optics in the country. To continue that development and draw other high tech firms to Southwest Virginia, the university must be directly connected with the interstate,

38-253 O—91——19

which runs through the heart of Southwest Virginia.

The Virginia Department of Transportation, the university, and the local authorities have established two committees--one conceptual and one technical--to study the issues involved in implementing IVHS technologies on this road. In this regard, we are holding a major conference on IVHS involving government, industry, and university.

A four-lane road is initially planned for this link, with one additional lane to be used as a test bed for IVHS technologies. We propose that the traffic lanes of the planned highway be used to experiment with existing and near-term technologies as they relate to advanced driver information and safety, and the extra lane be used to develop and test mid- and long-term technologies such as automated highway/vehicle control systems. The estimated cost for the highway is approximately $117 million.

We ask that, in the Reauthorization bill of the Surface Transportation Act, an amount of $95 million be allocated to this demonstration project with the remaining funds coming from state and local governments and industry. Successful implementation of IVHS technology requires a cooperative effort from government, industry, and higher education. This project would provide an excellent opportunity for such cooperation.

The location of the road is ideal for testing the application of IVHS technologies in rural areas, which is certainly needed if these systems are to be deployed nationwide.

The rolling mountainous terrain and four-season weather in Southwest Virginia provide an opportunity to test the workability of driver information and response and of vehicle guidance and control under different environment and road conditions. The two-lane road is suitable for testing the in-vehicle safety warning systems activated by means of permanent or portable devices displayed on or near the roadway.

Let me cite two examples. A driver is about to move into the left lane to pass a vehicle in front, when a warning signal goes off--there is a car in the driver's "blind spot." The driver, then, can wait until the car goes by and move out safely. In another case, a driver is tired after driving for hours on a road and the car starts drifting off the lane, but a sensor in the vehicle immediately identifies what is happening, and alerts the driver who steers the car back on course. These examples of advanced driver information systems could be introduced in the 1990s and tested on this road. It is estimated that more than half of all fatal accidents occur on straight sections of roads where the driver is generally at fault. These devices are targeted to reduce these types of accidents and enhance overall driver safety and convenience.

The goal of Automated Highway/Vehicle Control Systems, according to the Federal Highway Administration, is to provide higher vehicle carrying capacity for a given amount of right-of-way and to increase future levels of highway service for inter-city and rural highway travel. The dedicated extra lane on this

proposed facility will be used to conduct full-scale engineering tests to determine the design and fabrication requirements of fully and partially automated vehicle control in a real-world operational setting. The construction costs of the test bed, including its safety consideration, would be less expensive in a rural area than in an urban area. In addition, the environmental impacts, in terms of relocating residents and businesses, would be minimal.

In addition to determining the technical feasibility of these systems, it is important to determine their economic impacts on the region. It is expected that the Intelligent Vehicle/Highway Systems will draw industries and associated developments to the area in which they are deployed. The Roanoke Valley, in its growing stage, will provide an excellent laboratory for measuring the developmental impacts of these technologies on a region.

Although the preliminary studies for site location have been completed, the road itself has just been added to the Virginia Department of Transportation's six-year plan. If funding became available, construction is not expected to begin before the mid-1990s.

We all know that it takes at least five to six years to build a highway in a rural area, and eight to nine years in an urban area. If we want to test and demonstrate the utilities of IVHS technologies on a newly constructed highway before the end of this decade, it is important that we authorize a research and

development project in this coming bill.

Thank you for giving me the opportunity to speak on this important topic. I will be pleased to answer your questions at this time.

[Recess.]

Mr. MINETA. The subcommittee will please reconvene.

At this time I would like to call forward our very fine colleague from Virginia, Congressman Bateman.

Congressman Bateman, we have your full statement. It will be made a part of the record, so you may go ahead and proceed in your own fashion.

TESTIMONY OF HON. HERBERT H. BATEMAN, A REPRESENTATIVE FROM VIRGINIA

Mr. BATEMAN. Thank you, Mr. Chairman and members of the committee. I am delighted to have this opportunity to testify today on the need for Federal assistance to expand the capacity of the Coleman Bridge.

The Coleman Bridge carries Route 17 across the York River, connecting Yorktown and Gloucester Point, and provides the link between Gloucester County and the metropolitan area that includes the cities of Hampton and Newport News.

The bridge provides direct access to the Colonial National Historic Park and the Colonial Parkway, a Federal highway that connects two of the most important sites in American history, the battlefield at Yorktown and the first permanent English settlement in America at Jamestown. The bridge also is vital to the workforce at the Yorktown Naval Weapons Station, the Coast Guard Reserve Training Center, and numerous other Federal military facilities on the peninsula.

Since the bridge was designed in the 1940s, Gloucester County has changed from a quiet rural area to a burgeoning suburban commuter community, and the Hampton-Newport News area has grown even more dramatically. In fact, in the last decade alone Gloucester County's population has grown by 30 percent, and it has more than doubled since the bridge was built. This unforeseen growth in commuter traffic—growth which is likely to continue—has created a terrible bottleneck at this York River crossing site where Route 17 narrows from four lanes to two lanes. Your committee is more than slightly aware of gridlock and bottlenecks, but there are few if any that so greatly impact Federal activities and requirements.

Needless to say, the decision on how to provide additional capacity for crossing the York River has evoked a great deal of interest and discussion. Many individuals and groups endorsed construction of an upriver crossing. This upriver crossing would have provided improved access to the Interstate System and would have helped to relieve the severe congestion on Route 17 south of the York River. Despite these significant advantages, however, the Commonwealth of Virginia chose the less comprehensive and less expensive option of rehabilitating the existing bridge and adding two more lanes at the current site. Federal funding of that upriver bridge option, or of an even more expensive tunnel option, is not being requested. A request is being made only for Federal participation in the least expensive alternative.

Even this less comprehensive option, however, is quite costly, and much of this cost is a direct result of Federal facilities located

near the bridge. In addition to the matters mentioned earlier, I ask the committee to consider the fact that the Yorktown Naval Weapons Station and the Cheatem Annex Naval Supply Center are upriver from the bridge, and the presence of those facilities requires the bridge to include a high-level swing span which can be opened to allow naval vessels and supply ships access to load and unload weapons and supplies.

I believe, and I hope you will agree, that it is only fair that the Federal Government should assume the costs attributable to navigation of naval vessels. Since the Navy accounts for virtually all of the navigation on the York River which requires the swing span and additional height, and because of the other compelling national interests, I request that the committee provide the necessary funds to the Commonwealth of Virginia to defray the cost of upgrading and expanding the existing York River crossing.

During the last reauthorization of surface transportation legislation your committee recognized the Federal role in this project and provided $2 million in design and site selection funds. I urge the committee to follow that initial support for planning funds with approval of the construction funds necessary to make this much-needed project a reality.

I am, certainly aware of the many infrastructure needs this country is facing and of the many requests you will receive for funds. However, I would greatly appreciate any assistance which you can provide for the realization of this project, which is so inextricably connected to Federal interests and national security requirements.

I thank the committee very much, and would only note that the absence of people flanking me at the committee table is not due to a lack of interest and concern for this project. It was a matter of the Congressman, namely me, not being able to choose which of many should be here.

Mr. MINETA. Thank you very much, Congressman Bateman. I have been in that position of being with my friends, also.

You indicate a need for continued Federal support to expand the capacity of the Coleman Bridge based on the fact that we put $2 million in design and site selection funds for this project in the 1987 act. Your request for continued Federal participation in the Coleman Bridge expansion is linked to some very particular Federal interests, namely, the Yorktown Naval Weapons Station, the Cheatem Annex Naval Supply Center, and the historic importance of the Yorktown Battlefield and the Jamestown Settlement.

The other day we heard a suggestion that a new Highway Assistance Program be established when we complete the Interstate Highway Program, and this would be to fund highways, including bridges, of what is called "Highways of National Significance."

Mr. BATEMAN. Yes.

Mr. MINETA. Now, if the committee agreed to establish such a new program, giving the Department of Transportation of the State of Virginia, as well as other States, funds which they could then use for projects of national importance like the one you described, do you think that that would respond to the need that you have just described?

Mr. BATEMAN. Mr. Chairman, I would say that it certainly would be contributory to solving that problem.

Another aspect of this, and you've mentioned it in your question, is the need nationwide for the improvement and upgrading of our bridge structures, our existing bridge structures. That is a very common and recurring problem throughout Virginia and I think throughout the Nation. Perhaps as a part of your structuring of the next surface transportation bill there should be something that speaks to programs that expedite meeting those requirements, which certainly would fit in also with the accomplishment of the objectives of crossing the York River.

I would repeat, however, that while it is most clearly a highway of national concern, it is more than that generically. This is a project of rather specific Federal and national interest and concern, not to denigrate the merit of something that is more comprehensive than that.

Mr. MINETA. Thank you very much.

Mr. BATEMAN. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Packard?

Mr. PACKARD. I have no questions, Mr. Chairman.

Mr. MINETA. Mr. Grant?

Mr. GRANT. No questions, Mr. Chairman.

Mr. MINETA. Mr. Bateman, thank you very, very much.

[Mr. Bateman's prepared statement follows:]

PREPARED STATEMENT OF HON. HERBERT H. BATEMAN REGARDING THE COLEMAN BRIDGE

I want to thank you for giving me the opportunity to testify today on the need for Federal assistance to expand the capacity of the Coleman Bridge. The Coleman Bridge carries Route 17 across the York River connecting Yorktown and Gloucester Point and provides the link between Gloucester County and the metropolitan area that includes the cities of Hampton and Newport News.

The bridge provides direct access to the Colonial National Historic Park and the Colonial Parkway, a Federal highway that connects two of the most important sites in American history—the battlefield at Yorktown and the site of the original Jamestown settlement. The bridge also is vital to the work force at the Yorktown Naval Weapons Station, the Coast Guard Reserve Training Center, and numerous other Federal military facilities on the peninsula.

Since the bridge was designed in the 1940's, Gloucester County has changed from a quiet rural area to a burgeoning suburban commuter community, and the Hampton-Newport News area has grown even more dramatically. In fact, in the last decade alone, Gloucester County's population has grown by 30 percent and it has more than doubled since the bridge was built. This unforeseen growth in commuter traffic—growth which is likely to continue—has created a terrible bottleneck at this York River crossing site where Route 17 narrows from 4 to 2 lanes. Your committee is more than slightly aware of gridlock and bottlenecks. But there are few if any that so greatly impact Federal activities and requirements.

Needless to say the decision on how to provide additional capacity for crossing the York River has evoked a great deal of interest and discussion. Many individuals and groups endorsed construction of an upriver crossing. This upriver crossing would have provided improved access to the Interstate System, and would have helped to relieve the severe congestion on Route 17 south of the York River. Despite these significant advantages, however, the Commonwealth of Virginia chose the less comprehensive, less expensive option of rehabilitating the existing bridge and adding two more lanes at the current site. Federal funding of that upriver bridge option—or of an even more expensive tunnel option—is not being requested. A request is being made only for Federal participation in the least expensive alternative.

Even this less comprehensive option, however, is quite costly, and much of this cost is a direct result of Federal facilities located near the bridge. In addition to the matters mentioned earlier, I ask the committee to consider the fact that the York-

town Naval Weapons Station and the Cheatem Annex Naval Supply Center are upriver from the bridge and the presence of those facilities require the bridge to include a high-level swing span which can be opened to allow naval vessels and supply ships access to load and unload weapons and supplies.

I believe—and I hope you will agree—that it is only fair that the Federal Government should assume the cost attributable to navigation of naval vessels. Since the Navy accounts for virtually all of the navigation on the York River which requires the swing span and additional height, and because of the other compelling national interests, I request that the committee provide the necessary funds to the Commonwealth of Virginia to defray the cost of upgrading and expanding the existing York River crossing.

During the last reauthorization of surface transportation legislation your committee recognized the Federal role in this project and provided $2 million in design and site selection funds. I urge the committee to follow that initial support for planning funds with approval of the construction funds necessary to make this much-needed project a reality.

I am certainly aware of the many infrastructure needs this country is facing and of the many requests you will receive for funds. However, I would greatly appreciate any assistance which you can provide for the realization of this project which is so inextricably connected to Federal interests and national security requirements.

Mr. MINETA. At this time I would like to call on a very fine colleague from Virginia—today must be Virginia Day—Congressman Jim Olin.

Congressman, we are pleased to have you. We have a copy of your statement. It will be made a part of the record, so you may go ahead and proceed in your own fashion.

TESTIMONY OF HON. JIM OLIN, A REPRESENTATIVE FROM VIRGINIA

Mr. OLIN. Thank you very much, Mr. Chairman. I am very happy to have this opportunity to testify before the committee today.

I am here to ask you to reauthorize the Roanoke River Parkway Project, which was first authorized in the Surface Transportation Act of 1987.

I think that this committee has not had a presentation on this project, so first I'm going to describe the project to you a little bit before I get into where it stands and what the financial situation is.

This is a parkway, a demonstration project that provides for construction of a 10-mile extension of the Blue Ridge Parkway. It will run along the Roanoke River between the city of Roanoke and Smith Mountain Lake, which is a large recreational lake with 500 miles of shoreline and a major recreational facility. Part of the demonstration project is that the parkway will provide access to the Explore Project, a Virginia State Park which will recreate the American frontier experience. Explore will consist of several historic replicas of frontier towns and Indian villages, and most of Explore will be funded by private contributions.

[Information on Explore Project follows:]

BLUE RIDGE TOWN
REFORM PROJECT

The Explore Park Master Plan consists of several unique aspects. The park will be the largest North American animal facility in the nation. Its American Indian cultural center will be a first in the country. The park will be unmatched in its integration of natural and cultural history exhibits. Further, it will be the first facility in the nation to tell the story of Virginia's involvement in the pioneering history of the continent, from early Appalachian exploration to the Lewis and Clark Expedition and beyond. The Explore experience will include:

1) Blue Ridge Traveler's Village and Welcome Center
2) Ridgeline Resort
3) University Research Camp
4) Historic Farm
5) American Indian Park
6) Blue Ridge Town

Its American Wilderness Park will include:

7) Old Virginia
8) Great Plains
9) Rocky Mountains
10) Far West, including Northwest, Southwest, and Alaska
11) Environmental Education Camp

In this section of the Master Plan each phase of the Explore Park will be described, beginning with a history background. Following the history will be a walk-through description of the same Explore phase, including the exhibits and other sights to be encountered by a visitor.

MASTER PLAN

M. Olin
Explore

"For the first time, in one place, the American Indian story will be told from the Native American perspective. Each Explore visitor should develop a deeper appreciation of our continent's Native American cultures and heritage."

Dr. Veronica E. Tiller, member, Explore's Native American Advisory Committee

EXPLORE'S ENVIRONMENTAL AND EDUCATIONAL PROGRAM

All too frequently history and geography have lost their humanizing luster. They are taught through memorization, multiple-choice, and fill in the blanks. How then, can we expect students to understand and appreciate the efforts of eighteenth and nineteenth century pioneers who developed our nation?

Envisioned as an outdoor classroom and living museum, EXPLORE will enable visitors to experience firsthand, through natural and cultural exhibits, the landscape, wildlife and civilizations of America's first century of exploration. It will be unmatched in its integration of natural, cultural and historical exhibits.

A major environmental destination for the nation's eastern corridor, EXPLORE considers numerous facets of the eco-system, weaving together environmental appreciation, conservation, research to preserve species, and the joy of experiencing through all the senses the realm and diversity of life.

EXPLORE'S environmental story will take a world wide view. On the minds of people everywhere is the thought that we must begin to take better care of our planet, our plants as food sources, animals and wildlife as part of larger eco-systems, and ourselves, humans entrusted with the world's future.

The Children's Environmental Education Camp will be designed to teach young people about their role in their community's and the world's future. They will have an opportunity to learn that they can make a difference in the environment around them.

In addition, Explore's environmental, historical and educational programs will be of interest to public and private agencies, and to numerous states and countries that share a historical relationship with Virginia.

EXPLORE'S NATIONAL PERSPECTIVE

A national program, ambitious in scope, EXPLORE involves both the federal and state governments, the citizens of six local jurisdictions, and a professional staff and consultants who work together to develop project guidelines and plans.

EXPLORE has created a History and Geography Advisory Committee, bringing together historians and members of the U.S. Congress who share a common interest in the story of the nation's pioneering efforts.

EXPLORE has created an Advisory Committee comprised primarily of Native Americans and historians intimate with the story of Native Americans. This committee will assist in defining the interpretative scope of the Native American Park.

In addition, EXPLORE has committees for education, development of the Blue Ridge Town, and coordination of a Visitors Center on the Blue Ridge Parkway.

EXPLORE'S ACCOMPLISHMENTS

EXPLORE has:

- adopted major goals: History Preservation, Education, Environment.
- adopted a Master Plan, the result of historical research, federal and state appropriations, community involvement, economic analysis, and site evaluation.
- selected a core site.
- purchased over half of its proposed 2,000 acres.
- accepted over 20 historic and endangered buildings for preservation and restoration in the town.
- obtained over $40 million in public and private funding.
- begun a private, philanthropic fund-raising program.
- created a 25-mile river greenway plan with designated conservation and recreation areas, including a 54-mile extended bicycle path to Virginia Tech, and a 10-mile extension of the Blue Ridge Parkway.

EXPLORE is a project of The River Foundation, a private, non-profit, 501 (c)(3) organization, interested in promoting conservation of the scenic and environmental quality of the Roanoke Valley. The River Foundation works in conjunction with the Virginia Recreational Facilities Authority, which oversees the state parklands associated with EXPLORE.

The River Foundation
401 South Jefferson Street
Roanoke, Virginia 24011
703/345-1296

"The Explore Project is my home state transcends Virginia significance. It has national implications. In fact, Explore's Town, Native American project and wilderness park will be the first of their kind anywhere in the world."

BLUE RIDGE TOWN

The Blue Ridge Town, a re-created historic village, will have exhibits that will portray early Virginia life. Along Main Street will be the sights and sounds of a frontier town, shops for a gunsmith, wagon maker, baker and blacksmith. There will be a courthouse, operating with jail, church and tavern.

A wide range of guest lodging, including bed and breakfast, will be available in the Town. Restaurants will feature food of the 17th-19th cts. beginning with colonial meals and flavors.

The town also will have program buildings and farms, riverfront agriculture, a military encampment and a school house. Nearby, carved in the hillside will be an amphitheatre.

EXPLORE place numerous other educational and recreational activities in the Blue Ridge Town, including: orienteering, crafts, horseshoes, archery, fairs, festivals and tavern.

NATIVE AMERICAN PARK

The Native American Park will be approached first through the great tavern. Sculptures and the structures will be a village and a ceremonial area. Trails for visitors will lead to an overlook Native American Village, and outside.

A forested valley, which is reserved for exclusive use of the Native American, will be a homeland area that will have a village, houses for living, sleeping, or other purposes.

The Museum's Exploring the Trail exhibit, representing the road through the Appalachians from Europe to the Indian, will be a center. The park will be a working, and [illegible] Native American presentations and [illegible].

Shared experiences.

Authentic crafts from the native tribes will highlight their way of life and be available for sale.

AMERICAN WILDERNESS PARK

The history of Western [illegible] the Blue Ridge Town [illegible] Park [illegible] and [illegible] Wilderness Park [illegible] [illegible] [illegible]

OVERVIEW

EXPLORE is a 2,000 acre family oriented history and entertainment park being created along the Blue Ridge Parkway near Roanoke, Virginia. Located where the Roanoke River cuts through the Blue Ridge Mountains, EXPLORE will be a place to have fun, and to learn.

EXPLORE will primarily be a story of two cultures – Native American and pioneer – and how they interacted. Here will be examples of how the two dealt with lodging, furnishings, transportation, religion, medicine, family, and entertainment.

EXPLORE will incorporate several distinctive aspects, fitting them together into cohesive stories that are both emotionally and intellectually stimulating. It will conserve the region's scenic setting while integrating natural and cultural exhibits, centering on three main elements: Blue Ridge Town, Native American Park, and American Wilderness Park.

The Blue Ridge Town will tell, for the first time in one place, Virginia's role in the nation's western exploration. A pioneer village of the eighteenth and nineteenth century, the town will realistically depict the story of frontier families, including Germans and Scotch-Irish, who pushed our nation's boundaries from the Appalachian Mountains to the Pacific Ocean.

"Explore is a very exciting concept for providing a unique recreational and historically educational experience for millions of Americans. As you might imagine, I am particularly interested in Explore's interpretation of our nation's westward expansion, particularly through my State of Idaho to the Pacific coast."

Honorable James A. McClure, U.S. Senator (Idaho), member of Explore's History and Geography Advisory Committee

The town will host crafts people and artisans who will re-create authentic tools, clothing and handmade crafts from a bygone era. Arts and crafts from pioneer and Native American cultures will be made on site for show and sale. Exhibits will change frequently and include full time and guest artisans.

The Native American Park, an authentic depiction of Indian cultures on the North American Continent, will be the first of its kind in the world. It will tell the story of Native American history from their perspective. The park will have a village and museum where living exhibits and artifacts will tell about our continent's first environmentalists.

The American Wilderness Park, a 750 acre historical zoological facility, will emphasize exploration and discovery. This park will be the largest, most comprehensive collection of North American animal species known in the world. Animal preserves will be interpreted in a manner consistent with the early history of the region portrayed.

Lodging, restaurants and shopping will be available in every area of the park, offering unique crafts and specialties. A campground and full range of hotel lodging will be priced to suit a variety of budgets, with additional activities for the family, including horseback riding and a first class golf course.

PIONEERS

From colonial days the Blue Ridge foothills served as the home and training ground for countless American pioneers. This was the edge of the young nation's frontier, and it was in these foothills that our national character was bred. This area boasts such names as Thomas Jefferson, Cumberland Gap discoverer Thomas Walker, George Rogers Clark, Meriwether Lewis and William Clark, Sam Houston, and Stephen Austin.

This is where explorers began a search – for an American identity and for the limits of the continent on which they would live. They had many traits in common: courage, curiosity, principle, spirit, and self reliance – traits that are symbols of our national character and worth perpetuating.

"Virginia's role in the nation's pioneering efforts is a story that has never been adequately told. Explore will tell this story and has assembled a fine group to spread the word to the nation."

Virginia Dabney, Virginia historian and author, member of Explore's History and Geography Advisory Committee

It took a century to settle the land from western Virginia to the Pacific Ocean. Yet, the role of Virginians, especially women and blacks, in developing the American frontier is a story that has not been adequately told. EXPLORE will tell this story.

NATIVE AMERICANS

Long before any European arrived, this continent was populated by the ancestors of today's Native Americans. Hundreds of tribes inhabited the land by the time Europeans appeared. These natives were not of one tribe, but were several separate linguistic families with hundreds of dialects. Boundaries were natural geographic features.

Inevitably, the two cultures were at odds. The Native American was part of the land, the settler "owned" it. There were fair and humane representatives of both cultures, but others on both sides instigated great atrocities. In the end, it was the Native American who suffered from the scattered colonies that exploded into an engulfing wave of settlements.

No story of the American wilderness is complete without the Native American story – from their perspective. There is no better place to tell it than in Virginia's upcountry.

Mr. OLIN. The Roanoke River east of Roanoke, is a beautiful river gorge which is essentially parkland, unspoiled right now by itself.

The project that we are describing shows on this map, if I can talk from it. This yellow line is the Blue Ridge Parkway, 470 miles of parkway, that runs right next to the city of Roanoke, which is right here. The red line shows the demonstration project, terminating on one end at the city of Roanoke, going through this State Park with access to the State Park as part of it, and arriving at the edge of Smith Mountain Lake down in the lower corner. The access to Explore will be off of the Blue Ridge Parkway by a spur, and there will be a visitor center right at that junction which will be used to describe recreational opportunities in this general area.

The Explore Project itself, which is not a Federal project, to give you some idea, this is a little map of that. Here is the Roanoke River. Here is the Blue Ridge Parkway coming down. It shows you the relationship of those activities.

Now, the whole concept will demonstrate how parkway extensions of this nature can enhance the recreational development of an area and also compliment the value of the Blue Ridge Parkway. The Roanoke River Parkway will provide easy access to recreational opportunities in Roanoke, Smith Mountain Lake, and the State Park.

Mr. Chairman, in 1987 Congress authorized $12 million for this road that I'm talking about, to be matched by $3 million from the State. Congress also appropriated $450,000 to pay for planning of the visitor center. At the same time, Virginia appropriated $2 million to start the planning of Explore Project, and later, $6 million for land acquisition. That land acquisition is almost completed. At the same time, private contributions were being received to build the historic town and all the other things.

About a year ago the National Park Service, the Federal Highway Administration, and the Virginia Department of Transportation started working together in planning the parkway and the visitor center. A draft environmental impact study has now been finished and will be finalized in the next few months. A record of decision is expected in November, and then we will be ready to begin engineering and design.

At this point everyone involved with this project is extremely pleased with the way the project is taking shape. We think it is going to be a very attractive and effective addition to the Blue Ridge Parkway. We feel confident that the objective of the demonstration project will be achieved, and that the parkway will greatly enhance the recreational opportunities in the Roanoke Valley and become a principal feature of the Blue Ridge Parkway.

But, Mr. Chairman, the cost of the project appears to be considerably more than was originally authorized. We really are not prepared to talk today about a final definitive cost because the planning process isn't finished and we haven't done sufficient engineering yet to really fine-tune the estimates. But we have obtained from the Federal Highway Administration their rough estimate of what it is going to take to finish this project. We think we are going to be needing an additional $67 million to $79 million.

Between now and spring of next year there is going to be a lot of work done, and I expect that the parties involved are going to work together to develop the best possible value for our money on this project. By the time this committee gets ready for markup of your bill next year I hope to be back in front of you, giving you a firm cost estimate, one that has been thoroughly reviewed.

We want this parkway built consistent with the high standards of the National Park Service, but we also want a parkway that is cost-effective. This demonstration project will give us an opportunity to test the parkway standards against the needs for a practical roadway that is functional and can be afforded. It is essential that we achieve good value, and that it be seen in everyone's eyes as being a good investment. I expect plenty of head-knocking to be done to achieve this objective in the next year, roughly.

We are asking for authority to build the whole project, but we realize that we may have to build the road in sections over a period of years. I want to emphasize, however, that it is essential that the first section of the road, the one that connects the Blue Ridge Parkway to the Explore Project, is of the highest priority. It is the most vital. It is important that we get authorization to get that started in 1992, to dovetail with the development of Explore.

This priority section and other sections of the road will be fully described when we meet with you next spring.

Mr. Chairman, this is a good project. Both Virginia Senators are behind it. We expect Senator Warner to make the same request to the Senate committee.

The program is on schedule. It will achieve its objectives and add a valuable enhancement to our National Park System.

Mr. Chairman, we hope that the committee can give careful and favorable consideration to our request.

Mr. MINETA. Thank you very much, Mr. Congressman.

Jim, as you indicate in your own statement, $12 million has already been authorized for the 10-mile extension of the Blue Ridge Parkway to provide access to the State of Virginia's Explore Project. This was done in the Senate amendment to the Surface Transportation Act.

Mr. OLIN. Correct.

Mr. MINETA. Now you are seeking an additional authorization of between $67 million and $79 million for the Roanoke River Parkway.

My question really concerns whether these funds are needed solely because of increase of costs in the project which was originally authorized, or whether there has been a change in the project as it relates to the length of the project or its capacity or other design features.

Mr. OLIN. No, Mr. Chairman, there has been no change in the concept of the road, its length, or even its general location. The reason we are on a different funding level is really two-fold. One, the original authorization was made when this was only a concept and hadn't really been studied carefully. I think the original request on the Senate side was for $20 million. That was cut back in the committee process.

What we have now is one that has been based on about a year and a half of careful study. I think the $20 million that was first

thought of was more based on a roadway that might be running through the countryside on relatively rolling land, and what we are finding here is that the terrain along this river gorge is a little more difficult to build a road on than we used in the original estimate. There are two bridges over the Roanoke River, which was not a surprise, but there are a lot of other bridges that are necessary to meet parkway standards and to have this road be functional the way it should be.

I don't make any apology for the amount of money that is here. We are obviously going to have to be sure that we hone it down, but there wouldn't be any point in building this unless we built it right. This is going to be in effect for generations. It's part of the National Park System and it must be something that will give credit to that system.

Mr. MINETA. Since the roadway is connected to a recreational facility, is there a charge to get into the recreational facility?

Mr. OLIN. I believe there will be a charge for that Explore Project. It will be a State/private type enterprise.

Mr. MINETA. And has there been any consideration by the State of Virginia or others supporting this project of using tolls to finance the project?

Mr. OLIN. I don't believe so, Mr. Chairman.

Thank you very much.

Congressman Shuster?

Mr. SHUSTER. Thank you, Mr. Chairman.

I certainly appreciate your testimony, my good colleague, and look forward to working to help it come true.

Mr. MINETA. Mr. Packard?

Mr. PACKARD. No questions, Mr. Chairman.

Mr. MINETA. Jim, thank you very, very much for your presentation here——

Mr. OLIN. If I could add one more note?

Mr. MINETA. Absolutely.

Mr. OLIN. Mr. Payne, who is on the committee, is my neighbor in Virginia. Part of this project lies in my district and part of it lies in his. I thought you might be interested in that fact.

Mr. MINETA. Very well.

[Mr. Olin's prepared statement follows:]

TESTIMONY OF CONGRESSMAN JIM OLIN
BEFORE THE SURFACE TRANSPORTATION SUBCOMMITTEE OF
THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE
THURSDAY, MARCH 15, 1990

Mr. Chairman, I'm happy to be here today to testify before this committee. I'm here to ask you to reauthorize the Roanoke River Parkway project, which was first authorized in the Surface Transportation and Uniform Relocation Assistance Act of 1987.

I'd like to describe this project to you. This parkway is a demonstration project that provides for construction of a 10-mile extension of the Blue Ridge Parkway. It will run along the Roanoke River between Roanoke and Smith Mountain Lake, a major recreational facility.

Part of the demonstration concept is that the parkway will provide access to the Explore project, a Virginia state park that will recreate the American frontier experience. Explore will consist of several historical replicas of frontier towns and Indian villages. Most of the Explore project will be funded by private contributions.

At the intersection of the Blue Ridge Parkway and the Roanoke River Parkway will be a Visitor Center that will provide information about all the recreational opportunities available in the region.

This whole concept will demonstrate how parkway extensions can enhance the recreational development of an area and complement the value of the Blue Ridge Parkway. The Roanoke River Parkway will provide easy access to the recreational opportunities in Roanoke, Smith Mountain Lake and the state park.

In 1987, Congress authorized $12 million for this road, to be matched

with $3 million from the state. Congress also appropriated $450,000 to pay for the planning of the Visitor Center.

Meanwhile, Virginia appropriated $2 million to start planning the Explore project and another $6 million for land acquisition. At the same time, private contributions were being received to build the historical towns.

About a year ago, the National Park Service, Federal Highways Administration and the Virginia Department of Transportation started the planning for the parkway and the Visitor Center. The draft Environmental Impact Study has been finished and will be finalized in the next few months. A record of decision will be made in November and we'll be ready to begin engineering and design.

At this point, everyone involved is very pleased with the way the project is taking shape and we think it's going to be an attractive and effective addition to the Blue Ridge Parkway. We feel confident that the objective of the demonstration project will be achieved and that the parkway will greatly enhance the recreational opportunities in the Roanoke Valley.

But, the cost of the parkway is going to be considerably more than was originally authorized. We really aren't prepared to talk about a final, definitive cost because the planning process won't be finished until late this year and we haven't done sufficient engineering to make a firm estimate. But, we have obtained from the Federal Highways Administration their rough estimate of what it's probably going to take to finish the project.

We think we're going to need an additional $67 to $79 million. Between now and the end of the year there's going to be a lot more work

done and I expect all the parties involved to work together to develop the best possible value for our money. By the time this committee gets ready to mark-up a bill next year, I'll be able to come back to you and give you a firm cost that's been thoroughly reviewed.

We want this parkway to be built consistent with the high standards of the National Park Service. But we also want a parkway that is cost effective. This demonstration project will give us an opportunity to test the present standards against the need for a practical roadway that is functional and can be afforded. It is essential that we achieve good value that will be seen in everyone's eyes as being a good investment. I expect plenty of head-knocking to be done to achieve this objective.

We are asking for authority to build the whole project, but we realize that we may have to build the road in sections over a period of years. I want to stress that it is essential that the first section be the one that links the Blue Ridge Parkway with the Explore Project. That section needs to start construction in 1992 to dovetail with Explore project development. This priority section and the other sections will be fully described when we meet with you next spring.

Mr. Chairman, this is a good project; it's on schedule; it will achieve its objective and add a valuable enhancement to our national park system. I ask the committee to give serious consideration to letting us finish what we have started.

Mr. MINETA. At this time I would like to call forward the Governor of the Commonwealth of Virginia, the Honorable Lawrence Douglas Wilder. Governor Wilder will be accompanied by Senator Warner, as well as John Milliken, the Secretary of Transportation for the Commonwealth of Virginia, as well as our very fine colleague on the committee, Congressman L.F. Payne.

We are pleased to have the Governor here with us today, and to do the honors I would like to call on our very fine Senator from the Commonwealth of Virginia, Senator Warner.

Senator WARNER. Thank you, Mr. Chairman, Mr. Shuster, members of the committee. It indeed is an honor for me to come over and participate in this historic event, namely, the first appearance by the Governor of the Commonwealth of Virginia, Governor Wilder, before the Congress of the United States.

He could not have selected a more important subject than this one, namely, transportation. It ranks among the top three critical issues in our State, and he is putting his full faith and credit behind the effort to see that the Commonwealth of Virginia gets a fair—and underline fair—proportion of those dollars extracted by the Federal Government in the process of collecting that portion of tax that the Federal Government collects, and seeing that it eventually comes back to the Commonwealth of Virginia.

He is also ready to take on this struggle between the President and the Governors of the several States as we try, together with the Congress, to formulate this new policy whereby it is the President's judgment that more and more responsibility should be accepted by the States.

Just exactly how that will work out remains to be seen, Mr. Chairman. As you know, I serve on the counterpart committee to this one in the United States Senate, and we will be having testimony, and I hope that Governor Wilder will likewise appear before the Senate.

He is accompanied today by the new Secretary of Transportation, Mr. Milliken, who was sworn in last night to this post in preparation for the joint appearance today with the Governor.

I thank the chairman and members of the committee.

Mr. MINETA. I am going to call on my very fine colleague from Pennsylvania, Mr. Shuster.

Mr. SHUSTER. Thank you very much. We certainly welcome all of you to the committee today. Since three of my grown children live in Virginia—about half of my family is there—I sort of feel as though it is my second home. I look forward to being helpful as we proceed.

Mr. MINETA. I would now like to call on our very fine colleague on the Public Works and Transportation Committee and a member of this subcommittee who is doing a very fine job, Congressman L.F. Payne.

Mr. PAYNE. Thank you very much, Mr. Chairman.

We have in previous testimony here that the Commonwealth of Virginia has been very innovative in its approaches to improving modes of transportation in our Commonwealth. I think this was pointed out by Secretary Skinner when he was here and testified about the President's transportation plan and policy.

In many ways the Commonwealth of Virginia is a microcosm of the United States in that we have communities which vary from highly congested urban areas to extremely rural areas that need transportation corridors for economic development. Virginia has been very innovative in planning, developing, and implementing transportation systems to meet the needs of the State.

Governor Wilder has long been a leader in this transportation effort. During his 20 years of public service he has been a strong supporter of transportation initiatives throughout our Commonwealth and has long espoused the importance that infrastructure plays in competitiveness, not only domestically but internationally as well.

I would also like to recognize and welcome John Milliken, our new Secretary of Transportation. I think that in many ways John is coming home, having served as administrative assistant for our former colleague, Joe Fisher, here in the House of Representatives, and I think we in Virginia are very fortunate to have John as our Secretary of Transportation.

So I am extremely pleased to welcome our Governor, a Governor who has already displayed his capability and competence in the short time that he has been our Governor, and he has certainly made all of us in the Commonwealth of Virginia very proud.

Thank you for being here, Governor Wilder, and I look forward to your testimony.

Mr. MINETA. Thank you very much, Congressman Payne.

Senator Warner, it's nice to have you here.

Governor Wilder, it's great to have you here. Your statement will be made a part of the record, and if you would go ahead and introduce your Secretary of Transportation and proceed in your own fashion, sir.

TESTIMONY OF HON. LAWRENCE DOUGLAS WILDER, GOVERNOR, COMMONWEALTH OF VIRGINIA, ACCOMPANIED BY HON. JOHN WARNER, A U.S. SENATOR FROM VIRGINIA; HON. LEWIS F. PAYNE, Jr., A REPRESENTATIVE IN CONGRESS FROM VIRGINIA; AND HON. JOHN MILLIKEN, SECRETARY OF TRANSPORTATION, COMMONWEALTH OF VIRGINIA

Governor WILDER. Thank you very much, Mr. Chairman, Senator Warner, Congressman Payne, and Congressman Shuster. I am very pleased to have the occasion to be with you.

As has been noted, Secretary Milliken is here with me. I might add that Secretary Milliken lives in Arlington, so he brings with him a ready appreciation of gridlock [laughter] and of the problems that we experience, not only in the area of transportation in Virginia, but in Northern Virginia.

Mr. MINETA. Governor Wilder, let me interrupt for just a minute before you proceed.

I see a number of our colleagues from Virginia here. If the members of the Virginia delegation would like to come up here and be seated, please feel free to do so. If you have other obligations, don't feel that you have to come up—fine, Congressman Bateman, I understand that you have a prior commitment—but Congressman Sisisky and Congressman Olin, please join us.

I'm sorry. Go ahead, Governor.

Governor WILDER. That's all right, Mr. Chairman.

I appreciate the opportunity to testify and also to say on behalf of our colleagues in the Congress who have testified previously, it's a further attestation as to the significance that we attach to transportation problems in our Commonwealth. I think one of the most important issues facing us now in the Nation as a whole is the need to reenergize our partnership on transportation, and I stress the word partnership. We appreciate your consideration of our views and concerns.

During the 1980s Virginia's population grew by 12 percent, but highway travel in our Commonwealth increased by 50 percent, to more than 57.5 billion miles traveled. With 116,250 land miles of State-maintained highways, we have the third largest State highway system in the entire country, and not surprisingly, we are hard at work maintaining and improving our transportation systems.

We estimate that this year's transportation funding in the Commonwealth will total $1.8 billion, but still we are falling behind. Yet we are prepared to meet our transportation responsibilities, but we do expect the Federal Government to play its traditional part.

In my State of the Commonwealth Address on January 15th of this year I indicated that reenactment of the Federal Surface Transportation Act would be one of my top priorities. Consequently, I come here today to offer to work with you as a partner to achieve that objective.

As you consider these issues over the next several months, Mr. Chairman, I ask that you help to renew a partnership that will meet those national transportation needs. I can assure you that Virginia will do her part in this joint effort. But as a foundation for that partnership, we believe that the Federal Government should give to the taxpayers the transportation systems for which their Federal gasoline tax dollars have already paid.

With that objective as a beginning, I ask you to join with us in developing a forward-looking national transportation policy that will do the following:

Deal with the growing problem of congestion and its environmental consequences within our urban and suburban areas;

Reward efforts, such as those in Virginia, that make imaginative use of new financing techniques, as Congressman Payne has already alluded to several;

Three, push the private sector, as well as State and local governments, to continue research and development in the transportation field;

We must also focus on moving people, not just automobiles; and

Support our efforts to use transportation policy as a means to encourage economic development and progress in our rural areas.

We estimate that at the end of the fiscal year we will have a $179 million balance in the Trust Fund. These are monies that have been paid in motor fuel taxes, intended for highway improvements in the Commonwealth, but are being held hostage in the Old Executive Office Building, where they are not doing anyone any good. The sum of $179 million is the equivalent of nearly one year

of our current Federal program. We have projects in our urban and suburban areas just waiting for that money, which Virginia taxpayers rightly deserve.

I expect, Mr. Chairman, that this very morning—as a matter of fact, I know that you, yourself did—and other members of the subcommittee crawled through traffic in corridors that cried out for these funds. I say that I know that you did that, Mr. Chairman, because we waited for you about five minutes——

[Laughter.]

Governor WILDER [continuing]. When we called on you, and we were told by your staff, thank God they did tell us, "We think he's caught in traffic." I said, "I hope it's in Virginia." [Laughter.]

So, Mr. Chairman, my request is very simple: Let our money go. [Laughter.]

I urge that this subcommittee use its considerable influence in this body to set the Highway Trust Fund obligation ceiling at least $15 billion for the coming fiscal year. All of the studies show that this can be done safely, while maintaining the necessary reserves and funding the urgent needs. For my State, raising the obligation ceiling in this manner would add an additional $24 million in this year alone. I don't have to tell you, Mr. Chairman, that in your State it will add something like $234 million.

But ours is a national transportation system, not simply just 50 State systems linked together. The movement of goods and people in interstate commerce, as well as the requirements of national security, place this issue on your desk as well as mine.

Secretary Skinner acknowledges that we have to deal with the urgent issues of congestion in our urban and suburban areas, but he has yet to back that conclusion with flexible Federal dollars to address these problems. Moreover, he must acknowledge, as Virginia has done in its most recent initiative, that it costs more to build in congested areas, so the formula should be weighted accordingly.

Furthermore, Secretary Skinner needs to consider a special program focusing on these areas, one which will back up that rhetoric with funding. Likewise, the Secretary should reward States like Virginia that have addressed the issue head on through new initiatives and creative solutions.

Yes, we are flattered that reference was made in his report to the HOV lanes on I-95 and I-395, to partnerships with the private sector such as our Special Tax Assessment Districts on Route 28 near Dulles Airport, as well as the proposed private toll facility linking Dulles with Leesburg to the west. And yet, it would be more appreciated if he mixed his shower of praise with a sprinkling of dollars as well. [Laughter.]

Yes, we are heartened by his commitment to intensify Federal efforts in research and technology, such as our contemplated use of smart money technology between Roanoke and Blacksburg, which has been testified to, but breakthroughs come only after effort and a lot of shared costs, and only the Federal Government has both the resources and the national perspective to lead that research effort.

Yes, we know that he agrees with our view that transportation policy requires a balanced commitment to move people by transit, by automobile, by bicycle, and by foot. If he, you, join us, we will

finish the 103-mile Metrorail system in this area. We will bring commuters north by rail from Fredericksburg and Manassas. We will provide the transportation links in the regions of Virginia critical to national security. We will open up some of the rural areas of our State to the economic progress which can be provided by essential transportation links, such as Route 58 across Virginia's southern border.

Mr. Chairman, we are prepared to be that partner. We are prepared to do our share. We have significantly increased the resources of the Commonwealth devoted to this effort since the last time this committee considered the Surface Transportation Act. We ask only that you join us in this commitment.

I really want to thank you for the opportunity to be with you this morning. I look forward to working together with you and our Representatives in the Congress and others who likewise share the view that transportation is something that enhances our quality of life internationally.

Thank you very much for the opportunity to be with you.

Mr. MINETA. Thank you very much, Governor, for your very fine statement.

I know that with the Senate delegation that we have, as well as the Members in the House, who have worked very hard on behalf of the Commonwealth, these kinds of interests will be addressed.

Governor, the Committee on Public Works and Transportation, led by Congressman Anderson of California and Congressman John Paul Hammerschmidt, the ranking Republican from Arkansas, and Congressman Shuster, the ranking Republican on this subcommittee, and I join you in talking about the kinds of programs that we really need for the future.

I personally join you in your request for increases in the Highway Trust Fund obligation ceiling as a means to draw down against those Trust Fund balances. But I'm wondering, would the Commonwealth of Virginia support higher obligation limits than $15 billion, which might require an increase in the Federal motor fuels excise taxes to sustain higher Trust Fund expenditures?

Governor WILDER. As you know, the Governors signed on, and I did, to ask that the $15 billion be the ceiling without saying that that would be the limit, but increasing it from $12.2 billion. One of the problems that I have right now is that even if we would increase the excise tax, that very easily would be passed on to the motoring public.

That being the case, as long as that Trust Fund is held inviolate, so much so that the motoring public never gets it, it would be awfully difficult for us to talk about increasing gasoline taxes anywhere until the taxpayers could see the direct result of their monies.

Mr. MINETA. I'm aware of that. I think that's what we're trying to do, and that's to make sure that we draw down against the existing surpluses before we go back to them and impose additional taxes.

The recently-released National Transportation Strategy calls for "innovative approaches for funding State and local transportation programs." The committee is very well aware of some of the initia-

tives that the Commonwealth of Virginia has undertaken to finance her own transportation needs.

In addition to the public/private sector partnership for the construction of toll facilities, are there any other public/private partnerships being developed to address some of the transportation needs in your State?

Governor WILDER. As you know, we have Special Tax Districts being set up. One of them is on Route 28, along the corridor. One of the things that Virginia had to do—well, they did just this year, legislatively—was to say to those persons who had addressed proffers in that corridor, that those interests would be protected. That was done legislatively.

I would imagine that one of the concerns that we would have in our State, likewise, is that we have for the first time initiated pledge bonds, for which we would change our Constitution so that they could be used for transportation purposes. It passed the Legislature last year and it passed this year, and it should be put on the ballot this fall.

We feel that that would be something that would enhance further public/private sector involvement, to be in a position to determine where debt service payments would come from.

Mr. MINETA. The committee received testimony earlier today on a request of some $95 million in Federal funds, to be allocated for a demonstration project to conduct research for what is known as the Intelligent Vehicle Highway System, in conjunction with Virginia Polytechnic Institute and State University. The remaining cost of the project would be provided from State and local government and industry funds.

I am wondering if you are familiar—well, you are familiar with it since you mentioned it in your statement. How much does the Commonwealth of Virginia propose to provide for this research project?

Governor WILDER. We have conceptually embraced all of these projects that have been spoken to—the Roanoke River, the Coleman Bridge, as well as the so-called smart highway, in terms of that incentive. I would like very much to have the flexibility on behalf of the State to determine how and when those projects would come into being. As you know, in terms of whether any one of them is directly funded—in this instance, through this commission or through the Congress—we would obviously be matching as we are required so to do. The flexibility, however, would be something that I would desire to have, even though these are all worthwhile projects which would have been embraced. But in terms of dollar amounts and dollar figures, we are not prepared to say at this time.

Mr. MINETA. Very well.

Mr. Shuster?

Mr. SHUSTER. Thank you very much.

I certainly appreciate your testimony today, Governor. Virginia surely is extremely well represented on Capitol Hill by Senator Warner, who is not only highly respected but is one of the most powerful voices in the Congress on transportation issues as well as other issues. So you are in good stead with the Congressional dele-

gation that you have here, looking out for the Commonwealth's interests.

I notice you say there should be weighted funding distribution formulas to account for the greater costs associated with building in congested areas. On the other hand, we have many more miles in the rural areas, and rural areas have smaller tax bases. So shouldn't there be an equal, or at least some consideration given to, balancing these relationships rather than giving the greater weight to the urban areas?

Governor WILDER. Well, I think the equity should be there, I agree with you. One of the problems we have in Virginia is acquisition of right-of-way. Living in this area or being in this area, you are well aware of what land costs and what property costs in this area.

But I think to the extent that some consideration would be given, whether it is weighted or equitable, I would agree.

Mr. SHUSTER. You referred to the creation of Special Tax Districts, along the Route 28 corridor, for example, a special levy on commercial and industrial property. How is that working out? And is that not part of the solution to balancing these high costs in urban areas?

Governor WILDER. I think it has worked well. It has funded Route 28, for that matter, with 80 percent of the costs being borne by the private sector and the State putting up the start-up design funds, which would be recouped as a result of the assessments as they would come in.

One of the problems that we had, as I indicated, was whether those proffers would be vested. The Legislature, just this session, has balanced that equity so much as to say that those decisions made in that regard would be protected.

To the extent that that could continue, it could be held as a pilot. I am very appreciative of the fact that Secretary Skinner has hailed that, as well as other persons, by saying that it could be something that other States could emulate. We would like to use it in other areas of our State, and to the extent that this can remain successful, we encourage it.

Mr. SHUSTER. Thank you very much.

Senator WARNER. Mr. Shuster, could I amplify on that?

The Governor properly said that this was a key and pioneer type of legislation, but since there is a very substantial contribution from the private sector, in turn the private sector has got to receive some type of guarantees, possibly Federal and State, to protect that investment. That means that they predicate the use to which they are going to put their property as the basis for a very substantial contribution of dollars, and therefore that use cannot be taken away from them. Otherwise, it just undermines the concept and also makes it difficult, if not impossible, to live up to their contribution of private sector dollars.

Governor WILDER. One of the further problems, Mr. Shuster, is that you have to have density in the area to permit those private landowners the opportunity to make the proffer where it could be helpful to the motoring public. It's a rare thing to find the combination of density and ownership and State interest combined.

Mr. SHUSTER. Thank you very much.

32-253 O—91——20

Mr. MINETA. Mr. Payne?

Mr. PAYNE. Thank you very much, Mr. Chairman.

I simply want to thank Senator Warner, our fine Senator, for being here today on this occasion, and Secretary Milliken—this is his first day on the job, and I want to thank him for being here today on his first day, and especially Governor Wilder for a very comprehensive and clear view of the needs and the achievements of the Commonwealth of Virginia.

While I think the comments were directly about the Commonwealth of Virginia, they really relate to many things going on across our country and will be very useful to us as we go about our reauthorization process.

Thank you very much for being here, and I certainly support all efforts to get our Trust Funds, the Highway Trust Fund and the Aviation Trust Fund, off budget.

Mr. MINETA. Mr. Hancock?

Mr. HANCOCK. No questions, Mr. Chairman.

Mr. MINETA. Mr. Olin?

Mr. OLIN. Thank you, Mr. Chairman. I just wanted to thank you for the privilege of sitting with the committee, and to welcome again John Warner, my good friend. He has been here many, many times before, helping out on projects that are important to the country and to the Commonwealth.

I want to say hello to John Milliken. John, I think it's a great way to spend your first day on the job.

And to my good friend, the Governor, I want to congratulate you on a very forthright statement, a broad-ranging statement that, as L.F. said, is going to mean a lot to us in our deliberations. Nice to have you here.

Governor WILDER. Thank you.

Mr. MINETA. Governor, let me thank you again for your being before us today. We have many allies within the National Governors Association. Your predecessor, as the head of the National Governors Association, undertook a very major role in the whole issue of infrastructure.

The National Governors Association, I think, carries that stamp of wanting to come up with a very good program. I've had conversations with Governor Orr on this issue. She also brings a very strong rural orientation to it in terms of what has to be done.

But I think that out of this process that Secretary Skinner has started in terms of the 146 public hearings that he held across the country in coming up with this National Transportation Strategy, I think we have a very good start. I think all of us working together will come up with a very good bill that we will have on the President's desk and signed into law prior to the expiration of the present law on the 30th of September, 1991. I know that with the strong support of Senator Warner and others we will be able to do that.

So again, I thank you for your presence here today. I know that we are all familiar with your fine Secretary of Transportation, John Milliken. He used to walk the halls here when he was with Congressman Joe Fisher, as Congressman Payne said, so we look forward to working with him as well as we develop this national transportation legislation.

Thank you very, very much.

Governor WILDER. Thank you, Mr. Chairman.

Senator WARNER. Thank you, Chairman Mineta and Congressman Shuster and members of the committee.

[Governor Wilder's prepared statement appears on page 978.]

Mr. MINETA. At this time the subcommittee will stand in recess until 1:30. We will then have an opportunity to start off with our very fine friend, Tom Donohue.

[Whereupon, at 12:21 p.m., the subcommittee recessed, to reconvene at 1:30 p.m. this same day.]

AFTERNOON SESSION

Mr. MINETA. The Subcommittee on Surface Transportation will please come to order.

At this time I would like to ask Thomas J. Donohue, the President and Chief Executive Officer of the American Trucking Associations, to please come forward.

Mr. Donohue, your complete statement is before us. It will be made a part of the record, so you may go ahead and proceed in your own fashion, sir.

TESTIMONY OF THOMAS J. DONOHUE, PRESIDENT AND CHIEF EXECUTIVE OFFICER, AMERICAN TRUCKING ASSOCIATIONS, INC.

Mr. DONOHUE. Thank you very much, Mr. Chairman.

I would like to begin for just a moment by talking about the American trucking industry.

In 1988, truckers collected almost a quarter of a trillion dollars, $240 billion, to move freight across this country. It was accomplished by approximately 200,000 companies employing 7.5 million Americans. Trucks make up 5 percent of this Nation's gross national product and move 77 percent of the value of everything America grows and produces.

Just for comparison, waterways move about $20 billion; railroads move about $30 billion; and the airlines, if you include all of their passenger and freight, generate in the high $50 billions. So as you can see, trucking is between five and ten times the size of all the other modes.

It is another interesting fact that truckers pay over $50 million a day in highway use taxes, nearly 50 percent of all the taxes paid into the highway account of the Highway Trust Fund and the States.

Now, let me talk just for a moment about highways. America's transportation system is one of the basic elements that leds this country to the industrial pre-eminence. It is also our transportation systems that will provide—as you said this morning, Mr. Shuster—a rejuvenation of this economy in the years to come. History tells us that all transportation systems have a core element. In the past we started with beasts of burden, then boats on canals, followed by railroads; but today trucks are the core transportation systems for the movement of freight in this country.

America's industry has significantly reduced its cost of operation by managing its raw materials and its finished products in such a way that the movement of the product from mill to assembly plant

is carried and stored on a truck. It is the warehouse of choice, and the use of "just in time" inventory has significantly reduced the cost of producing products in this country.

Clearly investments in good highways mean good business for American's businesses. A strong Federal highway system is a must as it is the key element in meeting this Nation's highway needs. I would add parenthetically, that the U.S. is competitive worldwide in part because of our logistics system. We have the most efficient logistics system in the world. If we had logistics systems like some of our trading partners, our competitive ability would be significantly reduced.

Mr. Chairman, let me go forward now to make a few comments about the plan or the analysis that was recently released by the Department of Transportation and Secretary Skinner.

Unlike many of the people and organizations that have been heard in the press, ATA thinks that what came forth from the Transportation Department was an excellent first step. For the first time in recent history, transportation is on the front page of every newspaper and television in this country, and the Secretary succeeded in setting out a sheet of music by which everyone danced to provide their views, their concerns, and their hopes for the future.

Obviously, the trucking business saw a lot of things in that plan that it liked, and we saw a few things that we are concerned about. We are very much in support of the consensus that we must now rebuild, repair, and expand our Nation's principal highway network. A Highway System of National Significance, the road network of 150,000 or 160,000, is a must for us, and we very much encourage your attention to it in the development of the new highway bill.

Expanding this national system can best be done, Mr. Chairman, if we move to a higher standard of construction and design. I have been told by some people that work for us—Clyde Woodle was one of them and this committee knows very well how able he is—that if we added one inch of pavement to the new roads we build, we would get twice the wear. And an inch of pavement adds less than 1 percent to the total construction cost of the road.

The money in the Trust Fund is a great place to start with a new construction program. No new taxes are needed initially to significantly increase the amount of money that we put into building America's highways. Continued Federal funding for major secondary and urban road projects and for bridges is also needed. This industry recognizes that if we begin to spend that money now, at a later time there will be a need for additional dollars.

We support the Administration's efforts to advance the adoption of the IRP and the IFTA. We think these programs would significantly reduce the complexity and the paperwork in our business. We support better highway management to relieve congestion because we are aware that in the 1990s, the Siamese twins are going to be congestion and pollution.

We also support the work that has been suggested in research and the need to do something about overweight containers and, in fact, overweight trucks on the road. That's going to take some effort by this committee and others to deal with the shippers to be

sure that there is joint and several responsibility to be sure that trucks are not overloaded.

Let me just say a word about a few of the things that concern us: tolls, tolls, tolls. We are concerned that we do not put tolls on roads that we have already paid for or on roads that we're in the process of paying for. Clearly, there are places where tolls play an important role, and we are prepared to debate that issue, but we don't think that we should pay twice for the same road.

We are concerned about expansion of the use of Highway Trust Fund dollars for purposes other than highways. There is a whole list of them and I need not repeat them.

However, we are concerned about shifting a greater, burden of highway construction costs to States and local governments, because this could mean a hidden and back door means of taxation. While the Administration says "Watch my lips," it occasionally encourage someone else to do its work.

Finally, we are concerned about the matching ratios. We think that a good deal of discussion needs to come forward there.

I would mention for those interested in revenue that there is probably still $1 billion in excises tax evasion. A stronger effort to collect those taxes at the highest level possible in the distribution system would be in everyone's interest.

We also oppose gasohol exemptions. I understand we want to avoid exemptions, but at the other hand we need votes for highways. However, we are very much opposed to further exemptions from the Highway Trust Fund taxes.

Let me wrap up, Mr. Chairman, by saying that although we are very, very positive about Secretary Skinner's plan, we understand that the Administration and DOT propose, but this committee and the other committees of the Congress are going to dispose of whatever it is that they have proposed. We look forward to working with you on that.

The trucking industry in this country is 10 percent of the traffic and we pay 50 percent of the taxes, so you can be sure that we want to be a major player in passing a highway bill, as the chairman indicated, within the time prescribed. We want a highway bill that supports our economy, supports our quality of life and our freedom of mobility, supports our world trading position, and supports our national defense. You can count on us to be strong supporters of your efforts in the months ahead.

Thank you very much, sir.

Mr. MINETA. Thank you very much, Mr. Donohue, for your very complete statement. I always appreciate the thoroughness and the professionalism with which you and your staff approach issues.

Mr. [illegible] Thank you, sir.

Mr. [illegible] I commend you on that and ask that you convey that to your staff, as well.

Tom, there is a continuing need for a Federal role in preserving the Nation's interstate and primary highways. You are well aware of AASHTO 2020 and their report that recommends the proposal of the development of a category of highways to be known as the "Highways of National Significance."

Do you believe that establishing a higher Federal-aid matching ratio for the category of Highways of National Significance would bias the States' priorities for the use of Federal funds?

Mr. DONOHUE. Mr. Chairman, the spirit of the study and of some of the discussions that have taken place here is that the States clearly should have more flexibility in determining how they will spend some of the money. After all, the Governor was here today, and he's the one who has to deal with some of the very difficult decisions, particularly within the larger cities.

On the other hand, the national system that we have and that we envision for the future is not the connection of 48 contiguous States' decisions. It is a system designed with the well-being of the total Nation and the total economy in mind. For that reason there have to be stimuli that put a little more concern, a little more attention, and a little more determination behind a national system. I think the chairman and the members of the committee recognize, and will probably move in such a way, that they must allocate the funds to insure that we can get from place to place on roads that connect the Nation's economy.

One of the reasons Eastern Europe and the Soviet Bloc are having a terrible and difficult time in providing the basic commodities of life to their citizens, is the lack of roads. Now, there are military and political reasons they don't have them, but 30 to 40 percent of the food in the Soviet Union rots before it ever gets to the market.

I would encourage the chairman and the members, in putting together the highway bill, to go forward and use the money in such a way as to be sure that we have a national system that we can count on.

Mr. MINETA. In that regard, the National Defense Interstate Highway System connected metropolitan areas so that you were able to go from community A to community B. One of the things that we maybe didn't do was to make sure that once you got to community B you were able to get around within that metropolitan area.

One of the things I think we want to do in this bill is to try and build that flexibility that would allow local and State decision-makers to be able to say, "Yes, this is what we need in our local areas." But that means that we also should have some kind of a strong metropolitan planning organization.

Have you given any thought as to how that part of it might be addressed?

Mr. DONOHUE. Mr. Chairman, as you alluded to, the rules have all changed. When this was done in President Eisenhower's time, we simply had to put roads from one big city to the other. Here in the Nation's capital we built a beltway around the capital so that people could bypass the capital. Did anyone envision then that we would have a population that was coming to work now on those roads or the use that that road would have? No. What we need to do is give the people on the scene sufficient flexibility, not only in highway funds but also in the use of mass transit funds. I don't like the word "commingled," but there needs to be some flexibility, that the administration of not only one jurisdiction but also sur-

rounding jurisdictions can get together and do things that make sense.

Sometimes we are so specific in the outlines of what is allowed and what is not allowed that we eliminate the only thing that really ought to be allowed: common sense.

The very distinguished Governor of Virginia has some serious problems he has to address, and having some flexibility in what he does with the money is important. But there are things I wouldn't want him doing with the money, but in his purview of highways, it would be fine to have a little flexibility.

Mr. MINETA. Now, the Strategic Highway Research Program is conducting a long-term pavement performance program to enhance the efficiency of the physical highway structure.

What significant benefits would be derived from implementing some of the interim findings from this proposed 20-year ongoing research program? Would the benefits accrued primarily enhance the productivity of the trucking industry?

Mr. DONOHUE. Well, Mr. Chairman, it costs us a fortune today operating on roads that are not well maintained. The average tractor-trailer gets somewhere between five and six miles per gallon. If you run it on a good road, it's up around six and a little better, and if you run it on a really bad road, it's down around four. When you run 250 billion miles a year, that's getting to be real money.

Not only that, but poor roads are very unsafe. They encourage vehicle problems and driver problems, such as fatigue. For example, some of the research suggests that one way to make highways safer is to make off ramps of better design. Unfortunately some of the States are still building highways with 1935 technology. Not many, but we really must use some of these research findings to make roads safer, more durable, and less expensive.

We are in a time of technological change where we will never get to the end. We will never finish a study, we will never finish a program. But we will know more before we get there. So we ought to take whatever knowledge we gain and use it, because there are crying needs across this country to fix the highways to maintain our mobility.

Mr. MINETA. The committee has received testimony supporting higher Federal expenditures for the Federal-aid Highway Program. Again, in their report AASHTO has proposed that the Federal Highway Program be funded at a level of $17.5 billion in fiscal year 1992, increasing to $26 billion in fiscal year 1995.

A significant increase in the authorization of the Federal-aid Highway Program to that level would require two things. One, of course, is a draw-down against what is in the Trust Fund now, but I think that will also trigger a need for an increase in excise taxes.

On that score, I am wondering under what conditions the ATA would support higher excise taxes.

Mr. DONOHUE. Well, Mr. Chairman, as you know, we have been the major opponents of plans to use excise taxes to reduce the Federal deficit or clean the air. We are already going to have to spend, as you know, $0.03 to $0.05 per gallon before 1994 to clean up diesel. But we have opposed increases in excise taxes because we believe that it is regressive and unfair and breaks the covenant with the Highway Trust Fund.

But if the highway reauthorization had us drawing down the Trust Fund money by spending it at the rate that you described, the trucking industry would be prepared at the end of two, three, four years, whenever it was drawn down to step up and support an increase in excise taxes to ensure a continuation of highway spending at that level. Not only would we be willing to do it, but also we would support the committee in getting the Congress authorization for that tax.

Mr. MINETA. The National Transportation Policy supports the use of Federal funds and toll revenues for the construction of toll facilities. Such a policy would provide for the construction of highways to relieve congestion of these Government-financed highways.

Would the imposition of tolls on a network of Highways of National Significance affect the productivity of the trucking industry?

Mr. DONOHUE. Well, Mr. Chairman, if we pay $50 million a day in taxes and we start paying it a second time, it is certainly going to affect an industry whose profit level was slightly more than 2 percent last year. We are in a serious problem. Fuel prices went up, which further reduced profit margins. In our judgment, to pay twice for the same road is not only a mistake, but a little dishonest.

On the other hand, there are places where tolls make sense. There are roads that are not yet paid for and maybe cannot be paid for very easily with Federal or State funds. Perhaps we ought to have a private involvement or an agreement among the State and the users of the roads on a bond issue and tolls. But once paid for, we ought to get rid of it. We have a situation in Ohio where the Ohio Turnpike is paid for, but now everybody finds 12 reasons to keep the tolls.

I should say that as much as we would vigorously support the chairman's effort to increase the excise taxes at the appropriate time, you might find us in some opposition to inappropriate use of tolls.

Mr. MINETA. Over the last few weeks the committee has been informed that the trucking industry is proposing a provision to require States to allow the operation of 48-foot trailers or other longer combination vehicles on the national truck network. Does ATA support the use of longer combination vehicles as a means to enhance productivity within the trucking industry?

Mr. DONOHUE. The answer to that question, Mr. Chairman, we don't want any mandate for those types of trucks, right now. Those decisions very much have to be left to the States' option, where the circumstances of the roads, the geography, the economics, and the business demand can be seen in a local area.

But there are some other points to consider. First of all, we are all concerned about clean air. We are concerned about a massive driver shortage. We are concerned about fuel consumption. By occasionally using larger trucks or combinations of trucks which have very good safety records because of the professional drivers and the way they are used, maybe we can meet some of these other public policy objectives.

We're not going to ask those to be mandated in the Federal highway bill authorization. However, we hope we can work with the members and the Governors and others to get them where they make sense.

I might say, if I can, a little bit tongue-in-cheek, I hope that in this highway bill we can get what we were promised in the STAA, which is 48-foot long, 102-inch wide trailers in all the States. We still have a handful of States where the Mickey Mouse rule is the order of the day in terms of how they deal with 48–102's. I told one Governor not long ago that I think in about another year he ought to block 48's from his State. He said, "Why?" And I said, "Because we won't have any 45's left by then." It was a long time ago that we were promised access and we still don't have it everywhere that we ought to have it.

Mr. MINETA. Thank you very much, Mr. Donohue.

Mr. Shuster.

Mr. SHUSTER. Thank you.

As always, Mr. Donohue, we certainly appreciate your very perceptive and well thought out testimony.

I was interested in your comment that trucks pay 50 percent of the taxes and represent 10 percent of the traffic on the highways. Some years ago, the figure that sticks in my mind for that relationship was that trucks represented 16 or 17 percent of the traffic and paid 46 percent of the taxes. I am intrigued by the change in those statistics, but to what extent does that represent heavy trucks versus light trucks when you talk about 10 percent of the traffic? How much of that is heavy trucks?

Mr. DONOHUE. First let me speak to the taxes. You can get anybody's number, Mr. Shuster, from 45 percent on up, and it really depends on all the trucks that are included and all the taxes that are included, but it's a significant number.

The 10 percent of the traffic basically includes trucks that are in the commercial business. Before I give you a wrong answer, I think what I would do just to get it exactly right, because there are a lot of people here who are a lot smarter than I am, I am going to ask somebody that question, if you would just take one second.

Mr. SHUSTER. Sure.

What I'm really looking for here is the percentage of heavy trucks and what percent of the tax they pay.

Mr. DONOHUE. It includes all the commercial trucks. So if you were to say, what percentage of the heavy trucks, it would be significantly less than that. It would be down probably to half of that. Today there are five million trucks, in round numbers, and about 1.5 million to 1.7 million of those are heavy combination vehicles. Then there are the fairly heavy straight trucks, and then you get down to all the delivery trucks and so on. So if it's 10 percent of the total traffic, probably less than 5 percent are heavy trucks.

Mr. SHUSTER. And I wonder what percent of the total taxes those 5 percent pay?

Mr. DONOHUE. That's where a large amount of the money is.

Mr. SHUSTER. I would think so.

Mr. DONOHUE. I tell you what I will do, Mr. Shuster, I will get one page, very simple, that lays that right out.

Mr. SHUSTER. I can see your staff leaning forward.

[Pause.]

Mr. DONOHUE. That lady knows every number in this business. Heavy trucks pay 30 percent of it.

Mr. SHUSTER. Okay, and represent about 5 percent of the traffic?

Mr. DONOHUE. That's right, or a little less, and they are paying 30 percent of the taxes.

Just the same, because that is an excellent question, I would like to send over one sheet and have it included in the record because we have just been going through those numbers.

[The figures referred to follow:]

AMERICAN TRUCKING ASSOCIATIONS, INC.

THOMAS J. DONOHUE
PRESIDENT AND
CHIEF EXECUTIVE OFFICER

2200 MILL ROAD
ALEXANDRIA, VIRGINIA 22314
(703) 838-1800

April 5, 1990

The Honorable Bud Shuster
Surface Transportation Subcommittee
Public Works and Transportation Committee
2165 Rayburn House Office Building
Washington, D.C. 20515

Dear Mr. ~~Shuster~~: Bud

It was a pleasure to testify before you on the critical issue of the future of the highway program. In response to your question regarding the relative tax payments and travel of larger vehicles, all combination vehicles pay 33% of Federal highway user taxes, travel 4.5% of vehicle miles and represent only 0.8% of all vehicles registered in the Nation. The figure included in my testimony of March 15 indicating that "commercial trucks" pay 42% of Federal taxes is based on combinations and larger single unit trucks combined. These vehicles pay more than 42% of Federal taxes, travel 6.9% of all vehicle miles while representing only 2.9% of all vehicles registered.

Thank you again for the opportunity to present the views of the trucking industry. I look forward to working with you and your colleagues on this important issue.

Sincerely,

Tom

/ts

See You Soon!

Mr. DONOHUE. You know, one of the problems we have, Mr. Shuster, is that there is no single trucking business. There are probably eight or ten or twelve different businesses, very, very different, within the trucking industry. We have been working hard to get more and more information about our business. It is a complicated thing to gather, and I look forward to giving you some of that material.

Mr. SHUSTER. Thank you.

What do you consider the biggest safety problem facing the trucking industry today?

Mr. DONOHUE. The trucking industry in the last five years has done more about safety than any industry in this country, in my judgment. The first and most important thing we did, with your help, was pass the Single National Driver's License legislation. The single most important safety problem we face today is getting that legislation adopted, applied, and implemented around this country. Once that's done, those people who drink and drive, speed, drive recklessly, and have accidents, are not going to have anywhere to hide.

But there are lots of excuses—some of them valid—as to why the license is not in this State or that State. But, you know, this is a simple issue. This is an issue of getting a simple computer system and keeping track of the people who drive heavy trucks in this country. If we take care of that, you can be absolutely sure there's going to be an improvement in safety, more safety consciousness on our highways than we have had in the history of trucking.

Mr. SHUSTER. With regard to pollution, it appears that Congress is going to enact clean air legislation this year, and that some in your industry are going to be required to convert to alternative fuels.

What would you see the impact of this being?

Mr. DONOHUE. Well, Congressman, to ignore alternative fuels is to be the ostrich and stick your head in the sand. We are a Nation and an industry dependent on other people's oil. But on the other hand, to jump at untried technology is a folly. There was a period of time over the last year when there were a lot of people running around this country talking about methanol. Do you know what methanol is? Methanol is what they use at the Indianapolis 500. It's explosive, corrosive, flammable and water soluble. You drop it on the ground and it goes into the water table. You bring a truck inside in the cold weather to repair it, and it goes up into the lights and blows up.

So when you say "alternate fuel," which fuel? And how much fuel is it going to take to make that fuel? I'm sure you've read the stories in recent months about what has happened in Brazil, where they were going on an ethanol standard, and now it is consuming all their crops. They've got all sorts of incentives and its distorted their tax base.

We need to do what's smart—smart science and very smart politics—before mandating that which we're not sure works. But this industry won't stick its head in the ground. For example, we are going to spend $0.03 to $0.05 per gallon as I indicated before, to clean up the diesel fuel and make changes in the engines with significant costs—because we're going to meet the EPA's 1994 clean

air standards. What we don't want is for somebody with a bright idea tell us, "Well, you'll use this alternate fuel, or that alternate fuel." If we use methanol or ethanol, you're going to need twice the amount of fuel. How are you going to fuel those trucks? Where are you going to keep it?

I'm very concerned about alternative fuels, but we'll be on the front line of working with them. We are doing some studies in our own Foundation to find ways to get alternate fuels that work. We hope we can work with your committee and in turn you will protect us from people with bright ideas.

Mr. SHUSTER. One final question. You have suggested that Federal funding go from $1.8 million to $50 million for truck-related research. That's an enormous increase. Do you think we could spend that money wisely?

Mr. DONOHUE. Yes, but let me give you answers. Look at the other modes, where the government is spending $17 million plus the State money, and on the railroads significantly more than that. Remember the railroads do 10 percent of the business that we do and employ some 300,000-odd people, whereas we employ 7.5 million people. You're talking about truck-trailer research. You're talking about driver research, fatigue, wellness, safety. You're talking about communications technology. You're talking about tax policy. Further you've got 50 States that have a demand to do some research. So $50 million worth of research in this industry, carefully used, will repay us time and time again with the type of information that will enable us to save billions of dollars.

We can easily spend it. We are an industry 10 times the size of others that have research budgets of almost $25 million.

Mr. SHUSTER. Thank you very much.

Mr. MINETA. Thank you.

Mr. Hastert?

Mr. HASTERT. Thank you, Mr. Chairman.

Mr. Donohue, we certainly appreciate your coming before us today.

Mr. DONOHUE. Thank you.

Mr. HASTERT. It is interesting that in the debate, certainly within this committee and it has been a traditional debate in this committee, it has been the Trust Fund and why we accumulate literally tens of billions of dollars to shade a deficit that everybody knows is there anyway, and those dollars really ought to be spent out.

Some of the proposals I hear are for increases in gas taxes and other types of taxes to defray that deficit. If we doubled the gas tax in this country to defray the deficit, what would be the cost to your industry and what would be the competitive disadvantage that you would see?

Mr. DONOHUE. After personnel, diesel fuel and gasoline are our biggest expenses. If you doubled the gas tax in this country right now, our industry would run at a net loss. We wouldn't have any profits across the industry because it would take some time to pass that on to the customers. The way the pricing mechanism works in the trucking business, there is a very long holding time, then when it finally got to the customers there would be an unfair, regressive, and disproportionate application of that tax.

It is wrong to ask one or two or three industries to pay for everybody else's deficit. It is wrong to ask people in Wyoming to pay an expanded portion of the deficit because they drive long miles. It is wrong to charge the people least able to pay for that deficit. It would be terrible for the industry and would be terrible for the country. It would cost us thousands of jobs. It would increase inflation, and we ought not do it.

However, if you took some portion of that at the appropriate date after you had spent down some money in the Trust Fund and put it into building highways, it would create jobs; it would create commerce; it would reduce inflation over time, and it would be good for us.

But you will find us the strongest opponents of a fuel tax if it does not go into building highways.

Mr. HASTERT. So what we would do is end up passing a pass-through. The increase would go eventually to the shipper and then the consumer.

Mr. DONOHUE. But between "now" and "eventually" there would be an absolute trauma in the trucking industry.

Mr. HASTERT. I tend to agree, and I think you're probably preaching to the choir here——

Mr. DONOHUE. Well, we're both getting it on the record here. Any time I get a chance, I want to do it.

Mr. HASTERT. One of the things that we look at, and you have it in your testimony, you talk about intermodal freight. Really, as we have to become more and more competitive on the international scene—you know, trucks used to be a domestic thing. Today they aren't. They haul the containers. With the "just in time" philosophy, they are the mechanism to get the containers to the factories and to the assembly lines just in time.

Do you think that Federal highway funds or those Trust Fund dollars should go toward modernizing our intermodal facilities as well as the cement and bridges and roads?

Mr. DONOHUE. Well, first let me say that intermodalism is the thing of the future. Shippers don't care how you get it there, sir. They want it there safe, efficiently, quickly. It is in our interest—both railroads, water, air, trucks—to work together to provide that service.

To do that, we're going to have to learn how to cooperate with one another so that we can learn to compete with one another more effectively. Cooperation means that we're going to have to have sizes that we agree upon and standards that we agree to for containers and weights. By the way, that's one of our biggest problems, because as containers come into or out of the United States, they are grossly overweight. The first time the trucker knows it is overweight is when the front wheels go off the ground.

But the circumstance that you asked, should we take Federal highway money and should we build roads to the airport or to the rail link and so on, well, some of that can be done, I think, as we were discussing about what we are going to do with the money if we give the discretion to the local communities and the Governors. You have to be very careful in dealing with that because we do have serious airport problems and we do have a lot of money in the Aviation Trust Fund. We do have the railroads trying to be very

competitive, and I'd like them to be as competitive as they can be with their money. You know they had an 8 percent profit margin this year.

We are open to ideas that are good for business and good for our industry. We just don't want to leave the door all the way open without anybody watching it.

Mr. HASTERT. Well, I agree. In your opening statement you talked about the real basis of the economy, how you can move goods, and if you can't move goods and be efficient and be competitive, then we're out of the ball game. So I tend to agree with you on that.

You touched on the weight of the containers——

Mr. DONOHUE. A very serious problem.

Mr. HASTERT [continuing]. And how the shippers ought to be responsible for that. Can you do that practically?

Mr. DONOHUE. First of all, you certainly can. Let me just tell you two facts. We have to be honest with ourselves because we like to give great speeches and say that 30 percent of the containers that come into the United States are overweight, but 30 percent of the containers going out of the United States are overweight. Now, why are they overweight? And what does overweight mean? If it's overweight a couple of pounds because it filled out the bulk, who cares? But when you're 5,000, 10,000, 25,000 pounds overweight when it says "television parts from Taiwan" and it really is nuts and bolts, and you put it down on the trailer and the front wheels literally come up a little bit off the ground, that's a little out of order.

Do you know what we're doing? We're hurting ourselves competitively, because they don't pay by weight on those ships. They pay by cube, per container. The railroads have the same problem. If they don't know what the container weighs and they put the heavy one on the top, it leads to turnovers and derailments and so on.

So I think we just have to say that we're serious about our trading regulations. Why do we want the Heiniken Beer people to set the trading rules? Let's us set them. We're our own worst enemy, because the ports all up and down the eastern seaboard and on the western coast are increasing the weights they will take to get the business. Ports are competing with one another. But the poor trucker, who is allowed to take that container north and south on the permit but has to take it east and west, is the one who gets the ticket. He's the one that has the accident. He is the one that runs into my kids or yours.

We've just got to get tough about that. The same thing ought to apply in the United States. There can always be an accident, but if a shipper intentionally overloads a truck or overloads a trailer, he ought to share the liability for that in terms of the accident, in terms of the ticket, in terms of whatever legal recourse should be there.

How can they walk away from it and say, "I'm Pontius Pilate, that's not my problem"? They know when they're overloading a truck.

You just hit one of my hot buttons.

Mr. HASTERT. I noticed. [Laughter.]

Mr. MINETA. Would my colleague yield on that, if I could follow up?

Mr. HASTERT. Yes.

Mr. MINETA. So who should we put the heat on? The shipper? The carrier? The trucker? Whomever? The consignee?

Mr. DONOHUE. Yes.

Mr. MINETA. Is it the shipper in Bangkok? Is it the consignee in Detroit? Is it American President Lines? Is it——

Mr. DONOHUE. Let's take an example. Let's just take those coming into the United States.

The technology now allows that a piece of tape and wire on the cable that picks up the container weighs it within a pound. It's electronic weighing. If they are grossly overweight—I don't want to split hairs about a few pounds here and there—if they are grossly overweight, we put them on the side and we call the guy who sent it in Taiwan and we say, "You have three choices: One, you can come get it. Or you can pay us an extra fee, and tonight we'll move it on a trailer that is designed to carry the heavier weight, because the gross weight is not as important as axle weights. Or finally we can arrange for the ILA, or whoever happens to be running that port, to take that container apart and put it in two containers, and we will charge you to move two containers."

Now, I know that sounds terrible, and people will say, "Well, we'll hold up the freight coming into the United States." Those are products that are competing with American manufacturers. Why should we let them move them at reduced price?

In terms of going out of this country or going around this country, I think we should say that the trucker should do everything he can to not pick up overweight loads. But, you know, I want to tell you about what happens to small trucking companies. Remember, 96 percent of the companies in this country have six or fewer trucks, and it's a tough time when somebody says, "Mr. Mineta, you take that overweight truck or you forget it, because the guy right next to you will take it." And in that situation, when we stop a truck on the Pennsylvania Turnpike and he's 30,000 pounds overweight, the shipper who loaded that container or that truck should share in that responsibility. They can't just say, "The minute you pull away from my dock—and I know I overloaded it—it's your responsibility, trucker."

In the insurance business and the legal business, joint and several liability has brought people to look at circumstances a lot differently. If we have joint and several responsibility, the shipper will find it in his interest not to overload trucks, and truckers will feel a lot better about telling the shipper that they share the liability.

It's not an easy thing to do because we have millions of containers and millions of trucks every day, but it's something we ought to do. Otherwise, the few who abuse the process are hurting everyone else. And it's a safety issue. It is a very up-and-down safety issue and we have a responsibility to our fellow citizens.

I think that the DOT and the Congress can get together with the industry—the railroad industry has the same problem—and we'll help you figure out a way to do this thing that makes common sense without stopping the industry. As soon as the word goes out, it will happen.

I spoke to the National Industrial Transportation League about four years ago about this. I proposed it and they all screamed. I said, "Let me ask a question. Is there anyone in this room that intentionally overloads a truck?" Nobody put up their hand. So I said, "Then what are you worried about?" [Laughter.]

Mr. MINETA. I thank my colleague from Illinois.

Mr. HASTERT. Thank you, Mr. Chairman.

One of the things that you have here in your program—you didn't talk about, but it's written here—and I might add that I made an effort to go around and talk to a lot of my local truckers in my district about truck issues and the things that they're most concerned about, and the "one-stop shopping" thing is something that I hear over and over and over again.

Do you think that some type of legislation that would urge States to go into international agreements for both registration and taxation is something that would be helpful to your industry?

Mr. DONOHUE. I certainly do, Congressman. A lot of the States are moving forward on that, but a little friendly persuasion from the Federal Government would help.

Do you know that it would cost us well over a billion dollars in administrative costs to pay our taxes? Then imagine one of your truckers that runs in 12 States, and all of a sudden now he has all the stickers and license plates, and where is the truck—we're in the age of computers. We're in the age of simply doing this thing by electronic processing, make sure all the trucks are registered, send the money, distribute it around to the necessary parties. Why should we spend all that unnecessary money?

I think that if this committee and the Members of Congress could help us push that along in the States, that we would save the industry a great deal of money. We also would have a better sense of the information we need to know about trucks in this country and how we should best use them.

We're going to have some additional problems coming down the road. Now States are beginning to look at inventive taxation. At one point they wanted to tax truck drivers' income as they drove through the States, or trucking companies, or they're looking at all kinds of sales taxes. We need simplicity. The railroads have lots of protection for that, you know, and we'd like some of the same protection.

Mr. HASTERT. Well, there are some bills around that give you that protection.

Mr. DONOHUE. I understood that we were getting there. That's the next question, but that's all right. [Laughter.]

Mr. HASTERT. There's not going to be a next question.

I certainly appreciate your testimony.

Mr. DONOHUE. Okay. Well, that's fine.

Let me say, if you will allow me, I think the bill that you are talking about has a lot of very good things in it. It also addresses a very fundamental question in our industry. It is a difficult time. There is tremendous consolidation, mergers, acquisitions, and bankruptcies. We've had some excellent discussions in recent months with the shippers. We're beginning to see the economic issues there.

You know, for years the fellow in charge of the shipping business has run upstairs to tell the CEO how much money he has saved. I was out at one of the major automobile and truck manufacturers the other day, and he was telling me that truckers don't have any money to buy trucks. I said, "Do you know what your shipper guy told people the other day? That he saved $2.3 billion in the last six years in moving things on trucks." And we need to get a little balance here, and I'm sure we'll be able to, with the driver shortage and the things that come up, sort of balance this out. I think that a discussion on your bill is a healthy thing to do.

Mr. HASTERT. Thank you.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Donohue, let me ask this. The National Transportation Statement that was just issued supports expansive use of intermodalism to address the Nation's transportation demands. The policy also supports what you sort of gingerly referred to as "commingling" of transportation trust funds.

Does ATA support the flexible use of transportation trust funds?

Mr. DONOHUE. Mr. Chairman, if you are talking about, for example, the Federal Highway Trust Fund and the mass transit situation, giving the Governor of Pennsylvania and the Mayor of Philadelphia some flexibility to make choices that make common sense, sure. If you're talking about some of the comminglings that are suggested in terms of airports and rail situations, we need a lot of good judgment about that and there would have to be a lot of controls on any of that sort of thing.

But common sense is what we're interested in, and you're going to have a lot of support from us as long as what we're talking about fits that bill.

Mr. MINETA. You make a very strong case for the 55 mile per hour speed limit. Even if the speed limit is not returned to 55 for motor vehicles generally, do you believe that a 55 mile per hour speed limit should be required for trucks?

Mr. DONOHUE. Instinctively my answer to that, Mr. Chairman, is yes. But you know, one of the things we've learned in this country is that the speed limit is sort of the base number from which people accelerate. So if you have a 55 mile per hour speed limit, some people are driving 62; so if you had a 65 mile an hour speed limit for cars and they are driving 71, and trucks are driving 55—and a lot of them are governored at 57—I need to know some more about what happens with two speeds of traffic on highways. We're trying to do some studies about that. I don't know the answer on it, but my philosophical position is that trucks ought to drive as close to 55 as we can get them because the physics of the thing are very simple. You take an 80,000 pound truck going down the highway, it might be wet, and if you can cut 10 miles off the speed, safety takes hold a lot better. Not only that, but we use a lot less fuel.

Mr. MINETA. What is your current position on radar detectors?

Mr. DONOHUE. There are a number of different positions in the Donohue household on that matter. [Laughter.]

The position of the trucking industry is that we ought not have them because the only reason we would want to have them is that we would want to drive faster than the law allows. We don't want to break the law, and that's our policy. In fact, I have to get after

some of my staff when I get in their cars and they have them. I have three sons that are interested in the technology—simply for the experience, they tell me. [Laughter.]

Mr. MINETA. All right. Well, again let me thank you very, very much for your complete and thorough statement. I look forward to working with you as we continue developing this policy statement that we have now into legislation.

Mr. DONOHUE. Thank you very much, Mr. Chairman.

Mr. MINETA. Thank you very, very much.

[Mr. Donohue's prepared statement appears on page 798.]

Mr. MINETA. At this time I would like to call forward the Senior Vice President of the American Bus Association, Susan Perry.

Ms. Perry, we have your statement. It will be made a part of the record, and you may go ahead and proceed in your own fashion.

TESTIMONY OF SUSAN PERRY, SENIOR VICE PRESIDENT FOR GOVERNMENT RELATIONS, AMERICAN BUS ASSOCIATION

Ms. PERRY. Thank you, Mr. Chairman. For the record I am, as you say, Susan Perry, Senior Vice President for Government Relations of the American Bus Association. It is a pleasure to be here once again and to present the views of the Association, this time on the reauthorization and some thoughts that we have on the upcoming highway and transit programs.

My testimony today will cover a number of issues in several titles of the reauthorization legislation that you will be developing during the coming months. I am going to try to do this in five minutes. As you well know, I have never talked about anything in my life in only five minutes, but I will do it as quickly as I can.

By way of introduction and explanation of what the intercity bus industry is today and the position it is in, I would like to cite a report—and this is the entire report, done last year by Robert R. Nathan Associates here in Washington—entitled "Federal Subsidies for Passenger Transportation, 1960–1988: Winners, Losers, and Implications for the Future."

For the record, Mr. Chairman, I would like to submit just a copy of its executive summary.

Mr. MINETA. Without objection, so ordered.

Ms. PERRY. Thank you.

The report points out that while the intercity bus industry is indeed the primary carrier of the old, the young, the poor, and those in rural America, the industry has received only three-tenths of one percent—less than half of one percent—of the Federal transportation assistance over the last 28 years. When we refer to an unlevel playing field—which we do, as you are all aware, quite frequently—and we say that this must be rectified, this is what we mean.

Although we are not asking for direct Federal subsidies, we are indeed asking for Federal transportation policy that will maintain and revitalize the only intercity service that exists for those groups of travelers whom I have just mentioned.

To quote from the report, "Private bus operators have continued trying to serve as every community's link to neighboring urban centers, ensuring that affordable transportation would be available

to everyone. But now the cumulative impact of Federal neglect has begun to take its toll on the network of intercity bus transportation."

A Federal transportation policy that would include attention to the following would be most helpful to us: promotion of public/private partnerships; development of intermodal facilities, particularly transportation centers; equity of treatment, including looking at subsidies of competing intercity modes, such as Amtrak and the airlines; and finally, some infrastructure improvements, including high occupancy vehicle lanes.

I believe it is appropriate for me to address a few of these in a little more detail. First let's look at intermodal facilities.

These are a win/win experience for the private and the public sectors, as well as the traveling public. The recipient of Federal capital dollars builds the center and uses it for its operations. The private sector operator pays rent to use it as well, thus providing income to the owner and the builder, while receiving a new, safe, and clean facility for the private bus operator who doesn't at this time have the construction capital sufficient for its needs around the country.

The availability of Federal dollars for these transportation centers benefits the private intercity bus industry immensely, but it does not constitute a direct subsidy to it. In fact, by paying rent the industry is paying its own way and making a contribution to the operation of the center.

Secondly, infrastructure improvements—the one we're concerned with particularly today is high occupancy vehicle lanes. Unquestionably, HOV lanes are a highly cost-effective method of relieving urban congestion. We know that there is congestion in every urban area of the country, and because this is a nationwide problem we believe there need to be some Federal incentives for HOV lane planning and development by local officials. Further, there needs to be melding of highway and transit funds in order to solve the problem of who is responsible for paying for the HOV lanes.

Turning from the infrastructure to a related area, that of equipment, we have a new problem we need to come to you with which we think could be solved, perhaps, by this legislation, although I'm not sure. The intercity bus industry needs, in some instances, to have a 45-foot bus. This is five feet longer than the current bus, the one that has been in use for many, many years. In heavily congested areas like the northeast corridor, it makes sense to have the most possible passengers per vehicle. In addition, it is also desireable environmentally to have more passengers in fewer vehicles.

Our problem is not one of manufacture. We know how to make them. We can make them. It is rather one of lack of uniformity of regulations from State to State. It is unclear why 40 feet became the maximum length limit for intercity buses in a majority of the States, but it is.

There is no apparent relationship that we have been able to find between the maximum length limit for intercity buses and highway safety. Since highway safety is our primary concern, and the excellent record of the intercity bus industry would bear that out, we would have to pause, were this an issue. But since it is not an issue, what we need is for this committee to consider preemption or

some kind of solution with us of these various State laws so that we may be permitted to manufacture and operate 45-foot buses on the Federal highways of this country.

Having mentioned safety, I turn to it just for a moment to one particular issue that is troubling us. You all know the background on this. I won't go into it. I will simply tell you that we still are waiting for the Federal Highway Administration to issue a final regulation to bring private not-for-hire carriers of passengers under coverage of the Federal Motor Carrier Safety Regulations, as was mandated by Congress in the Motor Carrier Safety Act of 1984. This regulation has still not been issued by FHWA.

While we are still talking about highways I want to voice our continuing support of H. Res. 41, expressing the sense of the House in opposition to an increase in Federal fuel taxes to reduce the budget deficit. We agree with all of you that raising the fuel tax now does not make sense, let alone the idea of raising it for the wrong reason, to solve the Federal deficit problem. The leadership of the Public Works Committee deserves to be highly commended for introducing H. Res. 41 last year, and for gathering cosponsors now totaling considerably more than a majority of the Members of the House. We congratulate all of you for this and we wish you good luck, and we will keep working with you in obtaining its passage by the House.

In conclusion, just a few thoughts of our industry on two mass transit items, charter bus service and competitive contracting of transit services.

The Urban Mass Transportation Administration, after some 10 years of consideration, issued charter bus regulations on April 13th, 1987. These regulations were then amended slightly by UMTA on December 10th, 1988. The regulations prohibit local transit authorities, with certain exceptions, from providing charter bus service with UMTA-funded buses or facilities so long as private bus operators in the area are willing and able to provide the service.

Almost three years of experience with these charter regulations have demonstrated that Congress and UMTA both acted wisely. The regulations are working to the benefit of all. Where disputes have arisen, the differences have been resolved amicably in almost every case.

In the 1982 Surface Transportation Relocation Assistance Act, Congress prohibited the ICC from granting interstate charter operating authority to recipients of governmental assistance for the purchase or operation of buses. This, and section 3(f) of the UMTA act, have leveled the playing fields for charter bus competition. All we ask you today is not to disturb either of these pieces or legislation, nor the resulting regulations, in your upcoming reauthorization process.

And finally, another UMTA act provision, the requirement to involve the private sector "to the maximum extent feasible" in the planning and implementing of transit service. Indeed, as we have argued for a long time, there is no law that says that public transportation must be provided only by public entities. Where certain transit services are put out for competitively-bid contracts, both public and private operators may bid. Control of the service—

things like schedules, fares, type of equipment, even drivers' uniforms, colors, paint jobs of the equipment—is all maintained by the public agency. The winner of the bid is merely the provider of the service and not a decision- nor a policy-maker. Everybody wins again in this public/private partnership for a number of reasons, reasons that include that the public agency chooses what service it will contract out; the private operator has the opportunity to participate in the provision of service; and the public receives service that costs less because of the competition and therefore requires less subsidy and saves scarce public funds.

Competitive contracting is working in a number of places around the country today. All the American Bus Association asks is that the private bus industries' right to participate and to be included to the maximum extent feasible be preserved in this next round of amendments to the Urban Mass Transportation Act.

Thank you very much.

Mr. PAYNE [assuming chair]. Thank you very much, Ms. Perry.

In your testimony you indicate that ABA is in favor of a Federal transportation policy that supports public/private partnerships. The National Transportation Policy also supports greater private sector involvement for addressing the Nation's transportation needs.

What types of new public/private sector initiatives would the American Bus Association support?

Ms. PERRY. Well, particularly those few that I mentioned in my testimony, Mr. Payne. The intermodal transportation centers is crucial right now so that we can have new, safe, clean terminals around the country, and the right to participate more and more in the provision of some public transit services. Those two are the most important to us at this time.

Mr. PAYNE. How do you see that these initiatives would benefit the public sector?

Ms. PERRY. They benefit the public sector in that, for instance in the transportation centers, the centers are built with public funds—sometimes Federal, a combination of Federal/State, local, all public funds—and by allowing the private operator to use them. The private operator is paying rent and whatever other expenses go along with it, so it helps to operate some of those operating expenses, which would be public funds.

The same thing on the provision of transit services side. We have found and experienced—it is limited so far, but it is beginning to show—that savings to the public average about 30 percent. So simply by saving public funds is how the public benefits, and in some cases, by providing better service.

Mr. PAYNE. One of the issues that we hear a lot about, and one certainly that our Nation is facing today, is urban traffic congestion. Would the authorization of a flexible urban transportation program that provides Federal funds for highway and/or mass transit purposes create a significant incentive for urban areas to construct HOV lanes to relieve traffic congestion?

Ms. PERRY. I would hope so. Ken and I had talked about this recently, about going back to urban block grants. Perhaps it would. I think those decisions can be made very wisely at the local level. I think each local area knows what its congestion problems are. We

know from our industry, since we face the urban congestion in every single urban area of the country, that it is all over. It is out there, and that's why we say some kinds of Federal incentives, and I think that would help to alleviate those problems.

Mr. PAYNE. Under the existing Federal law there are limitations on vehicle sizes and weights. Does the ABA support establishing limitations on vehicle lengths?

Ms. PERRY. Well, our problem with the vehicle lengths is that some of the States have limitations which in some cases seem to be artificial because we're not sure why they are, since they vary so greatly, and they certainly make a burden for us and, indeed, on interstate commerce. When you are trying to go from State to State and you have all these different limits on the length of the vehicle, it's almost impossible to conduct interstate commerce.

So that is the best answer I can give you. I'm not sure but I think that we can't, as I said, find any rhyme nor reason why the standard bus was 40 feet long, but beyond that, we certainly don't understand now why some States say 42 and one says 42.5 and another says 50 and some say 60, and then there are a lot of exception for 60- and 65-foot articulated transit buses. It's just another lack of uniformity between and among the States that becomes burdensome when you are in interstate commerce.

Mr. PAYNE. Let me ask you one other question and then we'll have to adjourn briefly for a vote. If you could be brief so that I don't miss this vote, I would appreciate it.

The committee has received testimony supporting the elimination of certain motor fuels excise tax exemptions. What effect would the elimination of the $0.03 diesel fuel exemption for intercity bus operators have on the bus industry?

Ms. PERRY. The elimination would be disastrous. Actually, it's elimination of a $0.09 exemption—of a $0.12 exemption, rather. The diesel fuel tax is $0.15, and we pay $0.03 unless we're doing transit work, and then we don't pay any of it.

The elimination to this industry at this time would be devastating in trying to get back on its feet. We can't pass it on to our consumers who, as we say, are the very old, the very young, the very poor, and the very rural. It probably only amounts to maybe $20 million a year to the Treasury, but to our industry and to individual operators it can very well be the difference in making or breaking a very small profit margin.

Mr. PAYNE. Thank you very much. I appreciate that fine testimony.

Mr. Shuster, did you have any questions?

Mr. SHUSTER. I would make the point that Ms. Perry has been telling me what to do for the last 15 years [laughter] so I think I know everything she has to say.

Ms. PERRY. Thank you.

Mr. PAYNE. Well, thank you very much.

[Ms. Perry's prepared statement appears on page 928.]

Mr. PAYNE. We will stand adjourned for a few minutes in order to vote, and we will reconvene just as soon as we are able to get back.

[Recess.]

Mr. MINETA [resuming chair]. The subcommittee will please reconvene.

At this time we have the pleasure of hearing from Mr. Harold E. Smith, President of the American Public Works Association, who is the City Engineer for the city of Des Moines, Iowa.

Mr. Smith, your statement will be made a part of the record, so you may go ahead and proceed in your own fashion, sir.

TESTIMONY OF HAROLD E. SMITH, PRESIDENT, AMERICAN PUBLIC WORKS ASSOCIATION, AND CITY ENGINEER, CITY OF DES MOINES, IA

Mr. SMITH. Thank you, Mr. Chairman, Mr. Shuster, members of the committee. It is a privilege for me to appear here today as President of the American Public Works Association. I might add that as City Engineer of Des Moines, I didn't like any of that talk I heard earlier about overloaded axles coming off the primary system onto my local streets in Des Moines, Iowa. It's one of the big problems in America, I guess.

The American Public Works Association is a nonprofit educational and professional association whose origins date back to 1894. We are located in Chicago, Illinois, with a governmental affairs office here in Washington. The purpose of the Association is to assist public works agencies in fulfilling their responsibilities and to enable people involved in this field to work together to improve their professional practice.

Membership is comprised principally of local officials, but also includes strong representation from State and Federal levels of Government. Educators and representatives of the private sector are also counted among our 28,000 members in the United States and Canada.

The Association's Institute for Transportation focuses on the development and management of the infrastructure required for all modes of transportation, including the maintenance of streets, highways, bridges, transit systems, airports, waterways, harbors, docks, and other public facilities needed for the transportation of people and goods.

This Institute exists to promote high standards of competence in transportation. It conducts surveys and studies and collaborates with APWA's education and research foundations in presenting training programs and conducting research projects.

APWA and its Institute for Transportation have long been concerned with the direction our Nation's surface transportation programs should take in the post-interstate era. We have been proud to serve as a member both of the Advisory Committee on Highway Policy, which under the leadership of the Highway Users Federation conducted an unprecedented series of 65 public forums across the country between August of 1987 and May of 1988, and of the Transportation Alternatives Group, a nonpartisan coalition of 12 major national public and private sector organizations with a broad concern for the future of the Nation's surface transportation.

The Transportation Alternatives Group was developed by the American Association of State Highway and Transportation Officials as a means to build consensus among the multi-varied inter-

ests concerned with transportation. It has worked diligently over the last 18 months to identify transportation issues where a consensus was important and could be achieved. I truly believe that it is a tribute to this unique coalition that 12 diverse organizations have been able to agree to a set of important policy recommendations in the areas of program orientation, intergovernmental roles and responsibilities, and investment levels and funding sources. These recommendations can be found in the Transportation Alternatives Group's final report entitled "Future Federal Surface Transportation Program: Policy Recommendations," a copy of which I will provide, Mr. Chairman. (See p. 949.)

As a participant in the Transportation Alternatives Group, APWA sought involvement of its membership to develop its own positions on the major surface transportation issues of the day, as did most of the other participating organizations. We formed a special task force on transportation policy and prepared a report, "Moving America into the 21st Century." This report, which was approved by APWA's membership at its annual meeting last year, lays out six principles and supporting APWA position statements for the development of the Nation's surface transportation policy and implementation programs for the post-interstate era.

Mr. Chairman, my written testimony before you includes the full text of the six principles and supporting APWA position statements as they were approved by APWA's membership last September. In the interest of time I do not propose to read the entire statement. Instead, I would like to focus on the highlights and the pertinent points of the work by this subcommittee.

First, APWA believes it is imperative that there be a stable, reliable, and adequate source of funding for all forms of surface transportation. We must turn around the 30-year decline in transportation spending and the consequences of underinvestment. APWA believes that to do this will require a continued local, State, and Federal financing partnership, and we've heard that word on several occasions today.

We are therefore urging local and State governments and Congress to provide increased funds to finance existing transportation deficiencies and to meet future needs. In the case of Congress we are specifically asking that, one, the Congress separate transportation trust funds from the unified budget and use them exclusively for transportation purposes; two, that it spend down the sizeable balances in the trust funds on a timely basis; and three, that it increase Federal fuel excise taxes and index them to the gross national product.

We also urge that Congress adopt a long-range capital budget with emphasis on an integrated national transportation program.

Second, APWA believes that preservation of the physical integrity and safety of the existing transportation system—highways, streets, bridges, and public transportation systems—must receive the highest priority under a new surface transportation program. To this end we believe that Congress should increase funding to restore or replace deficient bridges, increase funding for the 4-R program to protect the Nation's investment in the Federal-aid Highway System, and not increase allowable truck sizes and widths

beyond those authorized by the 1982 Surface Transportation Assistance Act.

Third, APWA believes that we must strengthen the local, State, and Federal partnership that works to integrate the many separate components of the national surface transportation network. We believe that Congress can assist here by, one, adequately funding a formal mechanism to support a regional perspective on the planning and programming of surface transportation programs; two, by removing unnecessary restrictions as a condition of Federal funding; and three, by keeping administrative requirements under Federal-aid programs to a minimum.

Fourth, APWA applauds Transportation Secretary Skinner in his support for more money for research. APWA believes that if our transportation systems are to continue to be world class, we must have a permanent, reliable, and much greater level of funding for research, education, training, and the application of new and existing technology. We are asking Congress to earmark a specific percentage of the Highway Trust Fund to support a national research, education, and technology transfer program. And to ensure the protection of our environment, we urge Congress to direct adequate research and development funds to the use of alternative fuels, flexible fuel vehicles, and fuel distribution systems.

Fifth, we are all concerned about urban and suburban congestion. We know that congestion is crippling the ability of our urbanized areas to work effectively. APWA believes that Congress must attack this problem head on and set aside funds for an urban/suburban congestion program. This funding should be flexible and not mandate solutions by mode or expense category. Under a new national surface transportation program, local officials and their constituents should be encouraged to use transportation management associations, community van pools, flexible working hours, and other approaches to demand management.

Finally, we have heard in testimony earlier today that rural America also needs help, and we support that. Just as its urban counterpart, it has experienced a dramatic shift in demographic patterns and transportation needs. Its transportation systems are in visible need of repair. APWA believes that Congress should increase and earmark funds to address the surface transportation needs of rural America. Again, these funds should be flexible and provide incentives for State governments to increase their support of the existing rural transportation system. They should also support technology transfer programs, such as the very successful Highway T-Square and the Transit RTAP that focus on cost-effective solutions that can be readily implemented by local officials.

To close, as I suggested earlier, the American Public Works Association has served the public works profession, and indeed the public at large, for a very long period of time. The Association will celebrate its centennial in 1994. We would welcome and appreciate no better present for our 100th birthday than to have in-place Federal legislation that reverses the 20-year trend of Federal underinvestment in the Nation's decaying surface transportation system, that takes the leadership in research, education, and technology transfer, and works with State and local governments to build a sound foundation to move America into the next century.

What we have heard earlier today echoes what was heard at all of the hearings across America. Every city of every size, I think, has some kind of a transportation problem. I think Transportation Department Secretary Skinner hit it right on the head in his opening comments in Moving America: "An investment in transportation is an investment in America's future. No industry in the Nation is more important to U.S. economic growth and international competitiveness than transportation."

My projects in Des Moines, Iowa are no less important than the projects that we heard about in the Commonwealth of Virginia today.

Mr. Chairman, members of the committee, I want to thank you for allowing me the privilege to appear before you today on behalf of the American Public Works Association.

Mr. MINETA. Mr. Smith, thank you very much for a fine statement.

I am wondering, the Surface Transportation Act of 1987 authorized a study to be conducted by the Secretary of Transportation to study motor vehicle sizes and weights and their effect on pavement, bridges, highway revenues, and cost responsibility and highway safety. Based upon the recommendations of the motor vehicle study, would APWA support changes in truck sizes and truck weights?

Mr. SMITH. From a technical standpoint, Mr. Chairman, the life cycle of any pavement is determined by the number of cycles of axle loadings. We have performed many studies over the years to arrive at the design life of pavements. The American Public Works Association would not be in favor of expanding weights or lengths of vehicles that would cause additional damage and shorten the life cycle of the existing pavements that we have in this country.

You mentioned potholes earlier. This is the time of the year in the snow belt, in my area, at least, when we experience the pothole problem. Pavement needs maintenance, and a very active part of our APWA programs is geared at timely preventive maintenance to our highway systems to keep them in shape so that they do not deteriorate before their life cycle expires.

I hope I answered your question.

Mr. MINETA. Do you see a continuing need to provide Federal-aid funds for public mass transportation operating assistance?

Mr. SMITH. Is there a continuing need? I think we heard earlier that there is general support for mass transit.

Mr. MINETA. And that would include the operating assistance to the system?

Mr. SMITH. Yes, sir.

Mr. MINETA. APWA believes Federal policy should not hamper the ability of State and local governments to generate revenues to fulfill their transportation responsibilities. Would an increase in the Federal excise taxes and the indexing of the taxes to the gross national product hamper the States' ability to raise excise taxes?

Mr. SMITH. I think the whole tax increase issue has to be studied. We all know that it varies from State to State.

What we have to do is find ways to not only fund our needs, but to do that in a timely manner. My own experience, and I'm sure it's been related by others, is that it takes some 10 to 12 years to

realize a federally-funded portion of roadway from conception to completion. We haven't heard the words "red tape" or "bureaucracy" in the last few years, but the procedure is still very cumbersome to get through all of the Federal requirements to build a project.

Mr. MINETA. Mr. Smith, yesterday in response to one of the questions that was asked—the question that was asked was, how much is added to the cost of a project because of delays, whether the delays are caused by alternative analyses, environmental impact reports, things that add to the cost of the project but never add to the concrete work; it adds to the cost of the project but it doesn't do anything toward the project itself?

Mr. SMITH. Inflation?

Mr. MINETA. Inflation, whatever. Has APWA looked at that in terms of how to cut down the paperwork, cut down the time, cut down whatever it is that results in that 20 to 30 percent that is added to the cost of a project?

Mr. SMITH. I would be surprised if it would not be more than that. As I indicated, it takes a 10-year time to go through all of the corridor studies, environmental and social impacts, and all of the things that we have to do.

We are also faced with regulations from other agencies other than the Federal Highway Administration, from EPA primarily, with contaminated subsoil conditions and all of the new emphasis on environmental issues which can delay a project significantly.

Any delay increases the cost.

Mr. MINETA. And have you taken a look as to how to maybe get away from some of those, or all the hoops that you have to go through now? Is there a way that someone can help us out to see whether or not we can alleviate steps, cut down benchmarks when certain things have to happen?

Mr. SMITH. We had a very active program several years ago on reducing red tape. That helped. I think a new emphasis has to be looked at in these areas.

The answer that you may be looking for that I am reluctant to give is, use your own money and don't be dependent on Federal funding. A case in point, a sewage treatment plant in Des Moines that could have gone along and been built in 1973 for $30 million, under EPA regulations is being finished up now in 1992 at a cost of $165 million.

So it's a 20-year project, and the cost increased five times.

Mr. MINETA. But has that gone from secondary to tertiary treatment?

Mr. SMITH. No, sir. Just area-wide planning, facility planning, putting 12 governmental entities together into a regional facility——

Mr. MINETA. But at one point BOD was one requirement, and today BOD is another requirement?

Mr. SMITH. That's correct.

Mr. MINETA. That would have added to the cost of it?

Mr. SMITH. That's part of the design, yes.

Mr. MINETA. Okay. Well, thank you very, very much, Mr. Smith, for your testimony. I'm quite sure that somewhere along the line we're going to be talking to all of you at APWA in terms of how to

improve the process so that we don't have that 20 or 30 percent additional cost, whatever it is, to all of us.

Mr. SMITH. As an organization, I hope that we can be actively involved in that kind of interchange.

Mr. MINETA. Good. Thank you very, very much, sir.

[Mr. Smith's prepared statement appears on page 943.]

Mr. MINETA. I would now like to call on Mr. Joseph P. Kirk, Executive Director, Mon Valley Progress Council, Inc., and Chairman, Mon/Fayette Expressway Association.

Mr. Kirk?

TESTIMONY OF JOSEPH P. KIRK, EXECUTIVE DIRECTOR, MON VALLEY PROGRESS COUNCIL, INC., AND CHAIRMAN, MON/FAYETTE EXPRESSWAY ASSOCIATION

Mr. KIRK. Thank you, Mr. Chairman.

Mr. Chairman and members of the Surface Transportation Subcommittee of the House Public Works Committee, my name is Joseph Kirk. I am Executive Director of a corporate-sponsored community and economic development not-for-profit corporation called the Mon Valley Progress Council, and Chairman of the Mon/Fayette Expressway Association. The Progress Council, which is celebrating its 25th anniversary, serves a region located 25 miles south of the city of Pittsburgh. The Mon/Fayette Expressway Association is a coalition of local leaders committed to the timely development of the expressway project. An attached map in my testimony provides the service area of the Progress Council and the location of the Mon Valley/Fayette Expressway.

It is a pleasure to have the opportunity to appear before this committee on an issue of such profound importance as highway development. I would add that I really do sincerely appreciate this opportunity in light of the fact that most of your speakers have been representatives of national associations, and ours is the only case of a local group, at least in today's testimony.

As a member of a committee that deals with important issues of transportation, you are acutely aware of the direct relationship between economic viability and the availability of a modern highway system. In economic development efforts, the presence of highway systems that provide access to markets is indeed a prerequisite for the location of industry.

For the Mon Valley region, the development of a new highway link is essential for the economic revitalization of our region. The devastating industrial decline of our region in the early 1980s is widely known. Although progress has been made in providing employment for the 100,000 people who lost jobs in that time, unemployment in the Steel Valley communities is still in the double digit range.

Despite a deep commitment to our own highway project, my purpose in appearing before this committee is to speak to a much broader highway development issue. The 1987 Surface Transportation Act toll road provisions, developed under the leadership of this committee, set into motion a policy that can indeed have a profound impact on the development of necessary economic development highways, such as the Mon Valley/Fayette Expressway. The

recently issued National Transportation Policy report speaks of this on page 118 by stating that the Administration will develop legislation consistent with the principle to "allow greater use of toll financing on Federal-aid highways."

Testimony provided by southwestern Pennsylvania and West Virginia groups at hearings in the development of this policy is cited on page 25 of the report. I would note that that made reference to the need for highways in the Appalachian area to provide links for economic development purposes.

In our efforts to encourage the next step in the promotion of toll roads we have consulted with a variety of highway user groups, elected officials, and construction associations, including the International Bridge, Tunnel, and Turnpike Association; the American Road and Transportation Builders Association; Associated Builders and Contractors; Contractors Association of Western Pennsylvania, and the American Truckers Association. I am not suggesting that we represent a policy position of these groups. However, it is fair to report that our proposal has earned the interest for the aforementioned.

Our proposal to promote new economic development highway links is based on three principles.

First, a limited Federal toll road strategy enhances the opportunity to develop priority economic development links.

Second, the Federal Highway Administration should play an active role in directing the development of such roads, consistent with the provisions of the 1987 act.

And third, the 1991 reauthorization of the Surface Transportation Act should include specific direct financial support for the implementation of a toll road policy.

Gentlemen, what we are proposing is a targeted Federal initiative to promote the development of important new highway links consistent with the national policy objective of "increasing the local share of Federal aid for transportation." That is directly from page 44 of the report. We clearly need to have a new initiative to promote new highways in the light of the sort of difficulties we face on the maintenance of existing roads.

The priority highway link program we propose would be targeted to the construction of new, limited-access interstate-grade highways. This could indeed be a subpart of the Highways of National Significance program mentioned earlier today. Attached to my testimony is a copy of the details of our proposal. If implemented, the proposal would provide direct Federal support for 75 percent of the 35 percent Federal aid approved under the toll road provisions of the 1987 act. This would represent 26 percent direct Federal assistance for priority highway links. The 9 percent difference would be supported through existing Highway Trust Fund appropriations to the States.

Funding for this initiative could be supported by an increase to the authorized level of the Federal Highway Trust Fund. The amount of the increase would be based on the financial needs of such projects and reflective of fiscal realities. Each State would be permitted to seek designation for one toll road under the program. Funds would be allocated on a competitive basis.

Although we feel that a toll road strategy is the most effective means to develop economic development highway links, consideration should be given to broadening the participation to permit other innovative public/private financing techniques or mechanisms. The use of such innovative techniques is repeatedly referred to in the National Policy Report. For our region, the priority highway link program would provide a means to ensure the timely completion of the Mon Valley/Fayette Expressway. On a national level, the proposal would place the Federal Government in a leading role for the implementation of innovative techniques that promote a wide range of financing strategies necessary for the development of new highways.

Again, I thank you, and I welcome your questions.

Mr. MINETA. Thank you very much, Mr. Kirk.

Could you briefly describe your experience in advancing that Mon Valley pilot toll project?

Mr. KIRK. Sure. First, I come from about 15 years' experience in the economic development area. I worked in South Carolina for a number of years and worked for a university and taught courses in economic development, and now have been Executive Director of the organization I'm with for some three years.

Our background is that the Mon Valley Progress Council had been active for quite a number of years as an organization in the promotion of this project, and in fact helped to move the project forward on both a State and Federal level prior to 1987.

Mr. MINETA. The Progress Council is proposing to limit the number of toll projects within States to just one project. Why is that?

Mr. KIRK. Again, Mr. Chairman, if you look at the 1987 demonstration program, the intent was to take a very limited approach to toll roads, not to really look to opening the door to toll roads across the Nation, which I think is counter to commerce, and to look at this as a technique to advance a limited policy on the Federal level by providing some financial assistance toward that. That is possible if we limit the number of toll roads per State.

Mr. MINETA. Very well. Thank you very, very much, Mr. Kirk, for being before us.

[Mr. Kirk's prepared statement appears on page 888.]

Mr. MINETA. I would now like to call on Mr. Thomas S. Stedman, Vice President, National Private Truck Council, and Director of Corporate Transportation for Walgreen Company—oh, I see that Mr. Stedman has changed.

Mr. Eisenhart, it is nice to see you.

Mr. EISENHART. I don't know that Mr. Stedman has changed, but unfortunately Mr. Stedman is unable to be here due to an illness.

Mr. MINETA. Please proceed.

TESTIMONY OF EARL B. EISENHART, STAFF VICE PRESIDENT FOR GOVERNMENT AFFAIRS, NATIONAL PRIVATE TRUCK COUNCIL

Mr. EISENHART. My name is Earl Eisenhart. I am Vice President for Government Affairs, National Private Truck Council, and I will be delivering Mr. Stedman's statement on his behalf.

I appreciate the opportunity very much to be here this morning to express the positions of the National Private Truck Council on the reauthorization of the Federal Highway Program.

The National Private Truck Council represents private fleets, that is, companies that own and operate their own trucks in support of their primary business activities, whether that be manufacturing, retail, distribution, service, or whatever it may be. Approximately two-thirds of the large trucks that you see on the highway are private fleet trucks. We haul well over 50 percent of the Nation's freight which is hauled on the Nation's highways.

Mr. Chairman, the condition of our highway transportation system directly affects our domestic economic strength and our overall quality of life. Highway transportation costs are imbedded in virtually every product and service produced in America. The cost and quality of highway transportation have a direct bearing on profits, prices, capital investments, and subsequently on exports. American business cannot remain competitive in world markets if we allow our highway system to deteriorate and if shippers and carriers are not able to make the most productive and efficient use of that system.

A highway system which will allow American industry to be as efficient and productive as possible relies on two critical elements: the physical integrity of highways, roads, and bridges, and a predictable and uniform system of regulations governing commercial vehicles.

With respect to maintaining the physical integrity of the highway system, NPTC recommends the following.

First, the program must include a level of funding which is sufficient to maintain the value of existing highway transportation assets, provide for selective highway expansion, and ensure safety. NPTC believes that an increase in highway funding is needed to meet these needs from the current level to perhaps $17 billion to $19 billion per year. According to the Highway Users Federation and studies done by that group, these funds can be provided by drawing down the balance in the Highway Trust Fund in a responsible manner over the next several years without the need to raise highway user taxes.

Second, with respect to highway expansion, we believe there is a need for some selective additions to the system, particularly to relieve congestion in some urban areas and to serve traffic patterns brought about by demographic changes.

Third, we need to maintain the Highway Trust Fund as a mechanism to finance the Federal Highway Program. It has been an excellent program. We still need it, and we need to make sure that those funds are available to take care of our unmet highway needs, now and in the future.

Fourth, let's not use the fund or highway user taxes to reduce the Federal budget deficit. It is a bad idea, pure and simple. First, it would destroy the concept of trust in the Highway Trust Fund, and taxes on fuels are regressive. This major burden of reducing the deficit would not be tied to the ability to pay, but would be placed unfairly on individuals and businesses who use the highways to get to work or in the conduct of their business.

Fifth, let's not use the Highway Trust Fund for other non-highway purposes, either. NPTC fully understands that American industry is being asked to pay a lot more in highway taxes and user fees. In fact, this is already happening. Eighteen States have recently raised fuel taxes, and most of the others are expected to follow suit shortly.

We are not shunning our responsibility to pay our fair share, but we would like some assurances that the taxes and user fees which have already been paid and will continue to be paid into the Highway Trust Fund will in fact be used for the purposes for which we thought they were collected.

Sixth, Congress should act to correct a severe drain on the Highway Trust Fund revenues by eliminating the $0.06 per gallon gasohol fuel tax exemption. Gasohol-using vehicles cause the same wear and tear on the highways as other vehicles and should pay a fair share of the maintenance and repair.

I would like to take just a few seconds to talk briefly about the issues of uniformity of State tax regulations as well.

While the need to maintain the physical integrity of our national system is clearly of paramount importance, it is also extremely important that we make the most productive possible use of that system. Unfortunately, this can't be done under the current system of State economic regulations, tax procedures, and operating restrictions.

To relieve this problem, NPTC recommends that the following be done.

First, eliminate remaining economic restrictions on the efficient use of trucks.

Two, promote uniformity in State tax procedures.

Three, limit the sheer number and variety of taxes imposed on trucks.

Four, allow greater access for vehicles authorized by Federal law.

With respect to the first two points, NPTC strongly endorses legislation which was introduced yesterday by your colleague on the committee, Mr. Hastert, which would resolve a large number of these regulatory problems by getting rid of costly State economic regulations and by requiring uniformity in State tax procedures. We urge the committee's support for this important legislation.

As a final point, Mr. Chairman, let me just say that with respect to the National Transportation Policy and the focus on decentralized funding responsibility for highway construction and repair, we recognize it may be true that local highway needs should be more directly financed by local assessment of user fees. At the same time we are concerned that this may lead to a proliferation of inconsistent tax procedures, and indeed, to a larger number of local tax schemes that are directed at trucks. So we have a very real concern about that. We don't need a greater proliferation of inconsistency in our regulations imposed on trucks, and as a country, I don't think we can afford them. This is a time when we have to be competitive, we have to be efficient, and we have to be productive if we're going to be able to compete in the world marketplace. We believe that these inefficient barriers to highway transportation should no longer be tying us down.

38-253 O—91——21

Thank, you, Mr. Chairman. I would be pleased to respond to any questions that you may have.

Mr. MINETA. Thank you very much, Mr. Eisenhart.

The committee has received testimony in support of developing a post-interstate highway program based on a category of Highways of National Significance which would include the existing Interstate System and certain major arterial highways. Would NPTC support the inclusion of certain urban highways under this new proposal?

Mr. EISENHART. We want to look at the urban highways, but in general, I think the answer to that question would be yes, particularly if it is needed to resolve serious congestion problems. We feel that there is a need there and that there can be funds provided for that through spending down the excess in the Highway Trust Fund. We would support that for urban area highways to relieve congestion.

Mr. MINETA. Research supported by the National Private Truck Council shows that it is possible to have higher capacity trucks that are as safe as other trucks. Would the productivity benefits achieved through the use of higher capacity trucks require higher taxes for those vehicles to pay for the additional wear and tear on the highway system?

Mr. EISENHART. Mr. Chairman, in the research that we've seen, we think that the weight of evidence is that it's possible to have higher capacity trucks that do not cause additional wear and tear on the highway surface. We would support those higher productivity trucks for the reason that they are more productive and because we think they can be put on the highways without increasing the wear and tear on the surfaces.

Mr. MINETA. Very well. Thank you.

Mr. Hastert?

Mr. HASTERT. Thank you, Mr. Chairman.

We have about talked the gamut, but it really comes back down to trust funds and what you pay and what you get back. I will ask you the same question I have asked previous witnesses.

If we doubled the gas tax, ostensibly to shade the deficit or to pay off the deficit, what would that do to your industry?

Mr. EISENHART. It would be a disaster, Congressman.

I think that the other point, too, is that that's an extraordinarily regressive tax, as I think previous witnesses have testified. It seems inappropriate and unfair to us to ask people who use the highway system as a part of their business or to get to work, or for whatever reason, to take the burden, that tremendous burden of reducing the deficit. Reducing the deficit is a top priority and we all have to have a part in that, but let's not undermine our productivity and the efficiency of American industry at a time when we need that so desperately to compete in the international marketplace.

Mr. HASTERT. What is the position of your association as far as the excess in the Highway Trust Fund that we have?

Mr. EISENHART. We feel very strongly that that money ought to be spent down in a responsible manner over the next several years. We also feel very strongly that that money should be dedicated exclusively to highway needs, with the exception of the so-called transit penny, that it should not be used as an offset against the deficit.

Mr. HASTERT. If you had a wish list that you might like to include in the transportation act or some type of legislation, what are some things that need to be done to enhance and make your industry more competitive? I view our transportation as really the key to competitiveness, both in this country and internationally. What do we need to do?

Mr. EISENHART. Well, let me emphasize that we are strong supporters of the Hastert legislation that was introduced yesterday. We would like to see those kinds of productivity improvements included in highway legislation. We believe that the International Registration Plan and the International Fuel Tax Agreement are ideas whose times have come, and now ought to be implemented, and we certainly feel that we need to get rid of these outdated and outmoded State economic regulations that are a real productivity drain on American industry. It costs the U.S. Treasury absolutely nothing to do that. It's one of the beauties of it.

The time has come now to do away with some of those regulations that do nothing but cost American industry tremendous amounts of money. So that would be on our list.

Mr. HASTERT. What is the cost to your industry, and then, of course, to the consumers?

Mr. EISENHART. It's really billions of dollars. I don't have the figures here with me, Congressman, but we would certainly be happy to supply those. There is research that has been done that puts a dollar amount. I would be happy to supply that to the committee.

Mr. HASTERT. Thank you.

[Information received from Mr. Eisenhart to be supplied follows:]

A recent study by W. Bruce Allen, professor of public policy at the Wharton School of Economics, shows that the U.S. Economy would gain up to $12 billion each year from the removal of State economic regulations on trucking.

Mr. HASTERT. One of the things that we've talked about and that previous witnesses have talked about is the intermodal part of the transportation industry. As we become more and more dependent on the "just in time" philosophy and those types of things, do you think that part of that Federal dollar should go for updating those intermodal facilities and the infrastructure that would be involved in that?

Mr. EISENHART. Well, I think intermodalism is an important element. It is going to be an important element in the future. If you mean, should we take a part of the Highway Trust Fund and use it to support intermodalism, I would be cautious about that. I think we have a tremendous number of highway needs out there that are unmet, and I think we need to make sure we use that money for highway purposes. Government support for intermodalism in some form may be appropriate, but as far as the Highway Trust Fund is concerned, we believe that that ought to be addressed to highway needs.

Mr. HASTERT. Fine. Thank you.

Thank you very much, Mr. Chairman.

Mr. MINETA. Mr. Lewis?

Mr. LEWIS. No questions, Mr. Chairman.

Mr. MINETA. Well, thank you very, very much, Mr. Eisenhart, for making this presentation. I hope Mr. Stedman—is it personal illness on his part?

Mr. EISENHART. It's an ear infection. I think it's not serious, sir, but he didn't feel like he wanted to fly.

Mr. MINETA. I don't blame him.

Thank you very, very much.

[Mr. Eisenhart's prepared statement appears on page 848.]

Mr. MINETA. At this time I would like to call on Mr. K. Michael O'Connell, Counsel, Owner-Operator Independent Drivers Association.

TESTIMONY OF K. MICHAEL O'CONNELL, COUNSEL, OWNER-OPERATOR INDEPENDENT DRIVERS ASSOCIATION, INC.

Mr. O'CONNELL. Thank you, Mr. Chairman, members of the committee, and committee staff. My name is Michael O'Connell and I appear as counsel to the Owner-Operator Independent Drivers Association. OOIDA is the national trade association representing the Nation's more than 350,000 independent truck owner-operators.

Owner-operators typically are the smallest of small businesses in the trucking industry. They lease their equipment and services to larger trucking companies. As Mr. Donohue mentioned earlier, 96 percent of the companies in the trucking industry own six or fewer trucks, and these are generally owner-operators.

We applaud the committee for holding these hearings. While there are a number of highway issues that we would like to address, given the time constraints we will limit our testimony at this time to only four.

First, it is the belief of OOIDA that the Federal Government must maintain its historically strong role in highway policy. We do not believe that the Department of Transportation's policy shift, which would place greater emphasis on the States, is wise. We need a national transportation system, not a collection of 50 States or 48 States that have interconnecting roads.

The States in the past have proven reluctant to take the steps necessary, and to take the political heat to raise taxes in their States, by imposing taxes on their own citizens. As a result, in the past 10 years we have seen a series of discriminatory highway taxes to try to tax out-of-State interests, and then retaliatory taxes to try to retaliate against those States that are trying to tax out-of-State interests, and a field day for lawyers—such as myself—in the courts, trying to overturn these. OOIDA does not believe that this is a wise or prudent system as we face competitive issues as a Nation in the 1990s.

Another area where the States have diverged greatly is in the areas of licensing, permitting, and registration. These requirements are burdensome, duplicative, and they add little to the States, while imposing a great burden on the productivity of the trucking industry. They are also used to raise revenues, and they result in lost productivity.

The problem is long-standing. When I first became acquainted with the truck transportation industry in 1979, one of the main problems was that of State uniformity, and in 1990 it still is.

OOIDA applauds the Hastert bill, and it hopes that the bill will be supported by the committee. We think that if it is not, it is time during the reauthorization process to address this issue and to homogenize the truck transportation system.

We also believe that a national transportation policy must be neutral as to the choice of modes of transportation. There are a number of suggestions in the policy that was issued by the Department of Transportation in using the "underutilized modes" of transportation, such as rail. We don't believe that it is a legitimate role of the Federal Government to cause modal shifts through specific policies—taxation or otherwise. We think that the issue should be left to the marketplace without Federal intervention.

Along those lines OOIDA also opposes the increased use of toll roads. The policy is especially inappropriate to even be considered at a time when there is a huge surplus in the Highway Trust Fund. Toll roads represent a significant opportunity for the States to tax interstate commerce and further proliferate what we've seen over the last 10 years. There is no effective means for accounting for the toll road revenues, and hence they should be discouraged.

The third issue that we would like to address is that of highway safety. It is a very high priority for owner-operators as they spend more than 300 days per year on the road. But safety must make sense. Some of the present safety measures that have been implemented or that are being considered for the trucking industry are driving well-qualified drivers out of the industry. Measures such as drug testing, retinal scanning, tracking of trucks by satellites, computer monitoring of every movement of the driver in the truck—cause good, seasoned drivers to leave the industry. Simply the hassle of going through those types of humiliating procedures for a job that pays $20,000 to $25,000 is not worth it to many. That's one of the reasons that some of the witnesses from the trucking industry have been talking about a driver shortage. That driver shortage should be of great concern to this committee because it represents the greatest highway safety threat. The drivers that are replacing the experienced drivers that are leaving the industry are generally untrained and inexperienced. Inexperienced drivers in heavier trucks mixing with lighter cars, causes a degradation in overall highway safety.

In addition, the current structure of fines in some States for minor paperwork violations in the safety area is nothing more than a revenue-raising measure. One city charged $2,500 for a routine paperwork violation in a driver's logbook. The paperwork violation is that the driver forgot to physically draw a line on a piece of paper when he changed his duty status from having lunch at a truck stop to getting back behind the wheel of his truck and operating it. That is excessive, and those types of fines are eroding the faith of drivers in the enforcement community. They also breed contempt for the safety regulations. Safety must be a consensual process, and it is not now.

We also believe the committee must address the overweight container issue in the context of reauthorization. Overweight containers are causing severe damage to our infrastructure, not only in port areas, but in other areas as these containers are shipped all over the country on rail cars. This is not just a port problem. The

trailers that they are going on are oftentimes poorly maintained. OOIDA had a driver contact it from the Port of Savannah. He was supposed to take a container that was clearly overweight—as Mr. Donohue pointed out, pointing the headlights up at the sky when it was loaded on—and he found that the tire was cut through three layers of cord. He had an overweight container and three layers of cord showing on the tire, so he refused to haul it. It took about two minutes to replace him with another truck that was more than willing to haul it. This is a problem that cannot be addressed by the trucking industry alone. It is simply too competitive an industry.

You might be interested as well in knowing that there is an incentive system for overweight containers that is not often talked about in the industry. The companies who are shipping the containers out of the port areas and out of the railheads offer what are known as "scale fees" which are bonuses for the drivers if they will evade the scales in order to avoid detection of the overweight load. This is a very common practice, the drivers report to us.

On a related issue, OOIDA also believes that the calls for increased truck size and weight should be resisted, that larger and heavier trucks result in reduced safety and overall damage to the infrastructure, and that they should be avoided.

Lastly, owner-operators are the most productive and safest segment of the trucking industry. The California Highway Patrol recently studied the operations of owner-operators and for-hire carriers with employee drivers. CHP found that owner-operators were indeed the safest segment of the industry. That was a joint study with the California Highway Patrol and the Public Service Commission.

The Association believes that the shipping public should be given direct access to owner-operators, and therefore that further economic deregulation of the trucking industry is in order.

Thank you.

Mr. MINETA. Thank you very much, Mr. O'Connell.

Given the policy statement that has just come out from the Secretary of Transportation, and in view of the tremendous highway needs throughout the country and the lack of Federal funds to address these needs, several States have now advocated the use of Federal funds, along with toll revenues, for the construction of these toll facilities.

It is my understanding that the Owner-Operator Independent Drivers Association strongly believes that Federal policy should discourage the use of State-sponsored and private sector toll roads, but I'm wondering, would the Association support the use of Federal funds for the construction of new facilities or for adding capacity on existing facilities?

Mr. O'CONNELL. I think the decision on that would have to be on a case-by-case basis. The Association is generally opposed to toll roads, especially the mix of toll roads and Federal dollars, because we think it amounts to double taxation.

The Association would like to look at each individual project. There are projects where that could conceivably make sense. I think as a blanket policy, though, we would oppose it.

Mr. MINETA. The Association has urged the committee to resist calls for increased size and weight limits. Is this request related to the safe operation of the larger vehicles, or on the impacts that the larger trucks would have on highway pavement?

Mr. O'CONNELL. It is related to both. While there is a problem with the infrastructure that can arguably be dealt with by shifting axle weights, as you are calling for longer and heavier trucks you are creating a real safety problem on the highways. Experienced drivers will tell you that these trucks, especially the 48-foot doubles, are not easy to control. I can tell you from personal experience of going out on the highways and meeting with the truckers that even the drivers that are driving them are not in favor of getting longer trucks than we have now. In fact, they are concerned about what we already have out there.

So it is a legitimate safety concern, as well as an infrastructure concern.

Mr. MINETA. All right. Thank you, Mr. O'Connell.

Mr. Hastert?

Mr. HASTERT. Thank you, Mr. Chairman.

Thank you, Mr. O'Connell, for appearing here today.

You indicate that current economic regulations create a barrier to direct relationships between shippers and owner-operators. What prevents owner-operators from obtaining their own authority?

Mr. O'CONNELL. Largely, a lack of knowledge of the industry and a lack of knowledge of how the process works. The independent owner-operators for a long time have leased their services to trucking companies and have not dealt directly with shippers and don't understand what is involved in the ICC application process. The process right now is actually streamlined to the point where it can be done by owner-operated. In fact, the ICC has kits that they put together that they circulate to truckers. It's just a matter of getting that information out.

We, as an organization, have done that, but the owner-operators are reluctant to do it themselves.

Another problem is interestingly addressed by your bill, Congressman. Owner-operators and small business truckers are disproportionately affected by conflicting State licensing and registration requirements. They pay the same cost to register and fill out a form as a large trucking company that registers 50 trucks on the same form. That permitting is now done by the companies that they are leased to. It's not as simple as just getting their ICC authority. They have to purchase their insurance; they have to get involved in the permitting process themselves, rather than having that done for them.

Now, if the ICC barrier were eliminated, I think a lot of them would take the other steps and would obtain authority for themselves. The ICC barrier is a major hurdle that you have to overcome before you can even get to the point where you're talking about the State licensing and permitting.

But those are the primary barriers: the lack of knowledge of the ICC regulations and what it takes to get operating authority and what they need, and I would say that an extremely high hurdle is the State registration requirement.

Mr. HASTERT. One of the real questions—and I'm creating a fault here and asking questions because I don't know what your answer is going to be to this—but there has been criticism of further deregulation in safety. How do you see that or perceive it? Is there?

Mr. O'CONNELL. As I said earlier, our organization supports highway safety because we have the greatest stake in it. Owner-operators spend 300 days per year, day and night, on the highway.

But safety policy has run somewhat amok at the Federal level. The short answer is that deregulation is probably not causing a degradation in safety if the federal government watches what it is doing and it sanely applies programs such as the Motor Carrier Safety Assistance Program, roadside inspections, that sort of thing—but they have to be sanely applied. There has to be a consensus among truckers and the enforcement community that what happens on the side of the road when you get stopped makes sense, and that it's not a revenue measure and it's not a shakedown. If that's the case, then there would not be an adverse safety impact from further deregulation. If it is not the case, then you have no effective safety enforcement at all.

Rates right now in the truckload industry are such that it is really not an economically regulated industry. The cost of operating a truck is about a dollar a mile, and there are trucking companies that are hauling freight on what they call "weekend specials," from Friday at noon until Sunday, hauling west out of the east coast for $0.59 a mile. So if the question is, is economic regulation keeping rates high enough to support safety which is the theory no, it is not.

Mr. HASTERT. You expressed before, on a question from the chairman, about increasing truck size and weight. What is the impact on your owner-operators if they have to buy bigger trailers and bigger trucks to be competitive? Will there be an economic impact there?

Mr. O'CONNELL. There could be some impact, although most of them, just because of the general demands of the industry that they operate in, have already reequipped with the larger equipment that has been permitted recently. In some cases they would have to invest in equipment, but that would not be a major consideration for most owner-operators. They would be operating with truckload carriers that are primarily running single truck operations.

Mr. HASTERT. You have stressed that increased uniformity and reasonableness, as you put it, should be required by Congress in the Motor Carrier Safety Assistance Program. Can you suggest specific guidelines that the Congress should require of the States?

Mr. O'CONNELL. In the MCSAP, I think that streamlining some of the Federal safety regulations that literally dictate the thickness of the mattress, the opening of the entrance to the bunk, and regulations that have evolved for God knows what reason over the years, and bringing that package under control would be very desirable. We should all agree on what critical items are necessary to ensure safety. The Commercial Vehicle Safety Alliance is an organization that has done that, and it has come up with what are known as "out-of-service criteria" to place trucks out of service where they present an immediate danger in safety. That that type

of uniformity should be supported. As an organization we strongly favor that and strongly support CVSA.

Another thing that should be addressed, although I'm not sure that it can be addressed in this reauthorization of MCSAP, is the current fine structure. We must eliminate $2,500 tickets for paperwork violations, because among drivers they do simply breed contempt for enforcement. You're not punishing the drivers, you're simply turning safety into a cat-and-mouse game where the drivers evade the checkpoints. They will go to the checkpoints to have their trucks inspected if they believe that there's a benefit to doing so. They will not go there if they believe that the State is simply interested in raising revenue.

If I may just elaborate a little bit more, the Tennessee Public Service Commission's Chairman is publicly chastising truckers every week because he is "fighting the good war against trucks." He is randomly stopping and inspecting trucks on the side of the road, going into the drivers' sleeping compartments, emptying their suitcases on their beds, and looking for drugs and alcohol without probably cause. OOIDA will challenge that practice—I believe the suit will be filed tomorrow, and if not, it will be filed on Monday. That sort of practice is condemned by the highway safety enforcement community throughout the country. But the lee-way that currently exists in the safety programs that allow that sort of practice is causing a great backlash among truck drivers.

Mr. HASTERT. From all reports, the truck industry has used both legal and legislative channels to fight discriminatory State taxation. Has there been any significant improvement in the procedural uniformity?

Mr. O'CONNELL. There has been some movement in that direction, but the movement that I am aware of has been over 10 or 12 years. It predates my tenure in the trucking industry. Movement has been slow, and the discriminatory taxes are still there. The States are getting very clever in their efforts to come up with new taxes post the Flat Tax decision of the U.S. Supreme Court. We are now looking at heavy enforcement of property taxes and income taxes on truckers. The State of Ohio, I believe it is, has a property tax that they have begun to impose on truckers. There is an internal memorandum that was furnished to us that actually states—I would be pleased to provide this—that this new tax creates a great new revenue opportunity for Ohio. The law has been on the books for eight years, and Ohio finally decided on how they could impose that tax on trucks.

Mr. HASTERT. So in the consensus of your Association, then, you would support even some type of preemptive type of legislation that says there would have to be a uniform type of taxation, probably one-stop taxation and registration issues?

Mr. O'CONNELL. Absolutely.

Mr. HASTERT. Fine. Thank you very much.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Lewis?

Mr. LEWIS. No questions, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. O'Connell. We appreciate very much your being here and submitting testimony.

[Mr. O'Connell's prepared statement appears on page 914.]

Mr. MINETA. At this time I would like to call on Robert G. Bartlett, Immediate Past Chairman of the Construction Industry Materials and Services Suppliers Coalition, and William J. Grayson, Jr., Chairman of the National Stone Association, accompanied by Val Riva, Vice President of Government Affairs of the National Stone Association.

We have your testimony and we will go ahead and make it a part of the record, so you may proceed, Mr. Bartlett.

TESTIMONY OF ROBERT G. BARTLETT, IMMEDIATE PAST CHAIRMAN, THE CONSTRUCTION INDUSTRY MATERIALS AND SERVICES SUPPLIERS COALITION, AND PRESIDENT, NATIONAL STONE ASSOCIATION, ACCOMPANIED BY WILLIAM J. GRAYSON, JR., CHAIRMAN, NATIONAL STONE ASSOCIATION, AND PRESIDENT, VULCAN MATERIALS COMPANY; AND VALENTINE RIVA, VICE PRESIDENT FOR GOVERNMENT AFFAIRS, NATIONAL STONE ASSOCIATION

Mr. BARTLETT. Thank you, Mr. Chairman. It is a privilege to be here, Congressman Lewis, Congressman Hastert, Mr. House, Ms. Elliot. I would say that in the interest of time you have our statement, sir, and I would like to just summarize the salient features and then, as indicated previously, have my colleague, Mr. Grayson, also provide testimony.

My name is Bob Bartlett. I am the President of the National Stone Association and the Immediate Past Chairman of the Construction Industry Materials and Services Suppliers Coalition. Mr. Grayson is the Executive Vice President of Vulcan Materials Company, the leading producer of crushed stone in the United States, with operations, I might add, in the greater Atlanta area, in Illinois, but unfortunately not in the city of San Jose—not yet, anyway, Mr. Chairman.

With me also is Mr. Valentine Riva, the Vice President for Government Affairs for the National Stone Association.

Mr. Chairman, it is a pleasure to be here and to provide testimony in your deliberations regarding the future of the highway program on behalf of the Coalition of Construction Industry Suppliers, called CIMSSC. This organization is made up of 15 associations: the American Coal Ash Association, American Concrete Pipe, American Consulting Engineers Council, the Asphalt Institute, Associated Equipment Distributors, National Aggregates Association, National Asphalt Pavement Association, National Corrugated Steel Pipe, National Lime Association, National Ready Mixed Concrete Association, National Slag Association, National Stone Association, Portland Cement Association, the Wire Reinforcement Institute, and the Construction Action Council of the United States Chamber of Commerce.

Many of these organizations compete in their daily activities, but we are unified in providing this testimony because of our concern about the future of America, its infrastructure, its highways and bridges, and what we do about it in the coming decade. For that, we are privileged and pleased to provide this testimony.

We have a perspective of a broad industry which represents every corner of this country, from small family-owned operations to

large publicly-traded corporations. Our total industry is represented by some 700,000 employees. Our dependence on the transportation system of this country is indicated not only by our employees using roads and streets daily to commute to work, to do their shopping, enjoy the leisure and recreational opportunities, and to attend school, but in addition, the bulk of our products are shipped to consumers and to our construction projects by the transportation system of this country. And then finally, we are in a position where we are alert to the roads and the infrastructure because we assist in providing materials that are being incorporated into these construction projects and therefore we see it from a user perspective, as well as a builder point of view.

In short, our testimony focuses on what can be and ought to be America's competitive edge in the future. Much has been said about this and many reports have been written. Indeed, the Bush Administration's NTP on Moving America addresses the point, as has been testified to previously today, about the need to keep America moving in this economic area. Many economists have testified to that fact. In addition, the Nobel Prize Award-winning economist, Dr. James Tobin of Yale University, has testified that the infrastructure problems of this country represent the third deficit, the first being the governmental fiscal deficit, the second being the trade deficit, and the third being the infrastructure deficit that we need to redress if we're going to prepare for the coming decade.

Many reports have been submitted—the National Council of Public Works, this subcommittee, AASHTO, and the list goes on—addressing and identifying the deficits that exist in this country regarding roads and bridges. We would concur with the AASHTO recommendations that we must get to a level of Federal involvement in the order of $18 billion by fiscal year 1992, growing to some $26 billion in fiscal year 1995, if we are to achieve the generally accepted level of $100 billion investment—investment—in America's infrastructure.

We are also well aware that in order to do this, there are resources that must be applied. We feel it is a shame that the Highway Trust Fund has been permitted to build up to in excess of $10.2 billion of your tax money and ours that has not been used for its intended purpose. We would therefore encourage an accelerated spend-down of the Highway Trust Fund so that these dollars can be used for not only their intended purpose, but for the demonstrated need that exists.

Second, we believe that there is a necessity in the coming period over which this long-range program you are considering will cover, to increase user fees. In fact, we recognize that the most equitable way is to continue the principle that those people and vehicles that use the transportation system ought to pay their equitable share for its construction and upkeep.

We also believe that there are certain other funding limitations, such as the gasohol exemption. While we might agree with the laudable objectives of the gasohol exemption, we don't feel that it should in essence divert funds from the Highway Trust Fund so that those people using the gasohol exemption who are using the highway don't pay their equitable share for its construction and upkeep.

We also believe that technology plays a great role in the future to ensure that the dollars that we spend in our Nation's important public works programs are well placed and well invested. As an industry, we encourage greater research and development for better materials, for better designs, for improved construction procedures and practices. As a matter of fact we are proud as one association, National Stone Association, to be participating with the highly-recognized National Strategic Highway Research Program, SHARP, by providing 11 quarry access roads as part of their testing program so that different climates, different uses, and different criteria and parameters can be explored with industry cooperation to the researchers in order to assure that the American taxpayer is getting full measure of value for the invested funds.

Mr. Chairman, we believe that there is an exciting future for all of us out ahead. While we may be a basic material and a building block, we believe that it is the future of this country to provide the kind of support and the infrastructure basis on which to maintain not only the worldwide competitive edge, but also to provide for the quality of life that is so characteristically American.

Now I would like to introduce our Chairman of the Board of National Stone Association, as I indicated previously, the Executive Vice President of Vulcan Materials, Mr. William J. Grayson, Jr.

Bill?

Mr. GRAYSON. Thank you, Bob.

Mr. Chairman, subcommittee members, staff, it is indeed a pleasure for me to be here with you this afternoon and I appreciate the invitation to express our views.

The National Stone Association represents 461 firms that produce crushed stone or manufacture equipment for use in such operations. The crushed stone produced by NSA members is a basic material in building the Nation's highways, airports, and other vital components of our infrastructure. A substantial portion of the crushed stone that is produced by our members is also used for agricultural and chemical purposes, erosion and sedimentation control, railroad ballast, and a multitude of environmental projects. Stone indeed is a ubiquitous, unique, and fundamental natural resource.

I would like to take this opportunity on behalf of NSA's entire membership to commend this subcommittee for the leadership it has shown in forcefully advocating the need to improve the roads and bridges that constitute the Federal-aid Highway System. It has not been an easy task, I can appreciate that, especially in a time of budgetary concerns that loom large over all the domestic programs, but it is clear that without the leadership of this subcommittee, the prospects for devising an efficient Federal Highway System in the post-1991 period would certainly be less bright, to say the least.

Mr. Chairman, I am well aware that the subcommittee has a tight schedule, so I will keep my comments and suggestions brief.

The American Association of State Highway and Transportation Officials, or AASHTO, in their excellent report, New Transportation Concepts for a New Century, states that in 1988 "Americans traveled 2 trillion vehicle miles by auto, truck, bus, and public transit, more than triple the national average of 1956, when the Interstate Defense Highway System was begun." As further noted

in the report, the total travel by these modes of transportation will again double, after having tripled from 1956 until now. They will double again by the year 2020.

If the report makes one thing perfectly clear, it is this: the $66 billion spent in 1987 by local, State, and Federal Governments will no longer be sufficient if we are to make a serious effort to remain competitive in the global market. Americans are blessed with a built-in competitive advantage that exists in no other market of our size. In contrast to Europe, for example, we have one currency, one language, and what up to now has been a transportation system that literally has been the envy of the entire world. I, for one, would hate to see the deterioration of this last component be the thing that makes us lose our competitive edge.

The basic objectives of the Federal-aid Highway Program were to provide users of the highway system access to trade and travel opportunities. For the most part, this has been accomplished through the development of the Interstate, primary, secondary, and urban systems, and other programs that foster highway safety, bridge improvements, and research and development.

Congress further envisioned that the Interstate System would be completed in 1991, and anticipated no further funding for additional construction beyond that year. Yet the AASHTO report cited above and other studies have shown that segments of the Interstate and primary systems have reached the end of their design life and must now be replaced.

Urban congestion, deteriorating and inadequate bridges, and the need for additional capacity in both urban and rural areas warrant continued Federal support of our Nation's highway and bridge network. In fact, this was brought home to me recently when I learned that the Federal Highway Administration has rated 60 percent of our roads as substandard, and 42 percent of our bridges as structurally deficient or functionally obsolete.

Making the system functional and making the system adequate will require a guaranteed source of funding such as that provided by the Highway Trust Fund. Much of this can readily be accomplished. For example, I strongly believe that the Highway Trust Fund should be drawn down to the extent permitted by law to meet these demonstrated needs and protect public safety. Although this will not take the place of additional revenue needs in excess of the Federal spending levels of $13 billion to $13.5 billion per year, it would be an important first step in ensuring that the needed improvements can be made.

Unfortunately, there is a current unexpended $10.248 billion balance in dedicated user fees being held hostage in the highway account of the Highway Trust Fund. This continuing build-up of $1 billion to $2 billion in unspent Highway Trust Fund balances is simply without justification in view of the documented needs for road and bridge construction and repairs.

To this end, I would note that AASHTO recently recommended increasing the annual Federal Highway Program funding levels from $18 billion to ultimately $26 billion over the life of the next Highway Program.

Mr. Chairman, NSA wholeheartedly supports AASHTO's recommended funding levels for the post-1991 Federal Highway Program

and believes, as does AASHTO, that these recommended funding levels represent a conservative estimate of the amounts needed to fund the documented needs.

I would also add that the overall annual investment by Federal, State, and local entities in highway construction and maintenance must achieve the $100 billion per year level widely recognized as the minimum future program necessary for the country.

In addition to drawing down the Highway Trust Fund balance, it is clear that additional funding will be required to meet the projected need for capital improvements and repairs. To this end, we believe that a significant increase in the motor fuels user fee is warranted in order to finance these improvements. We are firmly convinced that the users of our highway system are willing to accept the highway user fees in return for an adequate system that will enable us to be fully competitive in the world market. In fact, at the 1989 meeting of the U.S. Chamber of Commerce more than 80 percent of the participants stated that they would support highway user fees if they were earmarked for transportation improvements.

NSA also believes that the current $0.06 Federal excise tax exemption for gasohol fuels should be eliminated. According to the Federal Highway Administration this tax exemption costs the Highway Trust Fund more than $500 million annually, even though vehicles powered by these alternative fuels inflict the same damage on roadways as vehicles using gasoline.

In light of legislative proposals pending before Congress that would mandate the use of alternate fuels in certain areas, it is essential that this tax subsidy should be repealed in order to avoid a further drain on highway funding. If it is the wish of Congress to provide this exemption, it should come from general fund revenues and not from dedicated highway user fees.

The unexpended total of the highway account of the Highway Trust Fund balance now exceeds $10.25 billion, all of it in gasoline tax revenues and other user fees that you and I and every motorist pay for the privilege of driving over our roads and bridges. The dollars are piling up, being held hostage because the Highway Trust Fund remains a part of the Federal unified budget. To spend them in effect would make the Federal deficit appear greater than it is now, just as not spending the money makes the deficit appear smaller than it is. This is nothing but an illusion.

Our Federal budget deficit is a major problem, but we must call a halt to this acrobatic accounting process when it comes to the Highway Trust Fund. We must insist that your dollars, my dollars, and those of every motorist be spent on fixing up the roads and bridges in the name of mobility, safety, and economic well-being.

NSA therefore believes that the Highway Trust Fund should be removed from the Federal unified budget and that the programs financed by the fund should be exempt from any across-the-board spending cuts required under the Balanced Budget and Emergency Deficit Control Act of 1985.

We also believe that highway projects should not be put on hold because of policies concerning air quality, speed limits, and other matters that have no material connection with the program. Moreover, we recommend that Congress abolish the use of obligation

limitations or ceilings which serve no purpose other than to artificially limit the availability of funds for much needed road and bridge projects by indirectly controlling the level of cash outlays. In fact, I fail to comprehend why the funding for fiscal year 1991 is not based on expected user fee revenues in that year, which are expected to exceed $15 billion.

Mr. Chairman, NSA applauds the initiative taken by the Administration in developing a comprehensive proposal which recognizes the pressing need to revitalize the Nation's transportation infrastructure. As the drafters of the DOT report, Moving America, so eloquently state, "The Nation's vitality has always been linked to mobility. Transportation is an engine for economic growth and a link between the regions and the business people of this Nation and the world. Americans have moved farther, gone faster, and made more progress as a Nation than any other society in history. As we enter the 21st century, our transportation system, the symbol of that movement, will drive our growth and signal our success in forging solutions to the social and economic challenges we face. Transportation will be tomorrow, as it has always been in the past, integral not only to the way we live but also to building a better America for the future."

Mr. Chairman, DOT's report clearly makes the case for revitalizing the Nation's ailing transportation infrastructure. However, I am sad to say that it does not provide the Federal leadership required to provide the wherewithal for meeting its stated goals and objectives. This is all the more disappointing because it fails to recommend an immediate spend-down of the sizeable balance in the Highway Trust Fund and to match obligation levels to projected revenue in order to allow much-needed road and bridge projects to go forward. We hope everyone will soon come to the full realization that the post-1991 Federal-aid Highway Program must be adequately financed, even if it means upsetting those architects of the unified budget who would rather have the Highway Trust Fund be used to mask the Federal deficit than to allow it to be used to finance the very projects that ultimately can only serve to promote the continued growth of the Nation's economy.

The bottom line is that with our overwhelming road and bridge improvement needs, we can no longer ignore the fact that we must spend the dedicated user fees that have been collected for this very purpose, increase the revenue to meet those needs, and put aside any thought of continuing to subsidize extraneous programs, such as the exemption provided for gasohol.

Mr. Chairman, this concludes my remarks. Thank you for the opportunity to appear here before you this afternoon, and I would be pleased now to answer any questions that you or other members of your subcommittee may have.

Mr. MINETA. Great. Thank you very much, Mr. Grayson and Mr. Bartlett, for your thorough testimony.

Mr. Bartlett, I would like to ask you about your testimony. You state that "optimum use of highway user fees should be emphasized through the application of life cycle cost analysis." I'm wondering if you could explain to the committee the benefits of life cycle cost analysis.

Mr. BARTLETT. There was an example of a demonstration project, Mr. Chairman, in the Pennsylvania district of your colleague, Congressman Shuster, where one of the aspects of the road construction, as an example, was Portland Cement and concrete paved shoulders. Now, there was initially more cost, but over the longer term less maintenance was required or is anticipated to be required on that.

So by putting in additional dollars in the initial construction to reduce the long-term maintenance costs, life cycle costing would be a savings.

In addition, the type of material and the size of aggregate used in flexible pavements is a factor. By spending more for thicker, deeper, better designed pavements we won't get the rutting and shoving and pushing characteristics that mean that pavement has to be repaired and replace more quickly than normal.

Mr. Chairman, we believe that there are some things that should be done in order to provide better overall long-term investments, and as an industry we endorse that principle.

Mr. MINETA. Let me ask about that shoulder. Is that what I've heard referred to as the "French drain"? Is that something different?

Mr. BARTLETT. No, sir. When you talk about a "French drain" you talk about a ditch that has been excavated and stone placed in it so that there is a porosity or openings between the stones so that water can flow through it——

Mr. MINETA. What is it doing? Draining it from the center of the pavement to the sides?

Mr. BARTLETT. Precisely. You have what is known as a drainable base course of material so that the water coming down seeps down, and then out to the side into the drainage ditches that parallel the roadway. Now, that would be a French drain concept.

The Portland Cement concrete shoulder that is part of the Shuster Highway, as it were, Route 220 south of Altoona, has a Portland Cement paved shoulder which should last over a much longer period of time.

Mr. MINETA. The roadway may be asphalt or concrete?

Mr. BARTLETT. It could be, or the shoulder would have been asphaltic or stone chip in other days, but this was a design that was incorporated in this particular project.

Mr. MINETA. For all too long the Nation has not focused on the use of innovative technology in the design and construction of public facilities. What new innovations in use of materials and construction techniques are now being applied in the construction of highway systems?

Mr. Grayson?

Mr. GRAYSON. Well, there is a lot of applied research going on in that area, Mr. Chairman, such as the use of larger sized aggregates to prevent rutting, for example, in flexible pavement; the use of thicker crushed stone bases in order to make the highways more durable for longer periods of time. There is quite a bit of research going on in academia, much of which is being jointly sponsored by our National Stone Association, to get into applied research to make our highways last longer than ever before.

Mr. MINETA. Very well. Thank you very much.

Mr. Hastert?

Mr. HASTERT. To follow up on the question by the chairman, you talked about making these changes. What are the incentives? You talked about incentives to promote innovation in highway design and building. How would you structure such incentives?

Mr. BARTLETT. The examples of incentives are twofold. Number one is the opportunity for the contractor and the materials supplier to revise the specs, to revise the plans to come up with some innovation that would be cost-saving and would be a significant improvement. The contractor or the supplier ought to share in the lower cost of that particular innovation.

Second is time. We heard earlier today the plea of the City Engineer from Des Moines, Iowa about the 10- to 12-year life cycle of planning a project, from inception to completion. I think we ought to have incentives for the contractor to get it done quicker and better and get it open to public use and public benefit. If they do so, they should receive a portion of the value of the benefit for the early access to this needed facility.

Those are two examples that come to mind, Mr. Congressman.

Mr. HASTERT. Previously today we had testimony that said that if you add an extra inch of concrete, it is going to prolong the life of the highway and only adds 1 percent to the cost. Have you borne that out in your research? Is that accurate?

Mr. BARTLETT. Well, I haven't seen specific research on it, but we do know that——

Mr. HASTERT. I'm saying, is there cost-effectiveness in that?

Mr. BARTLETT. Without question, sir. You are improving the ride characteristics of the pavement. You are making it watertight so that it doesn't get into deterioration, and you're giving it greater structural rigidity so that it will last longer. It's a sound investment, rather than having the pavement fall apart in use prematurely that has to be totally replaced.

Mr. HASTERT. That sounds like my old legislative days when we were arguing whether it should be three-eights inch of asphalt or a half inch of cover.

Mr. BARTLETT. The bigger the better is our motto.

Mr. HASTERT. Right. I am sure.

You fellows really haven't beaten around the bush at all. I understand from your testimony you would just as soon see the Highway Trust Fund off budget?

Mr. BARTLETT. Correct.

Mr. HASTERT. For the record?

Mr. BARTLETT. Absolutely.

Mr. GRAYSON. Yes, sir.

Mr. HASTERT. All right. Thank you very much.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Lewis?

Mr. LEWIS. I have no questions, Mr. Chairman.

Mr. MINETA. All right. Well, again, Mr. Bartlett and Mr. Grayson, thank you very much for the testimony here. Mr. Riva, we always appreciate your counsel and your work with the committee.

So again, thank you very much for the testimony.

Mr. BARTLETT. Thank you very much, sir.

Mr. MINETA. You have hit a home run ball, and because of that we are going to take a seventh inning stretch at this point.

[Mr. Bartlett's prepared statement appears on page 733.]

[Mr. Grayson's prepared statement appears on page 880.]

[Recess.]

Mr. MINETA. This hearing will come back to order.

We will call now Mr. William H. Dempsey, President and Chief Executive Officer of the Association of American Railroads.

Mr. Dempsey, your statement will be made a part of the record, so you may proceed in your own fashion.

TESTIMONY OF WILLIAM H. DEMPSEY, PRESIDENT AND CHIEF EXECUTIVE OFFICER, ASSOCIATION OF AMERICAN RAILROADS, ACCOMPANIED BY L. LEE LANE, EXECUTIVE DIRECTOR, INTERMODAL POLICY DIVISION, ASSOCIATION OF AMERICAN RAILROADS

Mr. DEMPSEY. Thank you, Mr. Chairman. I will be accompanied in a minute by Mr. Lee Lane, who is the head of our Intermodal Transportation Policy Group at the AAR.

I am glad to be here to present the railroad industry's views on the single and very pressing concern that we have in terms of the upcoming 1991 highway reauthorization legislation. That concern, and I hope it is unfounded, is that the legislation might wind up increasing the Federal 80,000 pound weight limit. To the rail industry, that is quite literally a matter of life and death. Our studies, for example, indicate that had there been nationwide broad operation of 135,000-pound twin-48 combinations in 1986, we would have lost some 9 percent of our annual ton miles, but that wouldn't have been the worst result by far. We would have lost some 52 percent of our net operating revenue. That is obviously a prescription for disaster, for a return to the cascade of bankruptcies of the 1970s, and for a consequent and very, very sharp constriction of the rail system of the country and a much heavier burden upon those shippers that depend and must depend upon rail.

Now, the public shares our concern about longer, heavier trucks—for different reasons, of course, principally because of their concern over safety. We commissioned a study by the respected public opinion survey organization of Frederick/Schneiders, and they conducted that survey in January of this year. What it demonstrated was that 90 percent of those who were surveyed want to see truck lengths kept the same or reduced. Only 6 percent wanted to see longer trucks. As I say, safety is a matter of overriding public concern: 86 percent surveyed believed that longer trucks would be less safe than trucks on the road today, so they share the very same concern as was just expressed by the representative of the independent operators.

There is a basis for that concern. The 1985 FHWA study of a proposed national system of long combination vehicles concluded, "We simply do not know whether LCVs can be operated safely in general use."

The country, as you know better than I, faces a transportation crisis. The Interstate System is fortunately almost complete, because it is now beginning to fall apart. The requirements for in-

vestment in the highway infrastructure are high, extremely high. The rail system can provide a partial answer to that crisis because our infrastructure, in contrast, is in splendid condition. The mainline track system of the freight railroads in the United States is probably in the best condition that it has ever been in and, as Secretary Skinner pointed out, it is, in addition, greatly underutilized. We have a good deal of excess capacity that could be put to good public use. Now, I will return to this in a moment.

I agree with the trucking witness who said that it is no business of the Government to distort the marketplace one way or the other in order to shift freight among the modes. I say that to emphasize it. Nevertheless, to the extent that more freight is carried by the rail system rather than the highways, there would be significant public advantages. One would be, as I have indicated, safety. In terms of a comparison, the fatality rate in connection with rail transportation is about half that which is connected with motor carrier transportation.

Obviously, another would be congestion, a growing and alarming problem in the country.

Next, the railroads are about three times as fuel efficient as the motor carriers, and that then bears upon questions of energy conservation and pollution.

Finally, there is the cost associated with vehicles traveling upon roads that are in poor condition.

But we are hampered at the present time in our ability to make that contribution to the transportation problems of the United States by virtue of the fact that, as the most recent FHWA study indicated, the heavy trucks are not paying anything like their appropriate share of the direct highway costs associated with their operations. The last study indicated that as a group they were only paying about two-thirds of their appropriate share, and if one extrapolates to the motor carriers that are the heaviest and the most directly competitive with the railroads, we are looking at about a 50 percent underpayment by these trucks. That ratio does not take into account the so-called external costs of congestion and pollution and safety, for example, that Secretary Skinner indicated in his National Transportation Strategy should be calculated and should be assessed.

So what we are urging is that this imbalance, this present distortion of the marketplace, not be exacerbated as it would be so greatly by an increase in the Federal weight limits.

Mr. Chairman, one further thing. I would like to request that the public opinion survey that I referred to be made a part of the record.

That, then, concludes my comments.

Mr. MINETA. Thank you very much, Mr. Dempsey. That will be made a part of the record. (See page 771.)

The Federal Highway Administration's 1985 study of a proposed national system of longer combination vehicles indicated that the Federal Highway Administration did not know whether LCVs or these longer combination vehicles, could be operated safely in general use. Does AAR have any information that would indicate that the use of LCVs would create a safety hazard on our Nation's highways?

Mr. DEMPSEY. I'm going to turn to Mr. Lane in a second, but I would like to make two comments about that in a general way.

The question, in the first place, is not necessarily whether LCVs can be operated as safely as other motor vehicles, although we think that the evidence indicates they cannot, and I think the testimony of the representative of the independent operators is strong evidence to that effect. The further question, though, is how many more motor carriers would be introduced upon the Nation's highway system by virtue of this enormous diversion of traffic from the rail system to the motor carriers. Because it is unquestioned that rail transportation is substantially safer than highway transportation. I don't say that in criticism in any way of the motor carrier industry. The fact of the matter, though, is that they operate in a much less controlled environment than the Nation's railroads do, so that the net adverse impact upon highway safety would be serious, even assuming arguendo that LCVs could be operated as safely as existing motor vehicles.

Lee, would you like to add to that?

Mr. MINETA. The recently-announced National Transportation Strategy supports intermodalism as a means to enhance the movement of people and goods. Can intermodalism work effectively between the railroad and the trucking industries?

Mr. DEMPSEY. Well, intermodalism is operating very effectively by virtue of cooperation between the motor carrier and rail industries. Intermodal traffic is far and away the fastest growing segment of rail transportation today and has been now for the past five or six years. It is now number two in terms of commodities or lines of rail traffic, and growing by leaps and bounds. It is an excellent development so far as we are concerned and so far as the motor carrier industry is concerned that participates with us.

Mr. MINETA. There was some reference to the cargo that comes off ships, the containerized cargo, and the whole issue of weights, who should really be looking at that and who do we look to to limit those. Do you have any thoughts on that, Mr. Dempsey?

Mr. DEMPSEY. I noted that with interest in Mr. Donohue's testimony. It is a matter that clearly is not within the control of the railroads, but I would be glad to inquire into that and report to you. It may very well be that we agree with much of what Mr. Donohue has to say on that subject.

[Information previously supplied.]

Mr. MINETA. Your statement focuses on this whole issue of whether or not there is any possibility that in the reauthorization legislation there would be any provision for increased truck weights from the Federal level. Again, looking at this from a narrow viewpoint, I am just wondering, does the AAR oppose the use of longer combination vehicles because it puts the railroad industry at a competitive disadvantage?

Mr. DEMPSEY. Yes. We have no question about that. As I indicated at the outset, it is not a modest encroachment that we would have. It would be an encroachment of something on the order of 50 percent of our net operating revenue.

Now, let me say that if that can be justified in terms of the economics of the marketplace, and that would require a full assessment of user charges against the heavy trucks, including social

costs, then we could scarcely be heard to complain. It is very evident that you would still hear protests of all sorts from the general public and from organizations that are concerned with such social questions as pollution and safety and congestion. But in those circumstances, I think it would not be appropriate for the railroad industry to complain because that would not be a distortion of the marketplace in economic terms. But there is that distortion now and the introduction of these vehicles would simply amplify it greatly.

Mr. MINETA. Very well. Thank you very much.

Mr. Hastert?

Mr. HASTERT. Thank you, Mr. Chairman.

Mr. Dempsey, we certainly appreciate your appearance here today and welcome you to this committee.

Mr. DEMPSEY. Thank you.

Mr. HASTERT. I am going to piggy-back off the chairman's questions, no pun intended.

We heard about the container weight problem that was in the testimony of a previous witness who said it was a problem for the trucking industry, that it was hard to refuse a package once it was there on the docks, etc. He also said that in the railroad industry if you don't know what those weights are and you simply have a container, it is dangerous when you stack a heavy on top of a light. Is that a problem?

Mr. DEMPSEY. I doubt it, Congressman Hastert. I really do. It's an operational question and, if it were a problem, I am pretty sure we would have heard about it at the AAR, and we simply haven't. So I am very skeptical that this is a problem that affects railroad safety, but I will investigate and I will report to the committee specifically on that question.

Mr. HASTERT. Thank you.

You said that you would submit the Frederick/Schneiders study?

Mr. DEMPSEY. Yes.

Mr. HASTERT. I think that's important. We would certainly like to take a look at it.

Both AASHTO and the National Transportation Policy recommend greater Federal investment in intermodal linkages. We talked a little bit about intermodal here, but how do you see it? What is your vision of being able to develop the facilities, the ship/train/truck/airport facilities that we need to be competitive in this country?

Mr. DEMPSEY. I am going to turn to Mr. Lane on that question because he is far more expert than I am.

Mr. LANE. Well, my impression is, Mr. Hastert, that there are some fairly severe local problems in a number of areas where there are large volumes particularly of international containers, but there are some inland examples of it too, where local highway facilities in particular are being stressed by the volume of intermodal container flows. Insofar as those highway facilities cause bottlenecks in the flow of those containers and trailers, that becomes a major barrier to the development of intermodal transportation.

Insofar as it is appropriate to concentrate highway improvements on those bottlenecks, obviously that would represent a potential solution or amelioration of the problems that currently exist.

Mr. HASTERT. I think maybe you missed the point of my question. I'm saying, do we need to make major investments, and should it be public or private, when you start to facilitate port unloading and railheads and trucking docks so that you can become truly intermodal in this economy?

Mr. LANE. I guess my reaction to that is to say that there is a great deal of that investment that is already being made under the existing institutional arrangements. As I say, that doesn't imply that there aren't some serious bottlenecks that need to be dealt with, but I'm not aware of our industry having a perceived need for a major public investment program in rail intermodal facilities.

Mr. DEMPSEY. I will again check back, but to seek public funds to invest in, let's say, rail facilities would, in general, be in opposition to our overall policy which says, in effect, that there should be no subsidies to any mode of transportation, except in emergencies of one sort or another.

So I would be skeptical that we would be in favor of Federal assistance to either the trucking mode or the shipping mode, although I must say that I haven't thought about it and I'm not clear on my answer.

Mr. HASTERT. The Federal Highway Crossing Program is authorized at a level of $160 million for fiscal year 1990. What is the position of your Association? Do you support the extension of this program, more or less? How do you feel about it?

Mr. DEMPSEY. Well, it has been one of the most successful programs in our experience. We do regard that as essentially a highway problem, and therefore we think that there it is entirely appropriate for the Federal Government to provide those monies.

Therefore we would like two things: one, to keep it a categorical grant, because our experience has been that if the States have flexibility in using that money for different purposes, they are very likely to do so, and that shouldn't be done, as I say, because this program has been so terribly successful in reducing grade crossing accidents, which is far and away our number one safety problem.

Secondly, it ought to be kept at least at current levels. That would be my personal view about it.

Mr. HASTERT. What is your view or vision when we start to work on this highway bill and transportation bill as far as grade separations? One of the things that we deal in my district, I am crisscrossed with about seven different railroads, large and small. A lot of the grade separations go back literally to the 1880s and 1890s, and it is a real problem. Today it is $3 million or $4 million to do that type of work.

Should there be some cooperative effort, or should it be the responsibility of the Highway Trust Fund, to start to focus in on those problems and actually create new grade separations?

Mr. DEMPSEY. Yes, I think so. I think it falls in the same category in terms of responsibility as the Grade Crossing Protection Program. You can't have anything more successful at preventing crossing accidents than separation. So while it is expensive, it is also very, very effective. Again, the railroads by and large were there first, so we regard it as a highway program responsibility. I don't mean a truck responsibility, but a highway program responsibility.

Mr. HASTERT. Well, thank you, Mr. Dempsey. The hour is late this afternoon. I could probably extend this question and answer period, but we won't. I appreciate your being here. Thank you very much.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Lewis?

Mr. LEWIS. Thank you, Mr. Chairman.

Mr. Dempsey, in my district, the city of Atlanta, we have substantial piggy-back facilities. What impact would increasing the weight limit have on piggy-back facilities?

Mr. DEMPSEY. That's a very good question, Congressman, and I'm very glad you asked it.

What would happen——

Mr. LEWIS. We should have more piggy-backs?

Mr. DEMPSEY. Piggy-back, as I have indicated, is very promising. It's our number two line of commodities now. It does take advantage of the long haul efficiencies of the rail system and the short haul efficiencies of the motor carrier system and the delivery advantages of the motor carrier system. And you have seen down there how many trucks it takes off the highway. So it deals, then, with the safety problems and with pollution problems and with congestion.

In my judgment and the judgment of others in the industry with whom I have spoken, the broad-scale introduction of twin-48s would just about wipe out the piggy-back element of rail freight transportation. The reason is that as a category, it is the least profitable form of rail freight transportation. It is close to marginal. Therefore, when you take 52 percent of the net operating profit of the railroads away, what you're going to find is that you are going to try to restrict your operations to only those operations that are pretty good in terms of profitability. I'm talking now about coal and I'm talking about ores and those sorts of things, and the margins would just go.

Now, the first order of destruction of rail freight transportation, in my judgment, would be piggy-back.

Mr. Lane, do you want to comment?

Mr. LANE. Well, piggy-back is really a business which is dominated by volumes. It really does benefit as volume increases because you've got those very large terminal facilities through which you've got to run a large volume of traffic in order to keep the facility viable.

For that reason in particular the point that Mr. Dempsey makes applies especially to piggy-back. If you lose 20 or 25 percent of the volume of piggy-back as a first order effect of legalizing twin-48s, which is what our research indicates would happen, the facilities that are left just aren't economically viable with the remaining 75 percent of the traffic. We have had very senior executives from major railroads say that if twin-48s are legalized, they will simply get out of the piggy-back business and out of the intermodal business as a whole, lock, stock and barrel. I sincerely believe that that's true just because the remaining volumes will not be sufficient to justify the continuation of an intermodal system, which is very capital-intensive.

Mr. LEWIS. Thank you very much.

Thank you, Mr. Chairman.

Mr. MINETA. Well, thank you very much, Mr. Dempsey and Mr. Lane, for being with us and for your testimony here today.

Mr. DEMPSEY. Thank you, Mr. Chairman and members of the committee.

Mr. LANE. Thank you.

[Mr. Dempsey's prepared statement and policy paper appears beginning on pages 751, 771.]

Mr. MINETA. At this time I would like to call on Mr. George Berg, Assistant Director of National Affairs, American Farm Bureau Federation.

Mr. Berg, we have your statement. It will be made a part of the record, so you may proceed in your own fashion.

TESTIMONY OF GEORGE BERG, ASSISTANT DIRECTOR OF NATIONAL AFFAIRS, AMERICAN FARM BUREAU FEDERATION

Mr. BERG. Thank you very much, Mr. Chairman. I will try to be as brief as possible.

My name is George Berg and I am an Assistant Director of the National Affairs Division of the American Farm Bureau Federation. Farm Bureau is the world's largest farm organization, representing 3.8 million member families throughout 50 States and Puerto Rico. We appreciate the opportunity to present our views on surface transportation programs which will be expiring at the end of fiscal year 1991.

In my full statement to the committee I have listed a number of highway transportation policies which were approved by our voting delegates at the annual meeting this past January. One of the policy positions I mentioned states that for purposes of maintaining primary and secondary roads, we support allowing more flexibility in the use of Federal highway construction funds at the State level when a State has completed 90 percent of its Interstate Highway System responsibility. Hopefully, this would earmark more funds that are desperately needed for the secondary highway and bridge program.

The secondary road system is in the poorest condition of all Federal-aid highway systems. Given its extent of 401,000 miles and its relatively high usage, it is not surprising that the secondary system has been unable to keep abreast of the other systems, particularly when other more heavily used roads are competing for scarce funds. According to the Federal Highway Administration, almost 40 percent of the secondary paved mileage either requires, or will shortly require, major capital improvements.

The agriculture industry depends on local road and bridge transportation. All highway studies have acknowledged the poor condition of local roads and bridges, but they have usually failed to recognize their economic importance to every citizen in the State. They are essential to agriculture, forestry, rural tourism, rural industries, rural living, essential services, and general State economic development. Rural roads and bridges are, indeed, a vital link to agricultural prosperity.

The supplies and equipment that our farmers use in producing their crops are all hauled by truck or by rail to the rural locations

where they are used. After the crops are harvested, all modes of transportation—truck, railroad, barge, and ocean vessel—are utilized to move the commodities to the people who want and need them. Modern agriculture also requires the use of heavy equipment and machinery which must travel on rural roads and bridges. Other industries have similar needs, but in agriculture any disruption of the transportation system is most certainly reflected in the prices that our farmers receive for their commodities.

Farmers also recognize that we have a substantial bridge problem in the United States. Bridges help maintain the vital transportation services that are necessary for agriculture and rural development. Bridges allow vehicles to move with ease across this country. They allow cities to function and make truck transportation feasible. They permit farmers to move modern equipment to their fields and transport their products from the field to the marketplace.

We in agriculture are proud of the fact that we have the most productive and most efficient system of agricultural production to be found anywhere. We are reminded, however, that all of that production on our farms and ranches is of little value if we are unable to move it to market in a timely, economical, and efficient manner. Agriculture is unique from many other industries due to its low density population, geographic features, and highway patterns. The sudden loss of a bridge on a primary or secondary road would have a serious impact on farm economy and rural communities in general. A section of highway can be poor but still serviceable, but the loss of a bridge can cause long-term disruption to the transportation of agricultural commodities. This is why we believe that providing adequate highways and bridge facilities is a proper role of Government at all levels.

In summary, Mr. Chairman, we hope that the reauthorization of the post-interstate surface transportation program will recognize that millions of Americans living on farms, ranches, and in rural communities must have access to major highways. Rural roads are essential to the safe, efficient, and economical transportation of food products from farms and ranches to consumers everywhere. In view of the fact that the Interstate Highway System is nearing completion and the secondary road system has been neglected for many years, we believe it is time that Congress recognized the importance of these farm-to-market roads and bridges and authorize a realistic increase in this category of roads. In reauthorizing funds for the rural secondary highway system, Farm Bureau recommends a $4 billion appropriation annually.

The basic dilemma that confronts the bridge situation is how to replace or rehabilitate as many bridges as possible with the limited funds available. The General Accounting Office found that costs to replace a given bridge can vary by thousands of dollars, depending on which State the bridge is in, who is paying for its replacement, and who makes the decisions on its design and construction. Some of these cost differences are due to varying climate, terrain, and methodology. Different policies at the local, State, and Federal levels are also major factors. In rural America, we feel that the timber bridge program promoted by the USDA Office of Transportation provides an effective, low-cost method of replacing many

rural bridges. Because bridges are vital to all road systems, Farm Bureau recommends $4 billion annually, which we also believe is realistic.

Again, we thank you and the members of the subcommittee for the opportunity to present our views. I would be happy to answer any questions, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Berg.

The Farm Bureau Federation has proposed funding levels for several Federal-aid highway programs that you've mentioned—Interstate 4-R, primary roads, secondary roads, bridges. Are there other Federal-aid highway programs that the Federation would support funding?

Mr. BERG. Oh, yes, Mr. Chairman. We do favor completion of the Interstate Highway System. We certainly are in favor of improving and maintaining the primary system, and an adequate highway system for the Nation.

Mr. MINETA. The Federation is not recommending any increase in user fees?

Mr. BERG. No, sir, we are not.

Mr. MINETA. Would the requested authorization levels of $4 billion for the secondary roads and $4 billion for the bridge program adversely affect the ability of the States to fund other Federal-aid highway programs?

Mr. BERG. Well, Mr. Chairman, the balance in the Highway Trust Fund is anywhere from $12 billion to $18 billion. I don't think anybody in this room who has testified can really tell you how much is in there. But we feel that the $4 billion can be drawn down from that Highway Trust Fund. As I said in my statement, the Interstate Highway System is nearing completion. There are only 300 or 400 more miles to go on it. Frankly, I don't think those miles will ever be built because they are in too high-cost areas to be completed.

So I think some of this money, could be used to improve the rural road and bridge program in this country. There could also be Interstate connecting roads, and that is what we need more than anything else right now, roads that will connect rural America to the Interstate Highway System.

Mr. MINETA. During consideration of the surface transportation reauthorization legislation the committee will establish the Federal role for the Nation's transportation system. What is the significance of a Federal role for a secondary system and for off-system bridges?

Mr. BERG. What is the significance?

Mr. MINETA. Is there a Federal role for those secondary roads and for the off-system bridges, especially when you talk about timber bridges? That would be categorized as an off-system bridge, and I believe that under the present law it is something like no less than 10 percent but no more than 35 percent that can be spent on that off-system bridge program.

Mr. BERG. Well, we would favor anything along that line on an off-system timber bridge because, Mr. Chairman, this has been a very successful cost-sharing plan of the Forestry Service in the Department of Agriculture. In the last two years, I think in 1988 and 1989, they received $2.7 million for their bridge program, and they

have built 130 bridges throughout the country. Some of these bridges are significant. They are 24 x 100 feet long and it only cost about $147,000 to build the one south of Fort Collins, Colorado.

So I think that more consideration should be given to this program, and maybe it's time the Department of Transportation started to talk to the Forestry Service to find out how successful they have been.

We're not asking for Interstate-type bridges in rural America. We're simply asking for bridges that will get us across creeks and small rivers and culverts, and this timber bridge program can be very effective.

Mr. MINETA. I guess that's part of the question, though. What would be the national significance, from a national public policy perspective? Let's say, why would the Highway Trust Fund monies be used for a timber bridge on an off-system road?

Mr. BERG. Well, to promote the highway program. To give us the roads that will connect us to the Interstate Highway System and the primary system, the Federal-aid Interstate and the Federal primary system. That's what I would say would be the national interest. We need these highways to get our agricultural products to the market and to international markets.

Mr. MINETA. But we also have, in effect, the farm-to-market road system. We have the forestry road system. We have a lot of different specific categories of road programs.

Mr. BERG. Yes, but they've all been neglected, and that's my point, Mr. Chairman. They have been neglected for several years because we've all waited patiently for the Interstate Highway System to be completed. I think we've waited 40 years now, and there's a great deal of concern out there—not only since the Secretary announced his new highway policy, but I've gone to seminars all over the country in the last four or five years and they are all complaining that the secondary road system, local roads, rural roads, whatever you want to refer to them as, are in a sad state of condition and repair.

Mr. MINETA. There's no question that you're correct, because when we look at how much has been put into the transportation infrastructure in the 1960s and the 1970s, we find that it averaged 2.3 percent of GNP, and in the 1980s that dropped to 0.4 percent. So I think that's reflected right there in that figure.

Thank you very much.

Mr. Hastert?

Mr. HASTERT. Thank you very much, Mr. Chairman. I am just getting a quick education on what a timber bridge is, here.

I represent a pretty large mixed urban, suburban, and rural area in northern Illinois. One of the troubles that we have in a farm community is getting a truck off the Interstate highway, where they can haul 80,000 pounds, and into the farmer's market area at least, if not the farmyard itself, to deliver those goods or to pick them up and get them on the Interstate.

Is this an area where you're talking about the timber bridges being useful?

Mr. BERG. Well, Congressman, from what I understand there are about 260,000 bridges in this country that are obsolete or structurally deficient, and most of those bridges are in rural areas. If there

is a bridge that these trucks can't pass over to get to an Interstate, certainly, that's the bridge I'm talking about.

Mr. HASTERT. Sixty percent of them in Illinois are in urban Chicago, but that's another problem.

Mr. BERG. Well, I'm not necessarily favoring a timber bridge on an Interstate Highway——

Mr. HASTERT. No, no. I know that. I'm not asking that. I'm saying that the purpose of these timber bridges, the shoring up of the highways that you have, is to get your 80,000-pound trucks off the highway in where the farm commodities can be either picked up or sold or delivered, is that correct?

Mr. BERG. Yes, sir.

Mr. HASTERT. Okay.

The second question I want to ask you, we had a lot of testimony in here this afternoon about the exemption of the tax on ethanol. This is a two-pronged question, what is your opinion of that, and second, what if in the clean air bill some magic happened and ethanol all of a sudden, or one of these magic fuels, clean fuels, if you will, become mandated by law and you have to use the 10 percent ethanol or methanol; then would you think that the exclusion on that tax should still continue, or it could be added on? Two questions.

Mr. BERG. I think that by the exclusion—you mean the exemption that we get for gasohol?

Mr. HASTERT. Yes.

Mr. BERG. I think it should be continued.

We publicly and enthusiastically favor the ethanol use to make gasohol because, number one, it reduces farm subsidies. It increases net farm income, but it also——

Mr. HASTERT. It creates a market?

Mr. BERG [continuing]. Creates a market, and therefore it would increase net farm income. But it also reduces our dependency on foreign oil. It provides clean air.

Mr. HASTERT. I understand that. So you think that as the stage is set now, as the economy is set now, as the laws are set, you favor the extension?

Mr. BERG. Yes, I do.

Mr. HASTERT. Okay. Then, the second part of the question: if an ethanol mix or a clean fuel mix became mandatory or mandated by law, do you think it's still necessary to keep the exemption there? The exemption is there to give a competitive advantage. If there's not any reason for a competitive advantage any more, if it's actually there because it's there, do you think we need to keep that exclusion? That's an important question because a lot of people ask that.

Mr. BERG. Well, I'm sure that it is. I don't think that we've given any thought to that. Our policy doesn't call for that because up until this point—we've been working on the Clean Air Act for 12 years or so and we haven't had to face that problem. If indeed it did, I think our leadership in the Farm Bureau would take another look at the exemption for gasahol.

Mr. HASTERT. I have corn growers in my district and it's an important issue, but it's an issue that ought to be thought about seri-

ously because it does hinge on what we can do in our transportation programs.

Mr. BERG. I can understand that, but I'm not at liberty to say what they would do.

Mr. HASTERT. In other words, you haven't thought that policy out yet?

Mr. BERG. No, they have not.

Mr. HASTERT. Okay.

The third question, and then I will let you go. What is your position on whether the Highway Trust Fund should be on budget or off budget?

Mr. BERG. Off budget. We favor taking the Highway Trust Fund out of the unified Federal budget.

Mr. HASTERT. Why?

Mr. BERG. It's in our policy.

Mr. HASTERT. Why?

Mr. BERG. Well, because we think it would give the Department of Transportation more flexibility to use the fund for purposes as they see fit. It wouldn't go toward keeping the deficit higher than it really should be.

Mr. HASTERT. Thank you, Mr. Berg.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Lewis?

Mr. LEWIS. No questions, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Berg, for your fine testimony here today.

Mr. BERG. Thank you, Mr. Chairman.

Mr. MINETA. Next we have a panel made up of Fran Pavley, a member of the City Council of Agoura Hills, California, and former Mayor, representing the National League of Cities; Mr. Ed McMahon, Executive Director, Scenic America; Dr. Charles Floyd, Professor of Real Estate, the University of Georgia, representing the American Planning Association; Paul Barkley, A.I.A., Barkley & Pierce Architects, Falls Church, Virginia, representing the American Institute of Architects; Phoebe Driscoll, Chairman of the National Affairs and Legislation Committee, Garden Club of America; and Elizabeth S. Merritt, Chief Litigation Counsel, National Trust for Historic Preservation.

[Mr. Berg's prepared statement appears on page 744.]

TESTIMONY OF HON. JOHN LEWIS, A REPRESENTATIVE FROM GEORGIA, ACCOMPANIED BY FRAN PAVELY, A MEMBER OF THE CITY COUNCIL OF AGOURA HILLS, CA, AND FORMER ED McMAHON, EXECUTIVE DIRECTIOR, SCENIC AMERICA; CHARLES FLOYD, PROFESSOR OF REAL ESTATE, UNIVERSITY OF GEORGIA, REPRESENTING AMERICAN PLANNING ASSOCIATION; PAUL BARKLEY, A.I.A. BARKLEY & PIERCE ARCHITECTS, REPRESENTING AMERICAN INSTITUTE OF ARCHITECTS; PHOEBE DRISCOLL, CHAIRMAN, NATIONAL AFFAIRS AND LEGISLATION COMMITTEE, GARDEN CLUB OF AMERICA; AND ELIZABETH S. MERRITT, CHIEF LITIGATION COUNSEL, NATIONAL TRUST FOR HISTORIC PRESERVATION

Mr. MINETA. So with this fine lineup of wonderful witnesses, I would like to turn first to our colleague from Georgia, Mr. Lewis.

Mr. LEWIS. Thank you very much, Mr. Chairman.

Mr. Chairman, I really would like to thank you for giving members of this coalition that is supporting H.R. 3389, the Billboard Control Act of 1989, the opportunity to come here so late in the afternoon, after you have spent all day—I know you must be tired; it has been a long day, and I'm going to make my statement brief and submit my complete statement for the record.

I'll tell you, Mr. Chairman, this is a dedicated group, really committed to putting an end to visual pollution along Federal highways. It is a large and diverse coalition. H.R. 3389 is a very important bill. It is going to put teeth back into the Highway Beautification Act. It's going to make our highways more scenic, it's going to make our highways more safe, it's going to improve the quality of life in rural, suburban, and urban communities throughout this country.

I know that the speakers who are here today are going to provide us with some very valuable information. They will tell us what the States would do to combat the billboard problem if they could, if the Federal Government would let them. They will tell us about some of the fallacious arguments that have been bantered about and the false information that is being passed around about the Billboard Act. And they will tell us what this bill means to historic preservationists, landscape architects, city planners, local and other political subdivisions throughout the country.

Mr. Chairman, I look forward to listening to these witnesses, and I want to welcome them here and thank you for making this opportunity possible.

[Mr. Lewis' prepared statement follows:]

STATEMENT BY CONGRESSMAN JOHN LEWIS BEFORE
THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
MARCH 15, 1990

Mr. Chairman, I applaud you for giving the members of the coalition supporting HR 3389, the Billboard Control Act of 1989, an opportunity to present testimony here today. I'll tell you, Mr. Chairman, this is a dedicated group, really committed to putting an end to visual pollution along federal highways. It's a large and very diverse coalition. I have worked closely with them and others in fashioning the "billboard bill."

Before we hear from them, I would like to say a few words about the bill. There are two provisions about which I want to say something. First, the reporting requirement. Second, the "just compensation" requirement.

By all accounts, no one knows how many billboards there are along federal highways. No one knows how many billboards comply with the Highway Beautification Act. And, no one knows how many do not comply with the Highway Beautification Act.

The Federal Highway Administration doesn't know.... The General Accounting Office doesn't know.... The states don't know... The only one who probably does know is the Outdoor Advertising Association. But, they won't let us know what they know!

The Congressional Research Service stated in a recent report that the quality of the data which does exist is considered "suspect."

How can the U.S. Department of Transportation regulate outdoor advertising --- as the Congress has required it to do --- unless it knows what's out there?!

We need to know how many billboards there are along federal highways? How many of them are "conforming?" How many of them are "nonconforming?"

So, my bill calls for an annual report about the numbers of billboards. This report is to be prepared by the U.S. Department of Transportation based on inventories prepared by the states.

Before I get to the "just compensation" issue, let me say a few things about the Highway Beautification Act and the changes it has undergone since 1965. The 1965 Act established a national program and policy for the control of billboards. The purpose of the legislation was to provide for "scenic development and road beautification" along federal highways. It was to protect our tremendous investment in our highway system. And, it was to promote the safety of our highways.

By most accounts, the Highway Beautification Act has been a failure. Why? Because of a 1978 amendment which made it impossible for states to compensate billboard owners for the removal of their "nonconforming" billboards.

Prior to 1978, states could compensate billboard owners for the removal of their signs without paying cash. The 1978 amendment required that the states compensate them with cash.

So, the states were put between a rock and a hard place: They were required by the Highway Beautification Act to remove billboards which did not conform with the requirements of the Act. They were prohibited from removing "nonconforming" billboards unless they paid cash to the billboard owners. The U.S. Department of Transportation, which was to pay 75% of the cash compensation, didn't have the money to pay its share.

The U.S. Department of Transportation didn't have the money to pay its 75% share because it didn't want the money to pay its 75% share. Never has enough money been made available for the federal government to pay its share. And, since 1982, no money has been made available for the federal government to pay its share because the Administration has not requested any.

The Department described its compliance with the Highway Beautification Act as a "low priority." Indeed, in a June 1983 memorandum by the Federal Highway Administration to the Secretary, it was proposed that the requirement that nonconforming billboards be removed be eliminated. In other words, the Federal Highway Administration proposed that there be no control of billboards along federal highways!

As a result of the 1978 amendment making it impossible for billboard owners to be compensated in any way other than by the payment of cash, the states' efforts to control the proliferation of billboards were put on hold. The states' hands were tied.

What I have proposed is that we un-tie the states' hands.... free them to address the billboard problems in their communities.

I have proposed the removal of the provision in the Highway Beautification Act which calls for "just compensation." We don't need it in the Act! "Just compensation" is required by the U.S. Constitution wherever there is a "taking."

Let's assume for a minute that there is a "taking" when a billboard is removed. The U.S. Constitution would require that the owner of that billboard receive "just compensation." The Highway Beautification Act wouldn't have to require it.

Just compensation for the removal of a billboard can take at least two forms: (1) cash compensation; or (2) amortization. That's what the highest courts in the land have told us.

By removing the "just compensation" language in the Highway Beautifiation Act, we are freeing the states to compensate billboard owners either by a cash payment or by amortization.

According to a 1985 GAO report, at least 27 states favor the removal of the "just compensation" language. They want to be free to work to put an end to highway pollution within their own boundaries. I want them to have that freedom!

It has been 25 years since the enactment of the Highway Beautification Act. When President Johnson signed the bill into law, he had in mind that it would improve the quality of life, help clean up our environment and improve the safety of our roads.

Now look at us. We haven't progressed toward those goals. We have turned back the clock. In terms of the number, size, lighting and spacing of billboards along our federal highways, we have regressed --- terribly!

The irony and most unfortunate thing about this is that while the federal government is "turning its nose up" at the Highway Beautification Act, states, cities and counties throughout this country are passing ordinances and laws designed to put an end to the visual pollution along their highways and byways. That's exactly what we asked them to do in 1965 when we asked them to develop plans for the control of outdoor advertising and told the states that we would help them make sure that their plans were adhered to.

Now, not only are we unwilling to help the states, we are doing a lot to hurt them in their efforts to clean up the highways and byways.

I know that the speakers here today are going to provide us with some very valuable information --- information about what the states would do to combat the billboard problem if they could, information about some of the fallacious arguments that are being bantered about relative to the billboard bill (for example the First Amendment "argument"), etc. I am very much looking forward to their testimony.

Again, I want to thank the Chairman for giving us this opportunity to hear from them. Thank you.

38-253 O—91——22

Mr. MINETA. Thank you very much, Mr. Lewis.

Councilmember Pavley.

Ms. PAVLEY. Thank you, Mr. Chairman. Good afternoon.

I have served as Mayor and Councilmember of the city of Agoura Hills for the past eight years. I am here today representing the National League of Cities, as well as the League of California Cities. Agoura Hills became L.A. County's 83rd city back in 1982. Agoura Hills is located about 35 miles west of downtown Los Angeles. We are bisected by the 101 freeway. We are nestled in the Santa Monica Mountains area.

The beautification of the freeway corridor has been our top priority since we incorporated. We have been very successful in adopting ordinances to encourage quality development, while also preserving the natural beauty of our area. We have passed sign ordinances, protective hillside ordinances, and adopted a community-supported general plan.

We have, however, been unable to eliminate the 30 billboards that dot four miles of our Ventura Freeway, the 101 corridor. Federal and State law has made it impossible to remove these structures.

I am continually asked by local residents, "Why can't you do something about the billboards?" This is the number one question that people ask me. They don't understand why the State and Federal Governments can regulate this undesirable land use within our city limits.

Our City Council has been actively seeking legislative solutions to address this problem. Our local State legislators have authored several bills on our behalf. The crux of our problem is the requirement that we have to use taxpayer dollars to buy out prohibitively expensive billboards. There are no State or Federal formulas to determine the value of a billboard. The lease and potential rental income, in addition to the value of the structure, determine the worth of the billboard. According to billboard companies, the value of each billboard could be as high as $100,000. It is interesting to note that even though the property owner is obtaining income from the improvement to his property, no additional property tax is paid by either the landowner or the billboard company.

Congress should amend the Federal Highway Act because cash payments to the billboard industry are wasteful, unwise, and Constitutionally unnecessary.

First, nonconforming signs are a local problem, to be solved through local law under land use powers defined by the State constitutions. State courts in the country have held that amortization is a Constitutional method for removing billboards. The decision on whether to make cash payments or to use the amortization technique should be left to local government.

What's more, billboards are a form of movable property which can be dismantled and relocated. Indeed, the billboard industry does this all the time. When a billboard is removed pursuant to a zoning ordinance, the billboard is not literally taken and used by the Government. On the contrary, the billboard is simply dismantled, after which it can be put on a truck and moved to another location. The landowner, of course, retains full title to the property, which can be used for any other lawful purpose.

Requiring local governments to pay cash for billboard removal gives special treatment to billboard companies not received by any other industry or nonconforming land use. All other land uses are regulated by local government without Federal interference and without cash payments.

The courts have approved the use of zoning to relocate billboards and other land uses, such as junk yards or cement factories. However, today only billboards are being singled out for special protection by Congress.

The courts say that the Government interest in regulating billboards is especially strong because billboards don't derive their value from the private land they stand on, but from the public roads that they stand next to. Without the captive audience delivered by a public highway, billboards have no inherent value.

Last year we asked our State legislators to amend the State's Business and Professions Code to allow local government the option of using amortization. It is legal for cities to amortize all other nonconforming uses over a period of time in order that landowners have ample opportunity to recoup their investments. The California courts have found reasonable amortization to be a Constitutional exercise of police power which does not require compensation.

Our billboards in Agoura Hills have already been in existence for at least 10 to 20 years, well before an amortization period would even begin. Our State legislators told us that they could not amend the State law to allow for the amortization of nonconforming billboards adjacent to Interstate Highways. To do so, they said, would mean our State could risk losing 10 percent of its Federal highway money. This is the requirement imposed by the Federal Highway Beautification Act.

Our city would like to remove billboards to meet the intent of the Highway Beautification Act. We would like the opportunity to enhance the beauty of our freeway for traveling motorists, attract quality development, and also improve our property values. In order to accomplish this goal, the Federal Highway Act should be amended to allow local governments the option of using amortization to reduce the number of billboards.

Agoura Hills has now become the gateway to the Santa Monica Mountains National Recreation Area. Their office headquarters are located within our city limits. We should no longer have to be called "billboard alley."

Forcing cities to use taxpayer dollars to remove billboards is unrealistic. Our city's relatively small budget makes this impossible. Our limited reserves are being spent on improving the freeways, overpasses, and local arterials.

I have heard that the 1990s is the decade of the environment. Please amend the Federal Highway Act in order to allow local governments to use amortization to reduce the visual blight on Federal highways without jeopardizing our State's Federal highway money.

Thank you very much for your attention.

Mr. MINETA. Thank you very much.

Now I would like to call on Mr. McMahon, Executive Director of Scenic America.

Mr. McMahon. Thank you, Mr. Chairman. Good afternoon, members of the committee. Mr. Lewis, thank you for coming this afternoon.

I am Ed McMahon. I am the Director of Scenic America. It is a national conservation organization dedicated to preserving America's scenic and unique landscapes, roadways, cities, and towns. I respectfully request that the complete text of my statement and the attached special report on the Highway Beautification Act be included in the official hearing record today.

Mr. Mineta. Without objection, so ordered.

Mr. McMahon. I am here today to testify on the need to reform the 1965 Highway Beautification Act. This law was passed to promote the safety and recreational value of public travel and to preserve natural beauty. Today, it does neither of those things.

Members of this committee may recall that the House of Representatives voted in favor of reform of this act in 1986, and then again in 1987, during the last highway reauthorization debate. Though supported by a majority of Congress, strengthening amendments to the Highway Beautification Act, including a cap on new billboards, were removed during the final conference on the 1987 highway bill.

Today we strongly urge the committee to include reform of the Highway Beautification Act in the 1990 highway reauthorization. We also urge the committee to hold hearings on H.R. 3389, the Billboard Control Act of 1989, introduced by Representative John Lewis and now pending before this committee. Without reform of the Highway Beautification Act, America's scenic resources will continue to deteriorate. Today, the Highway Beautification Act allows new billboards to be put up virtually everywhere, including in totally rural countryside, inside National Historic Districts, next to our National Parks, even adjacent to schools and churches.

In 1984 the Inspector General of the United States Department of Transportation reported that in a five-year period between 1979 and 1984 taxpayers paid to remove 1,957 nonconforming billboards along Federal highways in Florida. During the same period, 8,218 new billboards were erected along the same roads, resulting in a net gain of 6,251 billboards. Imagine if we had a Water Pollution Control Act that worked the same way.

Why are new billboards going up along our supposedly protected rural highways? Well, simply because the Highway Beautification Act is riddled with loopholes and exceptions. These exceptions have swallowed the rule. You will hear more about these exceptions from some of our following witnesses, but briefly, you may erect new billboards on any land zoned commercial; on any land zoned industrial; on any land which is called an unzoned commercial area; on any land called an unzoned industrial area; on Indian land and lots of other places you can put up a billboard. It doesn't make any difference if it's in totally rural countryside, miles from the nearest town or exit—or building, for that matter. You can put up a billboard today virtually anywhere.

Advertising Age reported in November of 1988 that eight of the top ten billboard advertisers in the United States promote cigarettes or liquor. What's more, they are numerous. The point of that is that most billboards have nothing to do with motorist informa-

tion. These include things like logo signs, low frequency radio, rest stop advertising, and many other nonpolluting alternatives to billboards. Indeed, the new National Transportation Policy makes it Federal policy to "promote standardized signs and increased information for travelers, particularly along scenic highways and pastoral routes."

A couple of thoughts on a few of the other loopholes.

First, size and height limitations on billboards—there is currently no height limitation on billboards along Federal highways. Billboards can be as tall as technology allows.

Size limitations—well, the average billboard in 1965 when this act was passed was 300 square feet, so the Federal Highway Administration set the limit at 1,200 square feet, four times bigger than the existing billboards at that time. You can build billboards as big as 3,000 square feet, bigger than most people's houses in many urban areas.

What about spacing? The law allows 20 billboards per mile along Interstates, 34 billboards per mile along primary highways, and up to 104 billboards per mile on primary roads inside cities.

To add insult to injury, the billboard industry has erected thousands of new billboards in minority and low income neighborhoods, the largest number advertising cigarettes and alcoholic beverages. Once again, there are no setbacks from things like schools or churches or National Parks. You can even put a billboard inside of a National Historic District.

While the law is overly permissive with respect to the construction of new billboards, it is overly restrictive with respect to the removal of nonconforming billboards. Today, as you have already heard, the law requires taxpayers to pay cash for the removal of all nonconforming billboards. Ironically, however, no money has been appropriated for billboard removal since 1982. As a result cities are told, "You can't take down a billboard unless you pay for it," but conveniently, there's no money available to do that.

The law also takes away the power of local governments to use their own local land use powers. The 1978 amendment to the Federal act says that communities which want to use their own land, use authority to remove billboards over time, a practice called amortization, run the risk of losing 10 percent of their highway construction funds.

There is not another industry in America that receives this special protection.

In 1985, the U.S. General Accounting Office declared that "accomplishing the goals of the Highway Beautification Act will require either additional Federal funding or a change in the compensation requirement of the act." We agree with the General Accounting Office. Either give us the money or repeal the requirement.

Perhaps the most environmentally destructive aspect of the so-called Beautification Program is its use as justification for the chain-sawing and herbiciding of trees on public land in front of billboards. When the Interstates were built, the Federal Highway Administration provided the money to plant millions of trees along our roadsides. The billboard industry doesn't like trees blocking the view of billboards, so in 1977 it persuaded the Federal Highway Ad-

ministration to legalize tree destruction by reclassifying it as "vegetation control." State officials now annually issue thousands of tree cutting permits to sign companies. Ironically, many of the trees being destroyed were originally planted under the Federal Landscaping Program.

Billboards are users of the Federal Highway System, but unlike motorists, truckers, and other road users, the billboard industry currently pays no road user taxes, tolls, or fees to use our roads. Likewise, there is no Federal property tax or excise tax on outdoor advertising. The average billboard along an Interstate Highway today will earn in excess of $30,000 a year. Despite that enormous revenue, there is currently no Federal permit fee to operate a billboard along a Federal highway.

We think it is time to end the national disgrace called the Highway Beautification Act and to reform it so that it indeed preserves natural beauty, protects trees, parks, historic districts, scenic roads, and allows a mechanism for removing nonconforming billboards that communities want to remove. We urge the subcommittee to support changes in the act which will: One, halt the construction of additional billboards; two, limit and reduce the size and height of existing billboards; three, increase the spacing between existing billboards; four, prohibit the destruction of trees on public land in front of billboards; five, remove existing billboards along designated scenic roads and near historic sites and districts, National, State, and local parks, wetlands, and other areas of critical environmental concern; six, either restore local governments' ability to remove nonconforming billboards, or appropriate the money to meet the cash payment requirement; seven, impose a Federal permit fee on billboards and use the money for effective enforcement of the act; and eight, promote alternative forms of motorist information, including logo signs, etc.

I appreciate your consideration. I would be happy to answer any comments that the committee might have. Thank you very much.

Mr. MINETA. Thank you very, very much, Mr. McMahon.

Now we will call on Dr. Floyd from the University of Georgia.

Mr. FLOYD. Thank you, Mr. Chairman. I am pleased to be here today, testifying on behalf of the 25,000 members of the American Planning Association.

I must tell you that the Highway Beautification Act is an almost total failure. In fact, it is difficult to imagine how the program could be made more ineffective in achieving its original stated objectives, be more perverted to benefit the supposedly regulated outdoor advertising industry, or be modified to more greatly hinder the efforts of State and local governments to cleanup billboard blight in their communities.

You don't have to depend just on my opinion. For one thing, we have the Inspector General of the Department of Transportation, who conducted a study in which they concluded that the outdoor advertising control program has been ineffective in improving highway beautification, as the number of signs located adjacent to the Nation's highways continues to increase.

The General Accounting Office also did a study, reaching similar conclusions. But the definitive word on the effectiveness of the pro-

gram comes from the outdoor advertising industry. They love it! If the program was any good, they wouldn't like it, much less love it.

In a recent press release, the Outdoor Advertising Association of America praised the Highway Beautification Act as "The Highway Beautification Act: A Law That Works." They rapturously extolled its virtues, saying that "taxpayers can only dream that every law that Congress passes works as well as the 1965 Highway Beautification Act."

I think any of us knows that when a regulated industry tells us how wonderful the regulation is, there is a very high probability that it isn't all that great.

Now, the question is, why does the outdoor advertising industry love the Highway Beautification Act? Well, for the first thing, the Highway Beautification Act was supposed to prohibit the erection of new signs in rural areas and in areas that were not areas of actual commercial or industrial use. Unfortunately, that has not been the case. There were tremendous loopholes, as others have told us here already, and the Federal Highway Administration has not enforced the law. For example, I personally ran into one when I saw billboards going up in a flood plain in an area that had no possibility of any industrial development, so I went to the local planning office. I said, "I'd like to see the zoning change request for this land." So they let me have it, and it said on there, "The purpose of this change is to get the land zoned industrial so that we can put up billboards." An absolute violation and circumvention of the act. The Federal Highway Administration refused to do anything, and the billboards are still there.

Another failure of the act is that at the same time we have had many billboards going up, we haven't been getting the old ones down. I would like to address one thing. We oftentimes hear about how many hundreds of thousands of billboards have come down as a result of that act. That is simply not correct. In 1966, the Federal Highway Administration conducted an inventory in all the States of all the signs that were out there on the so-called "protected highways." There has not been another inventory made since that date, so we don't even know how many are out there today. And you don't have to believe me for that; you can simply go to your own Congressional Research Service, who reached a similar conclusion.

However, certainly there were a lot of signs in the earlier days of the program, the little junk signs, that did come down. No question about that. Since 1980, however, according to the figures of the Congressional Research Service, we have something like 100,000 new conforming signs that have been erected during this time period. So there are simply more new signs going up all the time.

Of course, traditionally, communities have been able to get rid of nonconforming signs through amortization. This is characterized by the billboard industry as a "taking." It is not a taking. If it was a taking, we wouldn't have to be here discussing it because any time a community passed such a law, the billboard company would simply go to court and the court would say, "This is a taking and is thereby unconstitutional." But that is not what the courts are saying, except in a very few jurisdictions. Let me give you one example, and that is Raleigh, North Carolina.

Raleigh passed a new billboard ordinance several years ago, prohibiting the erection of any new billboards. They also said that existing billboards had to come down, except those on the Interstate and primary systems that were protected by this Highway Beautification Act. The other signs did have to come down.

It's kind of an irony that the Highway Beautification Act is the act which protects the existing billboards, but, of course, that's the way the billboard industry designed it.

The billboard industry then took the city to court. The Federal District Court gave summary judgment to the city, saying that this was not a taking. For one thing, the city wasn't taking the property. They were simply saying, "Move it." The billboard company retained title to this property, and they could move it, as they move signs all the time. This decision was also upheld in the Circuit Court, and the Supreme Court refused to take the case on the issue of amortization.

But right now we have communities, such as you've heard in the example here today, that are kept from cleaning up visual pollution in their communities by this supposedly anti-pollution legislation.

I would like to compare this with the Clean Air Act. Suppose that Congress wanted to amend the Clean Air Act to make it as ineffectual in achieving its stated objectives as the Highway Beautification Act is in achieving its stated objectives. First, it would be necessary to conduct an inventory of the existing air pollution sources, and then set a standard for new plants that is twice as bad as that, and new plants would be permitted anywhere the land was zoned commercial or industrial, or where there was any type of existing commercial or industrial polluting source, even when a country store burned its trash out back. Existing polluters would not be required to reduce their emission levels until they were paid to do so, and mandatory compensation levels would be set far in excess of original investments. Of course, Congress would not appropriate any money for the cleanup process, but at the same time Congress would prohibit States and local governments from using their Constitutional police powers to force polluters to reduce their emissions.

I am sure you will agree that to even suggest that the Clean Air Act be amended in this way would be totally ludicrous. Unfortunately, however, this absurdity is a valid analogy to the current Highway Beautification Act.

The American Planning Association, first, supports Congressman Lewis' bill to reform this program, and specifically recommends that the provisions of existing law should be enforced, including this absurd policy of permitting trees on the right-of-way to be destroyed to permit a greater view of billboards.

Second, new billboards should be permitted only where genuine and extensive commercial or industrial land use currently exists—which, I might add, is something the Federal Highway Administration could do on their own right now, if they would.

Third, Federal legislation should be enacted that restores to local governments the authority to remove billboards through amortization under local law through land use powers as defined by State constitutions.

Fourth, Federal, State, and local legislation should be amended to require the removal of billboards in inappropriate locations, especially in rural, scenic, historic, and residential areas.

And finally, the APA supports the logo-type signs to provide motorist information in a way that is not so visually offensive.

Thank you, Mr. Chairman. I would also be glad to entertain any questions.

Mr. MINETA. Thank you very much, Dr. Floyd.

I would now like to call on Paul Barkley, A.I.A.

Mr. BARKLEY. Thank you, Mr. Chairman. My name is Paul Barkley of Barkley & Pierce Associates, Falls Church, Virginia, an architectural firm. I am a former member of the Board of Directors of the American Institute of Architects and a Past President of the Virginia Society of Architects. We appreciate the opportunity to offer our views in support of Representative John Lewis' bill, H.R. 3389, to reform the Highway Beautification Act.

The Highway Beautification Act is a failure. It has been captured by the very industry whose excess it was designed to curb. It desperately needs reform, and H.R. 3389 will accomplish it. We hope that the subcommittee will incorporate this bill into the legislation you will craft to reauthorize the post-Interstate surface transportation program.

The A.I.A. supported the original Highway Beautification Act. We are deeply involved in our communities in shaping sign design. Architects care about the control of signage because billboard clutter damages the environment, undermines sound urban planning, detracts from good architecture, and hurts business. Any community bent on improving its image as a good place to live, work, and do business begins by cleaning up its signage. Signage well integrated into our urban settings and compatible with the landscape can be a public asset. Uncontrolled signage is a blight and, ironically, not very useful to the advertisers who want their messages noticed.

I speak not only as an architect, but also as Past President of the Falls Church Chamber of Commerce and as a former Chairman of the Falls Church Development Commission, where we have addressed many of these same issues.

The Highway Beautification Act is today a public policy outrage, and the loudest voice in favor of it belongs to the billboard industry. The act encourages construction along Federal highways. It shoves aside localities' traditional authority to regulate signage through zoning powers. It frustrates good community planning and design. It allows the sacrifice of publicly-paid-for trees and shrubs to billboard visibility. It blocks removal of signs that are supposed to come down.

The current law requires that cash be paid to an owner to compensate for the removal of a nonconforming sign. The cash compensation requirement is deceptive because it appears so reasonable. In fact, it is a cynical, unjustifiable barrier to sign removal. It relies on the inability of governments at all levels to divert scarce budget dollars to sign removal.

The traditional means of getting rid of nonconforming signs is amortization. Amortization as a method of compensation has been tested repeatedly in State courts and in Federal courts, and repeatedly affirmed. According to the Federal Highway Administration,

385 nonconforming signs were removed in fiscal year 1989. At this rate it would take over 200 years to remove just today's nonconforming signs. They will sooner fall down from old age.

The A.I.A. believes that owners should be compensated for removal of nonconforming signs. Amortization works, but cash compensation does not. H.R. 3389 repeals the cost compensation requirement. It would allow existing nonconforming signs to remain standing for five years. Owners would be compensated, but through the use of their billboards, not through the public treasury.

The number of signs along Federal highways has grown alarmingly, particularly through the unzoned commercial and industrial areas loophole, mentioned earlier. In 1985, a GAO report documented how those unzoned areas are established, with billboard companies planting gas pumps in corn fields and writing "district headquarters" on the side of the sheds.

H.R. 3389 would bring a halt to this nonsense by placing a moratorium on all new off-premise billboard construction along Federal highways. The idea of a moratorium will no doubt produce an outcry from the billboard industry, posing as the champion of small business. The claim is that billboards are essential economic tools, pointing motorists toward necessary businesses and services. This would be a powerful argument if it were true. It's not. The fact is that more than 85 percent of the billboards promote a product, and almost half push alcohol and tobacco.

A moratorium is not a radical proposal. The Republican Senate approved one when it passed tough highway sign controls in 1986. Ugliness does not aid a local economy or help business. That's why many places dependent on tourism have banned billboards entirely, or imposed moratoria.

Since 1985, more than 500 cities and counties have toughened their sign controls. In places where billboards have sprouted like weeds, such as Houston and Philadelphia, the business community is in the forefront of the sign control fight.

In my own community of Falls Chruch we brought down the last billboard years ago. We are now an attractive community and our economy is strong.

I thank you for your attention, and I will be glad to answer any questions.

Mr. MINETA. Thank you very much, Mr. Barkley.

Now let me call on Phoebe Driscoll of the Garden Club of America.

Mrs. DRISCOLL. Good evening, Mr. Chairman. Good evening. Mr. Chairman and members of the subcommittee, I certainly appreciate your staying so late to hear us.

I am Phoebe Driscoll, and as Chairman of the National Affairs and Legislation Committee, I am testifying for the Garden Club of America in support of H.R. 3389, Mr. Lewis' bill.

Established in 1913, the Garden Club of America is a national organization with member clubs from coast to coast and in Hawaii. United by our love and concern for plants, our members come to Washington and to our seats of local governments to be advocates for the welfare of our plants, which is directly tied to the welfare of our people.

Plants, like people, need clean air, clean water, and suitable habitats, and people, like you and me, have the right to see our plants, the flowers, grasses, shrubs, and trees of our rural and urban landscapes. The imposition of billboards along our highways denies our right of view.

Since 1914, when the Garden Club of America established a committee on beautifying settlements and highways, we have advocated billboard control. Today we strongly support H.R. 3389, the Billboard Control Act of 1989, legislation that would halt construction of new billboards along Federal highways, and would return control over billboard removal to States and local government, where it belongs.

The Highway Beautification Act of 1965 was supposed to protect our roadsides from billboard blight. Today, the law does little more than protect billboard companies from local regulation. In 1985 the U.S. General Accounting Office reported that new billboards were being erected three times faster than nonconforming billboards were being removed. Today, the removal of nonconforming billboards has essentially stopped. In fact, the Federal Highway Administration reports that only 385 nonconforming billboards were removed in fiscal year 1989. At this rate it will take 260 years—I hope our facts agree—to remove the remaining 99,990 nonconforming billboards. Our members simply can't wait that long.

At the same time, that removal of nonconforming billboards has come to a halt. The industry continues to erect thousands of new so-called "conforming billboards" in areas where they are completely out of place. Today, billboards are being erected in National Register Historic Districts, in wetlands like those outside of Assateague National Seashore, on the edge of National Parks and monuments like the Gettysburg National Park, the Lowell National Historic Site, and the Smokey Mountains National Park, and even along designated Scenic Highways.

I must say, I have noted that they are notably absent from the beautiful Washington cherry trees.

Last fall, when my husband and I drove the magnificent Skyline Drive in Virginia, we paid a fee to enjoy the billboard-free scenery. However, we have to endure a barrage of billboards before entering, truly "litter on sticks." The fact that people pay to see scenery free of billboards suggests to me that people want scenery free of billboards.

Adding insult to injury to a gardener, as new billboards are going up, millions of trees on public lands are being destroyed by billboard companies as they seek to make their billboards more visible. Many of the trees being destroyed were planted with taxpayer money, yours and mine. And as you know, trees—with their ability to absorb carbon dioxide—are truly one of the keys to our survival.

For example, the GAO's 1985 report stated that while Louisiana had planted 2 million pine trees between 1973 and 1978, the State now allows billboard companies to cut these trees down in order to enhance sign visibility.

The Garden Club of America urges Congress to reform the Highway Beautification Act, and particularly we urge the Surface Transportation Subcommittee to halt the construction of new bill-

boards and to allow State and local governments to remove existing billboards in and around historic sites and districts, local, State, and National Parks, and along designated Scenic Roads. At a minimum, no billboard should be allowed within one mile of our National Parks and historic landmarks.

In addition, the Garden Club of America urges the Surface Transportation Subcommittee to halt the practice of allowing billboard companies to destroy trees and other vegetation on public right-of-way near billboards.

Finally, the Garden Club of America urges the Surface Transportation Subcommittee to restore local authority over billboards and to establish a category of Scenic Highways where no billboards would be permitted.

Truly, if you have sensed some anger in my voice, it's not the lateness of the evening. It's what I've had to say, because I am truly angry at the visual pollution of billboards that blemishes my view of our urban and rural landscapes.

In a slightly lighter tone, perhaps Ogden Nash said it all: "I think I shall never see, A billboard as lovely as a tree. And indeed, if the billboards do not fall, I shall not see a tree at all."

Thank you for the opportunity to present the views of the Garden Club of America.

Mr. MINETA. Thank you very much, Mrs. Driscoll.

Now I would like to call on Elizabeth S. Merritt, Chief Litigation Counsel for the National Trust for Historic Preservation.

Ms. MERRITT. Thank you, Mr. Chairman and members of the committee. I know it is late and I know I'm the last witness and we would all like to go home, but I would like to take just five more minutes, because the reason I'm here is to talk about something that you haven't heard much about today, and that's the Department of Transportation's Congressional mandate to protect and enhance historic places and the environment.

A significant part of the National Trust's advocacy and litigation efforts involves transportation projects that threaten historic neighborhoods, landmarks, bridges, and archaeological sites. I am the person who goes to court to try to save these sites from harm and destruction by highway projects. If there is one thing that the National Trust and the Federal Highway Administration agree on, it is the ultimate goal that the Trust will stop filing lawsuits against them.

The National Trust was chartered by Congress more than 40 years ago to lead the private sector historic preservation movement. Today we have nearly 235,000 members around the country, and with the support of these members, the Trust works to advocate historic preservation as a fundamental value in Federal policy and community planning.

The national preservation program and Federal transportation policy have been closely intertwined from their inception. In fact, the National Preservation Act and the Department of Transportation Act were both signed into law on the same day in 1966. At that time, historic and scenic areas were severely threatened by the aggressive and destructive highway projects of the 1960s. In order to respond to this threat, Congress endowed the Department with a special responsibility for protecting and enhancing the re-

sources that would otherwise be most vulnerable to harm from the Nation's transportation program. Section 4(f) of the act prohibits Federal transportation projects from harming historic places unless there is no feasible and prudent alternative to doing so, and even then the projects must include all possible planning to minimize harm.

Almost 25 years later, section 4(f) remains one of the most important and most effective historic preservation policies on the books. This law really works to save the Nation's heritage for future generations.

The National Trust has undertaken a major institutional effort to ensure that transportation projects do not destroy our historic neighborhoods and landmarks. Ten times in the last ten years the National Trust has gone to Federal court to enforce the Department's compliance with section 4(f). Many of these controversies have resulted in strong legal precedents that mandate adherence to both the letter and the spirit of the law.

The function of section 4(f) is to hold everyone's feet to the fire, to force the project planners to look just a little bit harder for good alternatives that will minimize harm to historic resources. For every project that we fight in court, such as the Presidential Parkway in Atlanta, there are countless others where the 4(f) process itself leads to the successful modification of highway projects in a way that resolves transportation problems without harming historic resources. In our view, this is exactly the way section 4(f) is supposed to work.

Currently, the National Trust is urging the Federal Highway Administration to deny funding for a proposed highway that would bulldoze through five historic districts in South Pasadena, California, at a cost of more than half a billion dollars for six miles. This massive highway would destroy nearly 1,500 homes and 7,000 trees, and this is in a metropolitan area that doesn't exactly have a surplus in either category.

Right now, section 4(f) is just about the only thing standing between neighborhoods like South Pasadena and the bulldozer. We don't want South Pasadena to suffer the same fate as the historic neighborhoods of Atlanta, where 750 homes were bulldozed before a court finally stopped a devastating highway project in the early 1970s. Today, those empty acres remain as a haunting reminder of the communities that were sacrificed. Little stairs and walkways still lead up to vacant lots where homes once stood. But in Atlanta, the surrounding historic neighborhoods joined forces and vowed not to let the damage go any further. With the help of section 4(f) and the National Trust, and now the city of Atlanta, these committed local citizens have been able to save their neighborhoods from the ravages of the Presidential Parkway.

After almost two decades, the city is on the verge of having the opportunity to reclaim this land for people, not pavement.

One of our primary reasons for being here this afternoon is to emphasize that section 4(f) is extremely effective, and the National Trust wants to keep it that way. In light of this mandate, the Trust is especially disappointed that the new statement of National Transportation Policy, released this past week, has apparently

overlooked section 4(f) altogether. Incredibly, we find not a single reference to section 4(f) in this entire 129-page report.

The National Trust advocates the continued use of section 4(f) as a fundamental component of Federal transportation policy. We believe that strong support for section 4(f) is a litmus test of the Nation's commitment to the conservation of our natural and historic resources.

Today I would like to point out just three of the measures we suggest to make this policy even more effective.

The first is a stronger emphasis on integrated planning. The lure of low-match Federal highway funding remains a powerful temptation to State and local governments to trade off their heritage for the promise of highway mobility, and that promise is too often illusory, as new highways only induce new development, more traffic, and ultimately, gridlock.

To restore the connection between transportation decisions and comprehensive planning, we recommend that new legislation should require the development of State and local plans that integrate transportation roles with broader regional and land use planning. These planning efforts must begin to realistically address the vicious cycle of growth management problems that is generated by these new highways.

The second measure we propose is the availability of more flexible funding options. New legislation should provide adequate flexibility to ensure that the States do not become locked in to more destructive options simply because they are afraid of losing Federal funding altogether. The new transportation policy does endorse greater funding flexibility, but it suggests this flexibility will only be used to find the most cost-effective solution. We believe this approach is too restrictive. Funding flexibility should also be used to promote projects that will be less harmful to historic places and the environment.

Third, we propose the adoption of mitigation incentives. Given the enormous potential for highways to harm historic places, new legislation should provide affirmative incentives to the States to place more emphasis on conserving and protecting these resources. This kind of incentive would promote the Department's mandate of protecting these special places.

In conclusion, Mr. Chairman and members of the committee, we believe that transportation projects can be planned in a manner that minimizes harm to historic places and actually enhances the environment. That's the essence of the recommendations that we have made today. We would love to see the day when a 4(f) lawsuit against the Department of Transportation is a rare exception. In the meantime, the National Trust is eager to work with the committee and the Administration to incorporate the preservation of America's heritage into a new transportation vision.

Thank you.

Mr. MINETA. Thank you very much, Ms. Merritt.

Let me ask the panel, many of you on the panel believe that the Highway Beautification Act has been a failure. According to the 1983 GAO report, over 2,230 nonconforming signs have been removed. In this regard, I am wondering how effective city and county regulations are for controlling the erection of billboards.

Mr. McMahon?

Mr. McMahon. Cities and counties can stop the construction of new billboards. Over 2,000 cities in this country have done that, including your own city of San Jose, California; Fulton County, Georgia, most recently; DeKalb County, Georgia, where Mr. Lewis is from; and many, many other places.

The problem, however, is that while you can stop the construction of new billboards, you simply can't remove the existing ones because the existing law prevents you from doing that.

Second, we think that there is a Federal interest. The law that was passed was the Federal Highway Beautification Act, and there are certain places where, as a matter of Federal law, we should not be allowing new billboards regardless of what local communities are doing, and those are places like next to our National Parks, in historic districts, along scenic roads, and rural countryside, and certainly no billboards should be allowed next to schools and churches and places like that.

So yes, local communities can stop the construction of new billboards. The law doesn't prevent them from doing that. It just prevents them from taking them down.

Mr. Mineta. Even in the case of taking them down, the law authorizes that, but it's just that monies haven't been appropriated for that purpose?

Mr. McMahon. That's right. Congress stopped appropriating money in 1982, so cities now essentially face a Catch-22. They are told, "You can't take them down unless you pay for them." It's a 75 percent Federal share, and the 75 percent of the Federal share is not there so they just can't do it.

Mr. Mineta. Now, the existing provisions of the Highway Beautification Act require the payment of "just compensation" for the removal of nonconforming signs along Interstate and primary highways. Could you explain to the committee why amortization should be considered "just compensation" upon removal of nonconforming billboards?

Mr. McMahon. I would make a couple of comments on that.

First, I would say that a better way to describe cash compensation is "unjust enrichment" or paying a polluter to stop polluting. Amortization is the traditional way in which local governments get rid of nonconforming land uses. I mean, there are lots of nonconforming land uses in this country, garbage dumps, junk yards, taxidermy shops, smelters—all of those are nonconforming land uses. In every case in the United States, those nonconforming uses are given a period of time—you change the zoning, and people typically will give you three years, five years, ten years in which to remove the nonconforming land use. That's what's called amortization. The owner of whatever the use is is given a whole period of time to remove it.

Billboards are the easiest thing to move because they are personal property, not real property. You can take it down, put it on a truck, move it around, just like any other form of industrial equipment. However, the billboard industry has a special deal, and their special deal is that you can't use local land use authority to amortize billboards. You can't use local government authority. You can for everything else, but not for billboards. The only reason is a po-

litical reason, and we simply think that's wrong. We think this is a local government issue. Land use is a local government issue. If I was up here advocating Federal land use controls, people would be throwing me out the door. But we have Federal land use controls for the benefit of the billboard industry.

What we are saying is, give control back to local government. If a city wants to be ugly, wants to be overrun with billboards, then I say so be it. But if a city wants to be beautiful, the Federal Government shouldn't prevent them from being beautiful, and that's the way the law is working today.

Mr. FLOYD. Mr. Chairman, I would point out that this is the only Federal anti-pollution program that tells the polluters they can keep on polluting until they are paid to stop polluting. But then, of course, Congress doesn't appropriate the money to pay them to stop polluting. To me, that doesn't make any sense.

Billboard pollution should be cleaned up like other pollution. As others have emphasized, we're not talking about taking property. We're talking about moving property. This is personal property.

Yes, there is some loss, obviously, in doing so. But there is also loss in any other pollution program where we tell someone whose factory is polluting the air, for example, "Clean it up." Why do we tell the billboard industry, "You don't have to clean up"? Not only that, we are making sure that no State or local government can make them clean up.

Mr. MINETA. Dr. Floyd, wait until we get through with the Clean Air Act and then we'll see about that. [Laughter.]

In areas where nonconforming billboards are being removed, what is the source of funding for payment of that?

Mr. MCMAHON. Well, there are not a lot of nonconforming billboards being removed today. There are a couple of things going on. One is that a number of communities have decided to do the same thing with billboards that we do with things like toxic waste dumps. We have a Superfund, and chemical companies pay into that and they use that money to clean up toxic waste dumps. So some communities have decided, well, if we're going to be forced to pay, then why don't we set up a sign abatement fund, like a Superfund for visual toxic wastes, put a tax on billboards, and we'll use that money to take down nonconforming billboards? That's one thing that's happening.

Another thing is that a number of communities have simply decided that it is ridiculous to allow new, conforming billboards to go up in one location, like an area that is zoned for heavy industry, and at the same time the billboard industry is refusing to remove billboards in a residential area. So they simply said, "All right, if you want a permit to put up a new billboard in a conforming area, then you have to take down one—two, three, whatever—nonconforming billboards somewhere else. In other words, they condition the grant of the permit upon the bringing into conformity of something else.

There are some States that basically have paid. Maine, for example, has no billboards, as do three other States today. They did pay to remove them. They used Federal money before the Federal Government stopped appropriating it. But there is very little billboard removal going on in this country anymore, except by amortization,

and that's only along State highways and local streets, not along Federal highways.

Mr. MINETA. In that regard then, Mr. McMahon, to what extent do local laws determine the location of billboards?

Mr. MCMAHON. It varies tremendously, from no control whatsoever to "You can't have any at all." Take the Silicon Valley. There's almost no community in the Silicon Valley that allows any billboards at all. Palo Alto, Menlo Park, you name it—San Jose is the same thing. San Jose said, "No more." Now, there are other places you can go, like Los Angeles—where you can put a billboard anyplace. I mean, literally, there are billboards in people's front yards in low income neighborhoods and rental housing. The billboard industry will go in and put a billboard in someone's front yard, simply because there is no control.

We think that there is a compelling national interest to keep billboards out of certain places, and we think the National Park System is one of them. You can go to Gettysburg today and there are billboards one foot from the Park boundary. You can stand and watch where Pickett's troops charged, past the billboards and the Tastee-Freeze parking lot, and they regrouped next to the Kentucky Fried Chicken billboard, and then they charged up the hill. That's what it looks like today. We think that that's simply wrong.

Mr. MINETA. Well, maybe we can get something from the peace dividends. [Laughter.]

Mr. MCMAHON. We hope so.

Mr. MINETA. Mr. Hastert?

Mr. HASTERT. I would like to thank the chairman for the opportunity to talk, but remind him that when you borrow money and operate your business on borrowed money, there are never any dividends. So there's peace, but that's another issue for another time.

You cite a lot of numbers and statistics about billboards being removed and erected since enactment of the Highway Beautification Act. I hear some conflicts. Some give a lot of statistics, and then someone else says there's never been a comprehensive study done. Please answer that question. Has there been a study done? Has there been an inventory done, nationally?

Mr. FLOYD. Sir, there was an inventory done in 1966. That's the last one.

Now, the Federal Highway Administration keeps some numbers on the number of nonconforming signs and illegal signs that are——

Mr. HASTERT. Well, let me ask Mr. McMahon, then.

Didn't you say that you had statistics on signs taken down?

Mr. MCMAHON. Here are the statistics. The Federal Highway Administration did do an inventory in 1966, They took an inventory of so-called "illegal" signs and so-called "nonconforming" signs. There has been no inventory done since 1966, but based on the numbers they came up with in 1966, they will tell you every year how many so-called "illegal" signs were removed, and how many nonconforming signs were removed. They keep no statistics on so-called "conforming" signs that take the place of the so-called "nonconforming" signs.

Mr. HASTERT. So you're telling us—and GAO did a study in 1983, and that's a while back, too—so you are saying there are no statistics?

Mr. MCMAHON. There are no valid numbers on this. Nobody has a clear idea of how many billboards there are.

Mr. HASTERT. Because if you had numbers and were citing numbers, I was going to ask you to submit them for the record. But if you don't have them, you can't do it.

Mr. MCMAHON. Right.

Mr. HASTERT. Okay.

I guess I am going off the reservation here in a sense, but I understand that most of the owners of billboards are small businesspeople, not large billboard companies.

Mr. MCMAHON. Well, there are some people in the room who might differ with that. Most of the billboards in this country, over 60 percent, are owned by about nine big companies. They are represented here today, among them Gannett Outdoor, which is a big multinational company, owns USA Today, among other things; 3M Company; Nagle Outdoor Advertising, among others. In fact, the billboard industry has been changing dramatically over the last 15 years. Where there used to be lots of small locally-owned companies, they have been gobbled up by big companies.

Mr. HASTERT. I think you misunderstand. I said "individually owned billboards."

Mr. MCMAHON. Very few of those. Most billboards are owned by companies.

Mr. HASTERT. I beg to differ with you, but I might be misunderstanding.

Let me just make my comment. You frame this argument in the frame of pollution, and that's fine. It's an emotive issue and you frame it in that issue when you talk about the Clean Air Act and you cite pollution, and I guess that's something. But, you know, in 1970 when I was in another life as an educator, I had the opportunity to travel to the Soviet Union and Eastern Europe. In that time there were no billboards, there were no signs. There was nothing at all that talked about products or places to sleep or places to eat, I guess particularly because there were no choices that people had economically. I am told—I haven't been there recently, but I am told that now in Eastern Europe, as there are economic choices, as there is economic development, as there is a free trade system of free economy that is starting up, all of a sudden you have "Eat at Joe's" and "Buy Levis" and "do this and do that," which I guess is somewhat endemic of a free economy.

I am saying that maybe what you are talking about is part of freedom of speech that we have in this country and freedom of choice that we have in this country, and that maybe it isn't all sight pollution, but that we do give people economic choices. I think of the area that I represent—I don't particularly like billboards and I don't think they're particularly attractive, but I think they do serve an economic function and give people the economic choices in this country. It's what institutions you support and what you believe in. If you, as the City Council or the Garden Club or anybody else, think in your minds that a beautiful America is this, that's one thing. But if there is an economic function and some

freedoms that are guaranteed in the Constitution—and property is one of those—when you say "This is a property," it is a property that you can move down the street. But when Joe's Bait Shop, for instance, may be next to a beautiful lake or something, there is, you move his sign two miles down the road, it's not very effective any more.

That's a comment. I don't expect any answer, and with that I will relinquish my time.

Mr. McMahon. I have an answer——

Mr. Hastert. I'm not asking for an answer, thank you.

Mr. Mineta. Mr. Lewis?

Mr. Lewis. Mr. Chairman, I would like to say that I hope, as the people of Eastern Europe move toward Democracy and exercise free speech and freedom of assembly, that they are not copying the worst of America. They should profit from our mistakes.

Maybe a member of the panel could provide us with some data or some information addressing some of the concerns that my colleague from Illinois raised?

Mr. McMahon. A couple of things. We would ask that the General Accounting Office report and the Inspector General's report both be submitted into the record. That's two things.

[The reports follow:]

BY THE COMPTROLLER GENERAL

Report To The Chairman, Committee On Environment And Public Works United States Senate

OF THE UNITED STATES

The Outdoor Advertising Control Program Needs To Be Reassessed

The Highway Beautification Act of 1965 required that states control outdoor advertising along federally funded interstate and primary highways. Since the enactment of the act, thousands of outdoor advertising signs have been removed to enhance the natural beauty of the nation's highways. However, many prohibited signs are still standing and are likely to remain so because federal funds are not being appropriated to compensate sign owners for their removal, as required by the act.

Accomplishing the goal of the Highway Beautification Act will require either additional federal funding or a change in the compensation requirement of the act, as amended. GAO recommends that the Congress reassess the outdoor advertising control program. In making this reassessment the Congress will need to weigh the program's goal and requirements against program costs.

UNITED STATES GENERAL ACCOUNTING OFFICE

GAO/RCED-85-34
JANUARY 3, 1985

COMPTROLLER GENERAL OF THE UNITED STATES
WASHINGTON D.C. 20548

B-216911

The Honorable Robert T. Stafford
Chairman, Committee on Environment and
Public Works
United States Senate

Dear Mr. Chairman:

In response to your request, this report provides information on the effectiveness of the outdoor advertising control program which was established by the Highway Beautification Act of 1965.

As arranged with your office, unless you publicly announce its contents earlier, we plan no further distribution of this report until 21 days from the date of the report. At that time, we will send copies to the Chairmen, House Committee on Public Works and Transportation, Senate Committee on Appropriations, and House Committee on Appropriations; the Secretary of Transportation; and other interested parties. We will also make copies available to others upon request.

Sincerely yours,

Charles A. Bowsher

Comptroller General
of the United States

COMPTROLLER GENERAL'S
REPORT TO THE
COMMITTEE ON ENVIRONMENT
AND PUBLIC WORKS
UNITED STATES SENATE

THE OUTDOOR ADVERTISING CONTROL PROGRAM NEEDS TO BE REASSESSED

D I G E S T

The Highway Beautification Act of 1965 established a national policy and program for the control of outdoor advertising along federally funded interstate and primary highways. The purpose of control is to protect the public investment in such highways, to promote the safety and recreational value of public travel, and to preserve natural beauty. Each state is required to develop and administer its own sign-control program consistent with the national policy and program. The Department of Transportation, through its Federal Highway Administration (FHWA), oversees the states' programs. The Secretary of Transportation is authorized to withhold 10 percent of the annual federal highway funds of any state that has not established and maintained an effective sign-control program.

The act and implementing regulations require states to remove "nonconforming" and "illegal" signs and restrict the construction of new signs. Nonconforming signs, as defined by the regulations, are those that were legally erected before the program's requirements became effective. Owners of these signs and their sites must be compensated for their removal. The federal government pays 75 percent of the cost of compensation and the states are responsible for 25 percent. Illegal signs are those that were erected after the act's requirements became effective. These signs must be removed expeditiously and removing them does not require the payment of compensation to sign and site owners.

A 1978 amendment broadened the Highway Beautification Act's compensation provision by requiring that monetary compensation be paid to sign and site owners for signs that are removed because they do not conform to local laws or ordinances. Prior to the amendment, localities could remove signs that did not conform to local laws or ordinances without providing monetary compensation.

While over $200 million has been spent on the program since 1965, annual federal program expenditures have declined from about $27 million in fiscal year 1976 to about $2 million in fiscal year 1984. As of September 30, 1984, about $15 million in program funds have been obligated and remain to be spent by the states. Current funding authority for the program expires at the end of fiscal year 1985.

The administration has not requested new program funds in its budgets since fiscal year 1982, explaining that the program was being reassessed. The Congress appropriated no new funds to the program for fiscal year 1984. States cannot be required to remove nonconforming signs if no federal funds are available for paying compensation but they must continue to remove illegal signs and restrict new signs.

In a July 1, 1983, letter, the Chairman, Senate Committee on Environment and Public Works, asked GAO to obtain information on the effectiveness of the outdoor advertising control program. On the basis of that letter and discussions with the Chairman's office, GAO focused its work on:

--How many illegal and nonconforming signs remain standing and what will it cost to remove them?

--How effective are state sign-control programs and how effective is federal oversight of such programs?

--How has the 1978 amendment to the act affected sign control?

As requested by the Chairman, GAO also addressed other specific questions regarding program status and sign-control policies, procedures, and practices. (See pp. 28 to 41.)

In carrying out its work, GAO reviewed seven states' outdoor advertising control programs and conducted a questionnaire survey of the 50 states.

STATUS OF SIGN REMOVAL

Although about 587,000 signs have been removed since the program began in 1965, about

172,000[1] nonconforming and illegal signs remained standing along our nation's interstate and primary highways as of September 30, 1983, according to FHWA data. Of the remaining signs, about 124,000 are nonconforming and about 48,000 are illegal. These were the most recent comprehensive data available at the time of the GAO review. GAO is concerned, however, about the reliability of some of these data. GAO found the data on remaining illegal signs to be unreliable for three of the seven states it reviewed. (See pp. 6 and 14.)

The removal of nonconforming signs has declined about 78 percent since 1979 as federal program expenditures have decreased. It is unlikely that the remaining nonconforming signs will be removed in the near future since FHWA estimates that about $427 million in federal funds would be required to remove the 124,000 such signs that remain standing. (See p. 7.)

The removal of illegal signs has also declined in recent years. Seventy-three percent fewer signs were removed in 1983 than in 1980. This decline is not, however, attributable to the reduction in federal funds, since removing illegal signs does not require the payment of compensation. Rather, limited state resources, state procedures which slow sign removals, and lack of program support have contributed to the slow removal of illegal signs, based on GAO's review of programs in seven states. (See p. 11.)

FEDERAL OVERSIGHT AND STATE PROGRAM PROBLEMS

Although federal law requires states to remove illegal signs and restrict new ones irrespective of federal funding, FHWA's overall oversight of state sign-control programs declined as federal funding decreased. FHWA deemphasized the program and, in one FHWA regional administrator's view, states may have taken advantage of this relaxed approach. A 1983 FHWA review of state programs identified or

---

[1]Not including signs affected by the 1978 amendment. (See p. iv.)

restated problems with state programs and suggested that some states were not effectively controlling outdoor advertising. For example, the review indicated that Arizona, Kentucky, and Louisiana were not removing illegal signs expeditiously. While the Secretary of Transportation has not penalized any state for a program infraction since 1977, FHWA has worked with some states to resolve problems with their programs. (See p. 17.)

In June 1983, FHWA presented to the Office of the Secretary of Transportation a proposal for revising the outdoor advertising control program which calls for

--limiting outdoor advertising control to rural interstate routes,

--eliminating the mandatory compensation requirement for the removal of nonconforming signs,

--removing nonconforming signs within 5 years with discretionary federal highway funds, and

--replacing the 10-percent funding penalty with a more flexible enforcement provision.

As of October 1984, the proposal was still being considered by the Office of the Secretary. (See p. 21.)

EFFECTS OF THE 1978 AMENDMENT

The 1978 amendment increased the cost of outdoor advertising control by increasing the number of signs that cannot be removed without compensation. FHWA estimates that 38,000 additional signs that did not conform to local laws or ordinances became eligible for monetary compensation because of this amendment and that their removal will require an additional $334 million in federal funds. The amendment has hindered sign removal in some localities that had planned to remove signs without paying monetary compensation. In lieu of monetary compensation, these localities would have allowed sign owners to retain their signs for a specified period of time in order to recoup their investment. (See p. 22.)

Views on the 1978 amendment and its effects vary. In response to the GAO questionnaire survey, 32 states indicated that the amendment had no effect on their states' sign-control program and 17 states indicated that the amendment made it more difficult to remove signs. One state did not respond to this question. Nine of the 17 affected states indicated that the amendment prevented them from removing signs without paying monetary compensation. Twenty-seven states greatly or somewhat favored repealing the amendment.

Several national organizations, such as the Garden Clubs of America, the Sierra Club, and the National League of Cities, also favored repealing the amendment. However, advertising and business organizations generally opposed repeal; one such organization stated that the 1978 compensation amendment closed a "loophole" in the act that allowed localities to remove signs without paying compensation.

The Department of Transportation also opposed the 1978 amendment. In a letter included in the congressional record, the Secretary of Transportation stated that the broadened compensation requirement represented a federal intrusion into local land-use control prerogatives and would undermine sign-control efforts.

RECOMMENDATION TO THE SECRETARY OF TRANSPORTATION

FHWA has completed a review of the outdoor advertising control program and has proposed program changes to the Office of the Secretary of Transportation, which would require legislation. GAO recommends, therefore, that the Secretary of Transportation complete the review of the FHWA proposal, develop the Department's position on the program, and present that position to the Congress. (See p. 43.)

RECOMMENDATION TO THE CONGRESS

GAO's review shows that without additional federal funding or a change in the compensation requirement of the Highway Beautification Act, as amended, the 1965 act's goal--to control outdoor advertising along federally funded interstate and primary highways--will not be accomplished. GAO recommends, therefore, that the Congress reassess the outdoor

advertising control program. In making this reassessment, the Congress will need to weigh the program's goal and requirements against program costs and, if warranted, consider changes to the goal and requirements which reflect an appropriate level of funding. (See p. 43.)

AGENCY COMMENTS

GAO did not request agency comments on this report. However, GAO did discuss the report's contents with officials from the Department of Transportation and the states it reviewed.

GLOSSARY

Amortization	To provide for the gradual extinguishment of an obligation over time. Amortization allows sign owners to retain their signs for a specified period of time in order to recoup their investment. After that period of time, the signs are removed without monetary compensation.
Arterial highway	A highway primarily for through-traffic, usually on a continuous route.
Federal-aid highway	A designated route upon which federal funds may be used.
Illegal sign	A sign erected or maintained contrary to state law. Such signs must be removed without compensation.
Information center	A building or portion of a building in a roadside area under the control of the highway agency, primarily to furnish travel, other information, and services to motorists.
Just compensation	That payment required by law for the loss sustained by the owner as a result of taking or damaging private property for highway purposes.
Logo	A distinctive emblem, symbol, or trademark that identifies a product or service.
Nonconforming sign	A sign that was lawfully erected but that no longer complies with state laws or regulations passed after it was constructed or that fails to comply with state laws or regulations due to changed sign conditions, such as the addition of lighting. Just compensation must be paid when a nonconforming sign is removed.
Off-premise sign	An outdoor sign, display, or device advertising a service or product at a location other than on the property where such service or product may be obtained.
On-premise sign	An outdoor sign, display, or device advertising an activity conducted on the property on which the sign is located or advertising the sale or lease of that property.
Primary highway	A rural arterial highway and its extension into urban areas.
Right-of-way	That portion of land, property, or interest therein, usually in a strip, acquired for or devoted to transportation purposes.

CHAPTER 1

INTRODUCTION

Federal control of outdoor advertising grew out of the construction of the Interstate Highway System. In 1958, about 2 years after states began building interstate highways, the Congress declared it in the public interest to control outdoor advertising near these highways. As an inducement, the Federal-Aid Highway Act of 1958 (Public Law 85-381) offered highway funding bonuses to states that agreed to control signs near new interstate highways. Through fiscal year 1984, about $42 million had been awarded to the 23 states in the "bonus program," which is still in effect.

The Highway Beautification Act of 1965 (Public Law 89-285) broadened outdoor advertising control by requiring that states control signs near both interstate and primary highways or risk a federal highway funding penalty. Among other things, the act stated:

> "The Congress hereby finds and declares that the erection and maintenance of outdoor advertising signs, displays, and devices in areas adjacent to the Interstate System and the primary system should be controlled in order to protect the public investment in such highways, to promote the safety and recreational value of public travel, and to preserve natural beauty."[1]

Each state has established and now administers its own sign-control program. It may, if it chooses, set sign control standards that are stricter than the national ones. The Department of Transportation, through the Federal Highway Administration (FHWA), oversees state programs and administers federal funds appropriated for sign control. The act empowers the Secretary of Transportation to withhold 10 percent of annual federal-aid highway funds from any state that does not have an effective sign-control program.

HOW SIGN CONTROL WORKS

The Highway Beautification Act, as amended (23 U.S.C. 131), does not require states to remove all existing signs or prohibit the erection of all new signs. The major classifications of signs that are exempted from control are

--signs on the property on which the advertised activity is conducted (on-premise signs--see photograph, p. 3);

---

[1]The act also provided for the control of junkyards and for landscaping and scenic enhancement along interstate and primary highways.

--directional and other official signs and notices required or authorized by law;

--signs in zoned and unzoned industrial and commercial areas that meet state requirements as to size, lighting, and spacing (see photograph, p. 3); and

--signs classified as landmarks.

States are required to remove nonexempted signs and prohibit the erection of new ones. Signs that were lawfully erected but do not comply with state laws passed after the act are classified as "nonconforming." They are to be removed and the sign owners and site owners are to receive just compensation. Any sign erected contrary to state law is classified as "illegal" and must be removed promptly without compensation to owners.

The Federal-Aid Highway Act of 1978 amended the Highway Beautification Act's compensation provision. The amendment requires that monetary compensation be paid in all cases when nonconforming signs are removed, whether or not they are removed because of the beautification act's requirements. For example, under this amendment, monetary compensation must be paid if signs are removed because of local zoning or land use controls. Prior to the 1978 amendment, these signs could be removed without paying monetary compensation. Some localities had required that signs be removed after a write-off or amortization period.

PROGRAM FUNDING

Under the act, the federal government pays 75 percent of the cost of compensating owners of nonconforming signs and their sites. The states are responsible for the remaining 25 percent. Since 1965, about $203 million in federal funds has been expended for outdoor advertising control, including bonus program payments under the 1958 highway act. As of September 30, 1984, about $15 million in program funds have been obligated and remain to be expended by the states. Annual program expenditures peaked at about $27 million in fiscal year 1976 and have been declining since then. Only about $2 million was expended in fiscal year 1984. (For additional information on program expenditures, see app. I.) The administration has not requested new program funds in its budgets since fiscal year 1982, and the Congress appropriated no new funds to the program for fiscal year 1984.

Current funding authority for the program expires at the end of fiscal year 1985. However, the requirements of the Highway Beautification Act, as amended, are a permanent part of the U.S. Code and states must continue to implement the program or face the loss of 10 percent of their federal-aid highway funds. States must continue to restrict new signs and remove illegal ones even if the funding authority expires. States are not required to remove nonconforming signs, however, if no federal funds are available for the federal share of compensation.

On-premise sign.

OBJECTIVES, SCOPE, AND METHODOLOGY

In a July 1, 1983, letter, the Chairman, Senate Committee on Environment and Public Works, asked us to obtain information on the effectiveness of outdoor advertising control under the Highway Beautification Act of 1965. On the basis of that letter and a subsequent discussion with the Chairman's office, we focused our work on the following three questions:

--How many illegal and nonconforming signs remain standing and what will it cost to remove them?

--How effective are state sign-control programs and how effective is federal oversight of state programs?

--How has the 1978 amendment to the act affected sign control in cities and other localities?

As requested by the Chairman, we also addressed other specific questions regarding program status and sign-control policies, procedures, and practices. See appendix II for a complete list of questions we addressed and page references for our responses.

In carrying out our work, we interviewed officials from the Department of Transportation, Office of the Secretary; FHWA headquarters, regions, and divisions; state transportation or highway agencies; cities and other local jurisdictions; and business, advertising, governmental, and environmental organizations. We reviewed program-related documents, including legislative records, federal-state agreements, federal and state regulations and procedures, progress reports, state sign-permit records, vegetation control and tree-cutting procedures and permits, FHWA's reviews of state programs, and correspondence.

Because each state establishes and administers its own program, we selected, with FHWA's and the Committee's assistance, seven states for review: Arizona, Georgia, Kentucky, Louisiana, Maine, Oregon, and South Dakota. We chose these states because they had different program performance records, are geographically dispersed, and are within six of FHWA's nine regions.

To examine the impact of the 1978 amendments, we also looked at sign control in Dallas, Texas; Portland, Oregon; and Southampton, New York--local jurisdictions whose sign-control programs were affected by the amendments.

To obtain states' views on the sign-control program and information on how they are implementing it, we conducted a questionnaire survey of all state transportation or highway agencies. We received responses from all 50 states. The results of this survey are included throughout this report. States' views on options for the future of the program are included in appendix III.

To obtain interested parties' views on the program and how it is being implemented, we interviewed officials from the American Association of State Highway and Transportation Officials, the American Automobile Association, Garden Clubs of America, National Coalition to Preserve Scenic Beauty, National Electric Sign Association, National League of Cities, Roadside Business Association, Sierra Club, Small Business On-Premise Sign Foundation, and Travel Information Centers, Inc. Officials from the Outdoor Advertising Association of America declined to be interviewed.

We did not evaluate the effectiveness of all state sign-control programs. We did, however, obtain information on the effectiveness of programs in the seven states mentioned.

We relied on data from FHWA's highway beautification program annual statistical progress reports for fiscal years 1979-1983 to determine the status of the outdoor advertising control activity because this was the only available comprehensive data. Although we did not examine in depth the reliability of these data, we are concerned about the reliability of some of these data and have noted these concerns where appropriate.

We previously reviewed the outdoor advertising control program. In March 1978, we reported[2] that

--progress had been achieved in controlling the erection of new signs and in removing illegal signs;

--progress in removing nonconforming signs had been slow; and

--if all illegal and nonconforming signs were removed, many signs would remain because of the exemptions granted under the act.

We concluded that the objectives of the act would not be accomplished in the near future and recommended that the Congress reassess the act.

The study on which we are now reporting was conducted from August 1983 to October 1984. At the Committee's request, we did not obtain agency comments on the report. We did, however, discuss the report's contents with officials from the Department of Transportation's Office of the Secretary and FHWA and the states we reviewed. Except as noted, we performed the review in accordance with generally accepted government auditing standards.

[2]Obstacles to Billboard Removal (CED-78-38, Mar. 24, 1978).

CHAPTER 2

STATUS OF OUTDOOR ADVERTISING CONTROL

It has been almost two decades since the Highway Beautification Act required states to control outdoor advertising. Thousands of illegal and nonconforming outdoor advertising signs have been removed based on the act's requirements, but many signs remain standing along the nation's interstate and primary highways. In recent years, the number of illegal and nonconforming signs being removed has been decreasing. On the basis of our review of seven states' programs, we found that sign removal has been hindered by the limited availability of federal funds, limited state resources, state sign-removal procedures which slow sign removal, and lack of support for the program. States appear to be giving higher priority to restricting the erection of new signs.

NATIONWIDE STATUS OF SIGN REMOVAL

Federal regulations (23 C.F.R. 750.705) require that states remove illegal and nonconforming signs along interstate and primary highways in order to effectively control outdoor advertising. According to FHWA data, most of the illegal and about half of the nonconforming signs have been removed, but about 172,000[1] of such signs remain standing. FHWA reported the following status of program activity as of September 30, 1983. These data represent the most recent comprehensive data available at the time of our review.

	Total	Removed	(percent)	Remaining	(percent)
Nonconforming signs	238,079	114,252	(48.0)	123,827	(52.0)
Illegal signs	520,197	472,445	(90.8)	47,752[a]	(9.2)
Total	758,276	586,697	(77.4)	171,579	(22.6)

[a]We are concerned about the reliability of the FHWA data on remaining illegal signs. These figures are based on data provided by the states. We found the data on remaining illegal signs to be unreliable for three of the seven states we reviewed. (See p. 14 for additional information.)

---

[1]According to FHWA officials, this figure includes signs that are nonconforming based on the requirements of the Highway Beautification Act but not signs that are nonconforming under stricter local sign control laws or ordinances. According to FHWA, about 38,000 signs in this latter category became eligible for monetary compensation because of the 1978 amendment to the act's compensation requirement. (See discussion, p. 22.)

As the following chart shows, the number of signs being removed has decreased in recent years. The total number of signs removed in fiscal year 1983 was lower than in any year since 1979 and down about 72 percent from the number removed in 1980.

SIGN REMOVALS SINCE 1979

REMOVING NONCONFORMING SIGNS WILL REQUIRE ADDITIONAL FEDERAL FUNDING

Under the Highway Beautification Act, removing nonconforming signs requires the payment of just compensation to sign and site owners. States are not required to remove nonconforming signs unless federal funds are available to share in the cost of compensation. Based on FHWA estimates, less than 10 percent of the nearly 124,000 remaining nonconforming signs could be removed with the remaining $15 million in unexpended federal funds. FHWA estimated that about $427 million in federal funds--more than has been spent on the program to date--would be required to remove these signs.

Most states indicated that the lack of federal funds had a negative impact on their sign-control programs. In response to our questionnaire survey, 29 states indicated that the lack of federal funds had a somewhat or very negative impact on their programs. Sixteen states reported that the lack of these funds had neither a positive nor a negative impact; 4 reported that it had a very positive impact; and 1 state did not respond to the question.

As the following charts show, nonconforming sign removals have decreased as federal program expenditures decreased. Nonconforming sign removals fell about 78 percent between 1979 and 1983. During the same period, federal program expenditures were down about 83 percent.

FEDERAL OUTDOOR ADVERTISING CONTROL EXPENDITURES

NONCONFORMING SIGN REMOVALS

State progress in removing nonconforming signs has varied greatly. The following chart provides information on nonconforming signs removed and remaining in the seven states we reviewed.

In four of the seven states we reviewed--Arizona, Georgia, Louisiana, and South Dakota--about 75 percent or more of the states' nonconforming signs remained standing. Five of the seven states (including Kentucky) did not have enough federal funds available to remove the remaining signs. The other two states--Maine and Oregon--had removed almost all of their nonconforming signs. (Maine removed its last nonconforming sign on June 7, 1984--see photograph, p. 10.) The status of nonconforming sign removal in Georgia and Louisiana demonstrates the impact of reduced federal funding.

--Georgia may be unable to continue removing nonconforming signs because federal funds for compensation are running out. The state had removed 1,009 (23.6 percent) of its nonconforming signs; 3,263 nonconforming signs remained standing as of September 30, 1983, according to FHWA data. State officials estimated that only 150 additional nonconforming signs could be removed with the remaining $975,776 in unexpended federal funds. This would leave more than 3,000 nonconforming signs remaining on Georgia's interstate

Officials removing the last nonconforming sign in Maine, June 7, 1984.

Source: Maine Department of Transportation.

and primary highways. State officials estimated that about $18 million in federal funds would be required to remove all of Georgia's remaining nonconforming signs.

--According to a state official, Louisiana's nonconforming sign removal program was discontinued in fiscal year 1981 because the federal government did not allocate sufficient funds to continue the program. According to FHWA and state officials, the state has not paid compensation for the removal of any nonconforming signs since that year. As of September 30, 1983, Louisiana had removed 283 (19.6 percent) of its nonconforming signs. A state official estimated that it would cost about $1.1 million (including the federal share) to remove the more than 1,000 nonconforming signs that remained as of that date.

The administration has not requested program funding since 1982

Since fiscal year 1982, the administration has not requested the federal funding which is necessary to remove nonconforming signs. According to an official from the Office of the Secretary, Department of Transportation, no funding was requested because the program was considered a low priority by the administration. Administration budget statements cited the increasing cost of paying compensation for the removal of nonconforming signs and possible program changes. In an October 5, 1983, letter, the Secretary of Transportation indicated that the Department was reviewing possible revisions to the outdoor advertising control program. As of October 1984, the Department was still considering program changes, according to officials from FHWA and the Office of the Secretary.

MANY ILLEGAL SIGNS REMAIN STANDING

Although federal regulations (23 C.F.R. 750.705(d)) require that illegal signs be removed expeditiously, it has been more than 18 years since the Highway Beautification Act was enacted and many illegal signs remain standing along interstate and primary highways. Removals of these signs have been decreasing in recent years. Unlike the decrease in the removal of nonconforming signs, the decrease in illegal sign removals is not attributable to reductions in federal funds because removing these signs does not require the payment of compensation. In our review of seven states' programs, we found that the removal of illegal signs has been hindered by limited state personnel, state sign-removal procedures which slow sign removals, and lack of support for the program. States will continue to be required to remove illegal signs, even if federal funds are not appropriated.[2]

---

[2]FHWA estimates that it would cost about $1 million in federal funds--for reimbursable administrative costs--to remove the remaining illegal signs.

As the following chart shows, removals of illegal signs have decreased since 1980. The 11,640 signs removed in fiscal year 1983 represented about a 73-percent decrease from the 43,228 removed in fiscal year 1980. Fewer signs were removed in 1983 than in any of the last 5 years.

State progress in removing illegal signs has varied greatly. Our review of the programs in seven states showed that some states had removed all or almost all of their illegal signs but that thousands of such signs remain standing in other states. As of September 30, 1983, Maine had removed all of its illegal signs and only 23 remained standing in Oregon, according to FHWA data. In contrast, over 2,000 illegal signs remained standing in Georgia and over 3,000 were standing in Louisiana as of that date.[3]

---

[3]The data on remaining illegal signs for the other three states we reviewed--Arizona, Kentucky, and South Dakota--are unreliable. Arizona reported to FHWA that 4,831 of its illegal signs remained standing, but this figure is based on an inventory that classified signs improperly. Kentucky and South Dakota reported that 6,171 and 41 illegal signs remained, respectively. However, these data are understated because Kentucky and South Dakota did not include new illegal signs that have been erected or identified. (See discussion, p. 14.)

On the basis of our review of the seven states' programs, we concluded that state support for the outdoor advertising control, state sign-removal procedures, and the availability of state resources are all factors affecting state progress in removing illegal signs. For example, we believe that the removal of illegal signs in Maine was facilitated by the state's longstanding support for outdoor advertising control and efficient state sign-control procedures. On the other hand, illegal sign removals in Georgia have been hindered by limited state personnel and state sign-removal procedures which slow removals. The Kentucky program appears to have been hindered by that state's lack of support for outdoor advertising control between 1980 and 1983. We obtained the following information regarding illegal sign removals in these states.

--Maine has evidenced longstanding support for outdoor advertising control: it enacted a sign-control law 30 years ago, prior to the enactment of federal outdoor advertising control requirements and it participates in the voluntary federal bonus program previously discussed. According to FHWA data, the state has removed all of its 5,120 illegal signs.

  Maine's sign-removal procedures seem to be efficient and effective. Current state law prohibits most off-premise signs on all roads in the state. Sign owners must remove illegal signs within 30 days of receiving notice from the state transportation agency. If the owner fails to comply, the state will remove the sign at the owner's expense without further notice or proceeding. According to state officials, this provision is rarely used because sign owners usually remove signs soon after they receive notice from the state.

--According to state officials, the removal of illegal signs in Georgia has been hindered by limited state personnel and state sign removal procedures which slow sign removals. The number of staff assigned to the outdoor advertising control program was reduced in response to state budget cuts, and sign removals are delayed until state personnel are available. Illegal signs cannot be removed without an administrative hearing, which can add 3 months to the removal process, according to state officials.

--The removal of illegal signs in Kentucky has been hindered by the state's lack of support for outdoor advertising control between 1980 and 1983. According to FHWA and Kentucky transportation officials, the state administration in these years did not support the program. As a result, in 1980 the state reduced personnel assigned to outdoor advertising control and decentralized program responsibilities.

  The number of illegal signs removed in Kentucky significantly decreased between 1980 and 1983. While 3,786 illegal signs were removed between 1976 and 1979, only 613 were removed between 1980 and 1983--including only 21 which

were removed in 1983. A new state administration, which took office in December 1983, established new sign control priorities that include the removal of illegal signs. In August 1984, FHWA officials told us that Kentucky has accelerated its removal of illegal signs.

--According to state officials, removing illegal signs is a low priority in Louisiana. They said that title searches for illegal signs are not given a high degree of attention and that removal of these signs is delayed until state personnel have completed higher priority tasks. As of September 30, 1983, only 2,277 (41 percent) of the state's 5,598 illegal signs had been removed. In August 1984, FHWA officials said that they had persuaded Louisiana to make removing illegal signs a higher priority. They said that the state had developed a plan for removing the remaining illegal signs.

Remaining sign data from some states are unreliable

Since 1978 FHWA has prepared an annual statistical progress report on the highway beautification program. This report contains state-by-state and nationwide data on the status of the outdoor advertising control. Included are data that are necessary for monitoring the effectiveness of outdoor advertising controls, such as data on removed and remaining nonconforming and illegal signs. We relied on these FHWA data because they are the only available comprehensive figures on the status of outdoor advertising control. As previously mentioned, however, we are concerned about the reliability of FHWA data on remaining signs.

According to FHWA headquarters officials, the FHWA report is based on data provided by the states. While we did not examine in depth the reliability of these data, we found the data on remaining signs to be incomplete or inaccurate for three of the seven states we reviewed. For example, the data for Kentucky and South Dakota are understated and the data for Arizona are based on a faulty sign inventory, on the basis of our review of state records and discussions with FHWA and state officials. The data for Georgia, Louisiana, Maine, and Oregon appear to be more reliable. Georgia and Louisiana update their sign inventories regularly. Maine and Oregon reported to FHWA that they have removed all or almost all of their illegal signs, and this was supported by state records and our observations. Information on the Arizona, Kentucky, and South Dakota data problems follows.

--Data on remaining signs that Arizona reported to FHWA are inaccurate. The data are based on a 1970 inventory which, according to FHWA and state officials, did not properly classify signs. The FHWA Arizona division administrator said that many of the signs listed as illegal are actually legal or nonconforming. A state official estimates that the actual number of nonconforming signs remaining was about 850 rather than the 4,992 signs reported as of September 30, 1983, in the FHWA inventory. The official also

said that the state started to conduct a new inventory in the mid-1970s but the project was never completed due to limited state resources.

--The number of illegal signs remaining that Kentucky reported to FHWA is understated because it does not include illegal signs that have been erected since 1972, when Kentucky completed its last sign inventory. While the number of illegal signs remaining in the state is unknown, FHWA and Kentucky officials agreed that there has been an increase in new signs along Kentucky's highways since 1980.

--The data on remaining illegal signs in South Dakota are understated because they do not include newly identified illegal signs. The state reported to FHWA that 40 illegal signs were removed in fiscal year 1983 and that 41 illegal signs remained as of September 30, 1983. The state report indicated that there were no new illegal signs in 1983; state documents showed, however, that sign inspectors identified 118 new illegal signs during that year. The state's sign inventory manager was unable to explain the discrepancy.

CONTROLLING NEW SIGNS

In addition to removing existing nonconforming and illegal signs, federal regulations (23 C.F.R. 750.705(a)) require states to prohibit the erection of new signs, other than exempted signs. Restricting new signs seems to be a high priority with the states. Of the 50 states, all but two--Indiana and South Dakota--have permit systems for the control of new signs. In the seven states we visited, we did not find any instances where sign permits were issued for signs that are not allowed under the Highway Beautification Act. However, some illegal signs continue to be erected in violation of state laws.

In response to our questionnaire survey, 22 states indicated that restricting the erection of new signs was their first outdoor advertising control priority. Seventeen other states listed it as their second, third, or fourth priority after removing illegal signs, removing nonconforming signs, or controlling the size, lighting, and spacing of signs. Eleven states indicated that they did not establish program priorities.

Forty-five states provided the following information on new legal signs erected in fiscal year 1983.

Type of new sign	Number
Signs in zoned commercial and industrial areas	8,810
Signs in unzoned commercial and industrial areas	4,712
Landmark, directional, or official signs (including logos)	14,044
Other or not specified	2,887
Total	30,453

We reviewed new sign permits in Arizona, Georgia, Kentucky, Louisiana, and Oregon[4] and found that new signs conformed to sign-control requirements. The signs were generally located in zoned or unzoned commercial and industrial areas. We did not find any instances where sign permits were issued for signs that are not allowed under the Highway Beautification Act.

While states are required to prohibit the erection of new nonexempt signs, new illegal signs continue to be erected in violation of state laws. For example, 109 illegal signs were erected in Georgia in fiscal year 1983. According to FHWA and state officials, most illegal signs in Georgia are small business directional signs and are usually erected on primary roads. The officials said that most of these signs are erected because of ignorance of the law; most small businesses are not aware of the state's permit requirements. Officials in Louisiana and Maine also said that most illegal signs in their states are small business or directional signs on noninterstate highways and were erected because their owners did not know about state restrictions. FHWA and Kentucky officials told us that there has been an increase in new illegal signs along Kentucky's highways since 1980 but that the exact number of new illegal signs is unknown because Kentucky has not updated its sign inventory since 1972.

---

[4]These five states had sign permit systems that provided information on new legal signs. South Dakota does not have a sign permit system, and while Maine has a permit system for official directional signs, the state does not allow most off-premise signs.

CHAPTER 3

FEDERAL OVERSIGHT AND STATE PROGRAM PROBLEMS

Although removing illegal signs and restricting new ones do not depend on the availability of federal funds, FHWA decreased its oversight of state outdoor advertising control programs when federal program funds decreased. As one FHWA regional administrator suggested, FHWA's deemphasis of the program may have contributed to relaxed state enforcement of federal outdoor advertising control requirements.

A 1983 FHWA field office review of state programs identified or restated problems with the state programs and suggested that some states were not effectively controlling outdoor advertising. For example, the review indicated that Arizona, Kentucky, and Louisiana were not removing illegal signs expeditiously, as federal regulations require. While the Secretary of Transportation has not penalized any state for a program infraction since 1977, FHWA has worked with some states in an effort to resolve problems with their programs.

FHWA OVERSIGHT DECREASED BETWEEN 1981 AND 1983

Prior to 1981, FHWA conducted regular headquarters reviews of state outdoor advertising control programs, according to FHWA headquarters officials. Between 1981 and 1983--when federal funding for outdoor advertising control was decreasing--FHWA deemphasized the highway beautification program, including outdoor advertising control. FHWA headquarters staff assigned to the program were reduced from nine to two, regular headquarters reviews of state programs were eliminated, and field reviews were discouraged. The agency adopted a more reactive oversight approach, leaving program administration to the states unless problems surfaced.

The following statement was delivered in 1981 by the FHWA associate administrator responsible for outdoor advertising control[1] at a meeting of the American Association of State Highway and Transportation Officials. It indicates that FHWA's oversight of state programs would be minimal.

> "As to the Beauty program--its future is at a standstill. The Washington Office is not making any reviews of the Regions' or Divisions' Beautification program operations. I would suggest that the Regions not make any reviews of the Division's Beauty program. I would suggest that the Division Right-of-Way Offices, until some other guidance is issued to you, not make specific reviews of the States' Beauty programs. If the Divisions get complaints, look into them and forward them to the Region and to the Washington Office for proper

---

[1]Associate administrator for right-of-way and environment.

> action. You cannot tell State highway agencies, or infer to them, not to enforce this Act, but until some direction is given to you, limit your overview. Other areas of right-of-way should receive your first attention."

This deemphasis of the program by FHWA may have contributed to relaxed state enforcement of outdoor advertising control requirements. In 1983--2 years after FHWA oversight had been decreased--the FHWA associate administrator directed an FHWA field office review of state programs because a growing number of problems had been surfacing in state programs. The review concluded that there was wide disparity in state attitudes toward and implementation of outdoor advertising control. Field office reports identified or restated state program problems and suggested that some states were not effectively controlling outdoor advertising. In his report on the 1983 review, one FHWA regional administrator linked state program problems to the decrease in federal oversight. His report stated:

> "It is our observation states have relaxed enforcement in the control aspect, especially at the administrative and management levels. States feel the program has been deemphasized by the Federal Government and it is no longer an active entity of the federal-aid highway program. This is evidenced by the expression of one state official who stated that FHWA would not impose any penalties for nonenforcement as long as they (the states) provided 'lip service.' Other states have expressed a feeling that, even if they were to pursue a strict policy in sign acquisition and control, FHWA would provide little support against a strong industry. Sign control inspectors have reported large companies erecting signs in known nonconforming and illegal locations with the thought that the beauty program was dead."

SOME STATES MAY NOT BE EFFECTIVELY CONTROLLING OUTDOOR ADVERTISING

On the basis of the previously discussed federal requirements and FHWA's 1983 review findings, we determined that some states may not be effectively controlling outdoor advertising. The FHWA review identified program deficiencies in four of the seven states we reviewed. Among other problems, information in review reports from FHWA's field offices indicate that Arizona, Kentucky, and Louisiana were not removing illegal signs expeditiously and South Dakota had unresolved zoning problems. FHWA reports on the other three states we reviewed indicate that these states had effective outdoor advertising control programs: Maine and Oregon had removed all or almost all of their nonconforming and illegal signs, and Georgia's program was significantly improved and effective. Information follows on the problems in Arizona, Kentucky, Louisiana, and South Dakota and on FHWA's efforts to resolve those problems.

Arizona

According to FHWA's 1983 program review, problems with Arizona's outdoor advertising control program included an inaccurate and incomplete sign inventory, inadequate regulations, and slowness in removing illegal signs. FHWA's previous reviews of the state's program--in 1975, 1978, 1979, and 1980--had cited problems with the state's sign inventory and sign-control regulations. On the basis of these problems, the FHWA Arizona division administrator said in his 1983 report that "there would appear to be grounds for warning the state that a penalty may be considered unless some progress is made." He added, however, that he was reluctant to recommend penalty action without a firm indication from FHWA headquarters that this was the proper approach because of the lack of federal appropriations for the program and the program's uncertain future.

FHWA recently wrote to Arizona in an effort to resolve some of the state's program problems. In an August 30, 1984, letter to the Arizona Department of Transportation, the FHWA Arizona division administrator reminded the state that it must continue to control signs and remove illegal signs in order to avoid the imposition of the 10-percent highway funding penalty. The letter also encouraged the state to improve its sign inventory.

Kentucky

As previously discussed, the number of illegal sign removals decreased in Kentucky between 1980 and 1983. According to FHWA's 1983 review, Kentucky was not removing illegal signs expeditiously, and many new illegal signs were being erected along the state's interstate highways. The state's removal of nonconforming signs was decreasing even though federal funds were available for compensation. However, according to FHWA officials, a new state administration appears to be interested in controlling outdoor advertising. They said that since the new administration has taken office, sign-removal activity has increased.

Louisiana

Louisiana has not been removing illegal signs expeditiously according to the 1983 FHWA review. About 3,300 (or 59 percent) of the state's illegal signs remained standing as of September 30, 1983. The FHWA Louisiana division reported: "It appears that the rate of removal of illegals is about equal to the number of new ones being erected." FHWA officials told us that FHWA has never penalized or threatened to penalize Louisiana for not having effective outdoor advertising controls. However, as previously discussed, FHWA has persuaded the state to develop a plan for removing illegal signs, and FHWA officials said that they will continue to monitor the state to ensure that the plan is implemented.

South Dakota

South Dakota was penalized about $3.4 million in 1973 and about $9.7 million in 1977 for not having effective outdoor advertising controls. According to the FHWA program coordinator, the state allowed strips of land along interstate and primary highways to be rezoned as commercial and industrial areas. FHWA would not recognize this zoning for outdoor advertising control because it believed that the zoning was designed to permit outdoor advertising and to circumvent the requirements of the Highway Beautification Act.

All but about $2.5 million of the above penalty amounts was restored on the basis of a 1973 federal/state agreement and a 1979 order by the Secretary of Transportation which stipulated that the state would enact complying legislation and remove certain signs at 100-percent state expense. However, in his report on the 1983 review, the FHWA Region 8 Director, Office of Right-of-Way, said that questionable strip zoning was still a problem in South Dakota and signs which should have been removed based on the 1973 and 1979 penalty agreement were still standing. He also said:

> "We agree with the Division's observation that the [South Dakota's] highway beautification program has been a minimum control program and has, perhaps, deteriorated further since the FHWA-[South Dakota] legal action in 1979. In fact, if a field review was to be made today it is likely the State would again be found out of compliance with Federal and State law. State outdoor advertising efforts have historically been directly proportionate to the degree of Federal pressure exerted, and there is no reason to believe . . . that this scenario will not continue."

As of August 1984, FHWA officials were working with South Dakota officials in an attempt to resolve problems with the state's sign control program.

USE OF THE FUNDING PENALTY

While problems with some states' programs continue and states report that the program's highway funding penalty encouraged outdoor advertising control, FHWA has been reluctant to use this enforcement tool in recent years. In response to our questionnaire survey, 47 states indicated that the penalty was a very great, substantial, or moderate incentive in the development of their sign-control programs. The remaining three states said that the penalty was little or no incentive. As shown on the next page, between 1973 and 1977 about $73 million was withheld from five different states because they did not have effective outdoor advertising controls. All but about $2.5 million was restored when the states agreed to take corrective action. Although states have been warned about the funding penalty, since 1977 no state has been penalized for not complying with federal outdoor advertising control requirements.

Outdoor Advertising Control Penalties[a]

State	Year	Federal-aid highway funds withheld but later restored	Withheld permanently
Alabama	1977	$12,390,285	-
New York	1977	34,361,957	-
Oklahoma	1977	6,094,014	-
South Dakota	1973	3,361,546	-
	1977	7,222,381	$2,505,103
Vermont	1973	7,318,063	-
Total		$70,748,246	$2,505,103

[a]See app. IV for additional information on these penalties.

When we asked FHWA headquarters officials why the funding penalty had not been used since 1977, they told us that the penalty is a difficult tool to use because it is too severe and inflexible. In June 1983, FHWA submitted proposed program changes to the Office of the Secretary which calls for replacing the 10-percent funding penalty with a more flexible enforcement provision. As of October 1984, the Office of the Secretary was still considering these changes. The proposed program changes also include limiting outdoor advertising control to rural interstate routes, eliminating the mandatory compensation requirement for the removal of nonconforming signs, and removing such signs within 5 years with discretionary federal highway funds.

CHAPTER 4

VIEWS ON THE EFFECTS OF THE 1978 AMENDMENT

The 1978 amendment to the Highway Beautification Act's compensation provision increased the cost of outdoor advertising control by increasing the number of signs that cannot be removed without compensation. The amendment requires that monetary compensation be paid in all cases in which nonconforming signs are removed, whether they are removed because of the Beautification Act's requirements or because of local requirements. States are subject to a highway funding penalty if they remove nonconforming signs without providing monetary compensation.

FHWA estimates that about 38,000 additional signs that do not conform to local laws or ordinances became subject to the act's compensation requirement because of the amendment. FHWA also estimates that removing these 38,000 signs would cost the federal government $334 million, in addition to the previously discussed $427 million that would be required to remove the 124,000 signs that are nonconforming because of the federal act's sign-control requirements. According to FHWA, had the 1978 amendment not been enacted, the 38,000 signs could have been removed under local laws or ordinances without the cost of compensation.

States varied in their views on the amendment and its effect on their sign-control programs. In addition, other affected groups and organizations expressed varying opinions on the amendment.

THE AMENDMENT'S EFFECT ON STATES AND LOCALITIES

While most states indicated that their state sign-removal programs were not affected by the 1978 amendment, they generally favored repealing the amendment. Of the 49 states that responded to our question on the effects of the amendment, 32 said that the amendment had no effect on their state's sign-removal programs and 17 said that the amendment hindered their programs. Nine of the 17 affected states said that the amendment hindered their programs because it precluded them from removing signs by amortization, without paying monetary compensation. On the other hand, when we asked the states whether they favored repealing the amendment, 27 indicated that they greatly or somewhat favored repeal; 10 states were somewhat or greatly opposed to repeal; and 13 states neither favored nor opposed repeal of the 1978 amendment.

We visited three localities--Dallas, Texas; Portland, Oregon; and Southampton, New York--that believed the 1978 amendment has hindered sign removal. Before the 1978 amendment was enacted, these localities had established sign controls through local zoning laws or ordinances that provided for the removal of nonconforming signs after amortization periods ranging from 3 to 10 years. At the time of our review, these periods had expired. The signs in Dallas and Portland remained standing--in part because of the 1978 amendment, according to local officials. After prolonged

and expensive legal proceedings, Southampton had the signs removed without providing monetary compensation even though FHWA had warned the state of New York that removing the signs without paying monetary compensation could subject the state to a highway funding penalty. Information on how the 1978 amendment affected Dallas', Portland's, and Southampton's sign-control programs follows.

Dallas

According to Dallas officials, the 1978 amendment and the lack of compensation funds have prevented Dallas from removing about 1,200 signs that could have been removed by May 1983 under the city's local sign ordinance (see photographs, p. 24). An April 1973 Dallas ordinance provided a 10-year period during which these 1,200 legally erected but nonconforming signs would have to be made conforming or be removed. These signs are still standing because under the 1978 amendment removing them would require the payment of monetary compensation and funds are not available for this purpose, according to city officials. These officials estimate that it would cost about $8 million (including the federal share) to pay for these 1,200 signs.

Portland

According to city officials, the 1978 amendment has hindered sign removal in Portland by requiring the payment of monetary compensation at a time when federal compensation funds are not available. A 1959 city ordinance required that nonconforming signs be removed without monetary compensation after a 10-year amortization period. In 1976, an outdoor advertising company challenged the constitutionality of this ordinance, claiming, among other things, that the ordinance did not provide for compensation to sign owners. In 1977, the U.S. District Court for the District of Oregon ruled that the amortization period could be considered just compensation. In 1979, however, after the Highway Beautification Act's compensation provision was amended, the district Court reversed its decision and ruled that Portland must pay monetary compensation to sign owners when removing nonconforming signs.

One hundred and thirty-five signs that would have been removed by amortization have been left standing in Portland. A city official told us that it would cost about $500,000 (including the federal share) to remove the remaining signs. However, federal highway beautification funds were not available to pay the 75-percent federal share of compensation costs. City officials stated that the city could provide the remaining 25 percent if federal funds were available.

Southampton

While Dallas' and Portland's nonconforming signs remain standing, Southampton had its nonconforming signs removed without providing monetary compensation under its local ordinance, which bans all off-premise signs. Although the 3-year amortization

Dallas signs that were not removed after the 1978 amendment.

period provided by local ordinance expired in 1975, Southampton's 25 nonconforming signs were not removed until March 1984. The 1978 amendment hindered the removal of Southampton's signs, according to town officials.

Legal challenges brought by sign companies based on constitutional issues delayed removal of the signs until 1978. After the passage of the 1978 amendment, local sign companies again challenged Southampton's ordinance, opposing the town's right to remove by amortization signs located on federal-aid primary routes.

In October 1983, the New York Court of Appeals ruled on the Southampton case:

> "Notwithstanding the amendments of the federal Highway Beautification Act of 1965 . . . compensation need not be paid by a municipality which requires removal of outdoor advertising signs, provided a reasonable amortization period is allowed by the removal ordinance."

Final judicial approval to remove the signs came on March 2, 1984. The next day, after 9 years of litigation and legal costs of about $100,000, Southampton had the signs removed.

Federal/state/local conflict over sign removal

As Southampton's ordinance progressed through the New York courts, FHWA twice informed the New York State Department of Transportation (NYSDOT) that the state would be penalized if Southampton's signs were removed without compensation. FHWA's warning put the state in conflict with New York's zoning and police authorities, according to state officials. In a letter to FHWA, NYSDOT's commissioner said that the penalty should not be levied against the state because

--home rule rights are protected by the Constitution and New York statutes and

--New York's highway beautification law, approved by FHWA, does not prohibit localities from passing more restrictive ordinances.

NYSDOT's commissioner also said that the state should not be penalized by FHWA for the actions of a locality exercising home rule rights, particularly when federal funds have not been available for paying monetary compensation for nonconforming signs.

Faced with the loss of up to $70 million in highway funds, NYSDOT opposed the removal of Southampton's signs by amortization. At NYSDOT's request, the New York State attorney general joined the sign companies in their court challenge against Southampton's ordinance. NYSDOT also attempted to amend New York's law

to prohibit removal of signs on federal-aid routes unless compensation is paid by the locality. Both of these attempts failed.

Although Southampton removed its signs without paying monetary compensation, as of August 1984, FHWA had not penalized New York. FHWA provided New York with federal compensation funds for the Southampton signs, and NYSDOT has offered to pay the local sign companies $75,000 for the signs removed by Southampton. FHWA believes that with this offer New York remains in compliance with the 1978 amendment. However, federal compensation funds are no longer available, according to FHWA officials, and other New York localities are planning to remove signs by amortization.

VIEWS OF OTHER AFFECTED GROUPS AND ORGANIZATIONS

Officials from the Garden Clubs of America, National Coalition to Preserve Scenic Beauty, National League of Cities, Sierra Club, and Travel Information Centers, Inc., favored repealing the 1978 amendment. The American Automobile Association was generally opposed to providing monetary compensation for sign removal. An official representing the Sierra Club said that the organization favors repeal because amortization is a legal and fair form of compensation. He said that the amendment has burdened states with restrictions at a time when no federal funds are being appropriated and signs have been left standing as a result of this situation. A National League of Cities official said that the 1978 amendment has restricted the use of local power and created a tremendous financial burden for localities.

Officials from the National Electric Sign Association and Roadside Business Association favored retaining the amendment. Roadside Business Association officials said that the 1978 amendment was passed to clarify the intent of the Congress. They said that the amendment closed a loophole in the original act, which allowed nonconforming signs to be removed without compensation by claiming that the removal was not related to the Highway Beautification Act.

The U.S. Department of Transportation opposed the enactment of the 1978 amendment at the time it was being considered by the Congress. In an August 17, 1978, letter which was included in the Congressional Record, the Secretary of Transportation said that the amendment "would produce a profound change in the direction of the Highway Beautification Program and would undermine efforts to control scenic blight along our highways." He said that the change "would represent an unprecedented intrusion by the federal government into the prerogatives of localities to control land uses within their jurisdiction" and "local authorities would be inclined to leave signs up rather than pay compensation and therefore undermine their own zoning laws." He further said that where monetary compensation was not paid for sign removal, states could become subject to the federal highway funding penalty--even though some states do not have the authority to bind local jurisdictions. An official from the Office of the Secretary told us

Special Report: The Highway Beautification Act

Lewis Launches Sweeping Billboard Reform

Rep. John Lewis

A quarter century after our nation passed the Highway Beautification Act of 1965, Rep. John Lewis (D-Ga) has introduced the most sweeping legislation ever proposed to remedy basic flaws in the law and stop the construction of new offpremise billboards along America's federal roads.

The 1965 law was supposed to "preserve natural beauty" and clean up billboard blight, but in what Reader's Digest called the "Great Billboard Double-Cross," instead the industry has used loopholes in the law to build hundreds of thousands of new, bigger billboards.

If passed, Lewis' legislation, introduced on October 2, 1989, as H.R. 3389, will be the first reform of the law in twenty-four years. "The Beautification Act was created to control and remove nonconforming billboards along our nation's federal aid highways," Lewis notes. "However, the billboard industry has been successful in getting the legislation watered down. As a result, our highways are becoming polluted by more billboards."

H.R. 3389 would:

1) place a moratorium on the construction of new billboards on federal highways

2) allow state and local governments to decide for themselves how to take down existing billboards

3) eliminate the provision of the current bill that requires taxpayers to pay billboard companies to remove billboards

4) prohibit the billboard industry from destroying trees to improve the visibility of billboards

5) require annual state inventories of billboards along federal aid highways and an annual report by the U.S. Department of Transportation based on these inventories and

6) provide for the removal of all nonconforming billboards in existence after September 1, 1995.

Lewis notes that the General Accounting Office (GAO) and the Department of Transportation's Inspector General both indicate that new billboards are now being erected at least three times faster than old ones are coming down.

"Billboard control is an environmental and public health issue and it is a state and local control issue," adds Lewis. "The billboard industry has had far too much control over this issue for too many years. It is time we give this control back to the states and local communities who are working diligently to protect their environments," he concludes. *SA*

Why the Billboard Industry Loves the Beautification Act

By Charles F. Floyd

Passed with much fanfare in 1965, the Highway Beautification Act was supposed to remove existing billboard clutter from rural roadsides and prevent its future spread. How effective has the Act been in achieving its objectives? The billboard industry gives us the definitive word. A press release by the Outdoor Advertising Association of America hailed the act as: "The Highway Beautification Act: A Law That Works!" They applauded its virtues, rapturously extolling: "Taxpayers can only dream that every law that Congress passes works as well as the 1965 Highway Beautification Act."

Because it is obvious that if the act were really working, the billboard lobby would not be praising it, we must ask ourselves: Why does the outdoor advertising industry love the Highway Beautification Act?

The explanation is simple. The program has been ineffective both in preventing the spread of billboard blight in areas it was supposed to protect and in removing existing billboards in these areas. The law contained fatal defects when it was passed, Congress has further weakened it with subsequent amendments, and the Federal Highway Administration (FHWA) has almost completely abdicated its enforcement responsibilities. FHWA has discontinued any compliance reviews of state programs and failed to take corrective action even when documentation of flagrant violations is presented.

Loopholes Permit New Billboards in Protected Areas. The Highway Beautification Act was supposed to permit new billboards only in areas where there were actual commercial or industrial uses. One need only to travel the nation's highways to observe that the Act has not accomplished this objective. Today thousands of billboards can be found in wetlands, woodlands and farm-

"Beautification" Act Uglifies Neighborhoods

By Representative John Lewis

"You've Come a Long Way, Baby"? The glamorous Virginia Slims model pictured on a billboard in the inner city poses a double irony. First, the words obviously equate smoking with women's liberation. Second, the designer outfit, towering over dilapidated stores and littered streets, tries to convince young women that smoking is an alluring escape.

Every day, in big cities and small towns across America, children on their way to school are greeted by billboards telling them that the way to be happy and get ahead is to drink beer and smoke cigarettes. The male movie star or the temptress in a bikini advise that Colt 45 "works every time." Athletes pictured in fresh-air environments kick, bat, or climb to hawk cigarettes along smog-filled streets.

One federal law has moved cigarette ads off the airwaves and another--the Highway Beautification Act--has helped strew these same ads into our neighborhoods. As a result, the campaign started by Lady Bird Johnson to clean up billboards in the countryside has moved into town. With inadequate federal controls, local communities are moving to control billboard pollution. Hundreds of *("Beautification", continued on page 8)*

Jane Zenger, Billboards Limited

Children in many neighborhoods are constantly exposed to tobacco and alcohol ads such as this billboard in the front yard of a Houston rental house.

Scenic America Viewpoint

The Forgotten Environmental Law

When the Johnson Administration first considered creating a highway beautification program, it was meant to herald a "new conservation" era. The environmentalism of Teddy Roosevelt and Gifford Pinchot had its roots in using natural resources--albeit efficiently--rather than preserving land for its own sake. But in the wake of books like Rachel Carson's Silent Spring (1962), Stewart Udall's Quiet Crisis (1963), and Peter Blake's God's Own Junkyard (1964), this environmental ethic seemed insensitive to the effects of manmade pollution and the need to conserve disappearing open space.

Inspired by Lady Bird Johnson (see page 5), the Johnson Administration began work in 1964 on comprehensive policies to preserve "the natural beauty of the nation." These included additions to the park system, creation of a Land and Water Conservation Fund, a wilderness system, and a wild river system.

To this end, Johnson assembled an eleven-member task force on natural beauty, including such noted Americans as Laurance S. Rockefeller, Jane Jacobs, Loren Eisley, John Kenneth Galbraith, and William Whyte. In his message on natural beauty in February 1965, the President asserted that the nation should "introduce into all our planning, our programs, our building and our growth, a conscious and active concern for the values of beauty." Specific programs included billboard controls, clean air legislation, and a White House Conference on Natural Beauty to launch these programs. Henry Diamond, who later served with President Reagan's Commission on Americans Outdoors, called the May conference "a major transition--a bridge from the traditional conservation to the new environmentalism and the start of something grand."

The Highway Beautification Act was to be the opening wedge. A quarter of a century later, our nation has seemingly adopted the "new conservation." The clean air act, clean water act, and wilderness laws passed in the wake of the new mandate are fundamentally strong. But the Highway Beautification Act--the idea that started it all--is in shambles--a forgotten environmental law.

Certainly many factors were at play, including the fact that no national organization coordinated citizen support while the billboard lobby orchestrated its allies into monolitic opposition.

Even President Johnson -- the great power broker -- underestimated the power of the billboard lobby, which used the same tactics in 1965 they use today--including generous campaign contributions, offers of free "public service" ads on billboards, and other less subtle methods of persuasion.

For years many environmentalists remembered only that the law had passed *(Viewpoint, continued on page 10)*

SCENIC AMERICA, a nonprofit organization (501c3), is the only national group devoted solely to protecting scenic resources and cleaning up visual pollution. If you want to work for meaningful controls on visual blight, you can join Scenic America, formerly the Coalition for Scenic Beauty.

Membership fees are $20 per year for individuals, $50 for local/state organizations, and $100 for national organizations. To join, send check payable to "Scenic America" to: Scenic America, 216 7th Street, SE, Washington, DC 20003; (202) 546-1100.

Billboard Controls: Communities Fight Back

Despite the failure of the Highway Beautification Act, the fight to control billboards is continuing on the local level, with hundreds of communities battling to protect their visual character.

Over just the past four years, more than 500 cities and counties have enacted new regulations to control the proliferation of billboards. Today over 1,000 U.S. cities and counties totally prohibit billboards, as do the states of Vermont, Maine, Alaska, and Hawaii.

In every case these local and state ordinances were adopted over fierce opposition from the billboard industry. Below are brief summaries of recent development in some communities.

- **Birmingham, Alabama,** passed a strong billboard control ordinance in August 1989.
- **Winston-Salem, North Carolina's** city council voted in January 1989 to prohibit new billboards along the I-40 bypass.
- **Orange County, California,** in August 1987 Santa Ana became the 21st city in Orange County to restrict billboards. Billboards were already banned in 20 other Orange County cities, on all highways and freeways south of Irvine and the Pacific Coast Highway.
- **Richmond, Virginia,** in November 1988, banned new billboards everywhere in the city except along interstates.
- **Virginia Beach,** Virginia's largest city, enacted a February 1987 ban on all new billboards and now prohibits existing billboards from being replaced.
- **Clearwater, Florida,** citizens successfully petitioned the city council in December 1988 for the removal of all billboards along a major commercial boulevard.
- **Indianapolis** passed a strengthened sign ordinance in May 1988 requiring an increase in setback from residences, parks, hospitals, schools and churches.

Over just the past four years, more than 500 cities and counties have enacted new regulations to control the proliferation of billboards.

- **Philadelphia** in April 1988 voted to prohibit all billboards within 600 feet of the Vine Street Expressway. The city had earlier voted to prohibit billboards in historic districts and in neighborhood commercial districts.
- **St. Louis** voted to ban the construction of all new billboards within the city after a survey found almost three times more billboards in black neighborhoods than in white.
- **Houston,** in an effort to increase its ability to compete as a place to live, has designated scenic corridors in which existing signs must be removed.
- **Palm Beach County, Florida,** in October 1988 banned new billboards in the county and voted to remove more than 300 existing billboards in unincorporated areas. Thirty of the county's 37 municipalities including Boca Raton, Delray Beach and Palm Beach also ban billboards.
- **King County, Washington,** in May 1988 banned new billboards and required removal of all billboards blocking views of Mount Rainier, Mount Baker, the Olympic Mountains, Puget Sound, lakes, and rivers. The ordinance creates "billboard-free" areas within 600 feet of parks, historic sites, open space, and scenic resource lands.
- **Louisville, Kentucky,** in March 1988 made the 37-mile long Gene Snyder Freeway a billboard-free scenic parkway. The city council also approved establishment of numerous scenic corridors and established a 500-foot setback from parkways, parks, landmarks, and historic districts.
- **Denver** passed an ordinance in June 1988 capping the number of billboards, requiring the removal of one existing sign of equal size for every new billboard erected.
- **Jacksonville, Florida,** voters overwhelmingly endorsed a ballot referendum in May 1987 banning all new billboards and requiring all existing billboards on city streets be removed within five years. *SA*

Should our Roadsides Look Like This . . . . . or Like This?

Billboards like those at left cost advertisers thousands per month, while small logo signs (right) provide motorists with readily available travel information at a fraction of the cost to the advertiser.

Billboards: Small Industry with a Big Lobby

Billboard advertising is a small industry with a big lobby. In 1988 the industry had revenues of $1.4 billion which it says it generated from about 500,000 billboards.[1]

Industry revenues account for only 1% of total advertising expenditures in the United States. The industry itself is very small. According to the U.S. Census Bureau, only 12,290 people were employed in "outdoor advertising" nationwide in 1985.[2]

Today, ten companies dominate the industry accounting for almost 70% of the billboards in the country. The largest firms operate more than 40,000 billboards in multi-state markets and take in more than $200 million in annual revenues.

While the billboard industry itself is small, it has one of the nation's largest and most powerful lobbies. The Outdoor Advertising Association of America (OAAA) has offices in almost every state and employs highly paid lobbyists.

The industry trains its executives to use a set of standardized tactics honed through years of experience. Elizabeth Drew, in the December 1965 issue of Atlantic Monthly, wrote, "The Outdoor Advertising Association has been urging its members to get themselves on local planning and zoning boards and their wives to infiltrate garden clubs. It instructed them to offer free billboard space for good causes (Easter Seals, et al), 'to spotlight the public-spirited cooperation of your medium.' And it is widely acknowledged that the billboard companies are in a position to offer political candidates – local and national – *not* only campaign funds at election time but billboard space, free or at a discount." The industry has today refined the same tactics to an art.

Today the billboard lobby dispenses hundreds of thousands of dollars annually in campaign contributions and speaking fees. Billboard companies regularly pay $1,000 to $2,000 fees to Congressmen and staffers for speeches given during all-expense-paid trips to industry meetings in Palm Springs, Hawaii and other fashionable resorts.

Between 1983 and 1988, the industry paid Members of Congress more than $640,000 in honoraria – only defense contractors and the tobacco industry paid more. The billboard industry paid millions more in campaign contributions.[3]

When billboard companies donate free ad space, there is almost always an ulterior motive. Billboard public service announcements are a public relations ploy designed to undermine genuine community concern about the ill effects of billboards. One industry publication discussed the reasons for giving away ad space by saying, "it would be difficult for the mayor (or other politicians) to sponsor or support anti-billboard legislation or ordinances if he/she had been actively using outdoor advertising for their own projects."[4]

A typical tactic is to approach nonprofit organizations with offers of free ad space. In return, the industry typically asks these groups to oppose local billboard controls. For example, if a local elected official calls for tighter billboard controls, the industry will go to his favorite charity or cause, offer the group free ad space and then ask the organization to testify against or at least write a letter opposing the regulations.

Likewise, whenever the U.S. Congress is about to consider legislation, the industry uses the same tactic. For example, shortly after the Reagan Administration endorsed reform of the HBA in 1986, the industry approached Nancy Reagan to offer free billboards for her "Just Say No to Drugs" campaign. Scenic America Profile

Lady Bird Johnson: First Lady of the Environment

By John Deeth

The Highway Beautification Act is forever linked in the minds of the American public with Lady Bird Johnson. The former First Lady, however, did more than plant flowers in public places. She served the country superbly by planting environmental values in the minds of the nation's leaders and citizens.

Lady Bird Johnson *Scenic America*

In a recent book titled Lady Bird Johnson and the Environment, historian Lewis L. Gould credits Lady Bird Johnson with laying the foundation for the ecological movement of the 70s: "Having a First Lady who said that the Grand Canyon should be preserved, that redwoods should not be cut down, that parks should be saved and freeways built with urban residents in mind, meant that environmental issues received a statement of legitimacy and value from the White House." Indeed, Secretary of Interior Stewart Udall called her a second Secretary of Interior in the White House. In addition to having the President's ear, she captured the imagination of people around the world who had never thought about the environment.

Mrs. Johnson recently told Scenic America that her interest in beautification is "a natural result of a life-long love affair with nature, with the beauties of our diverse country, and with walking country roads and exploring mountain trails." She brought that love to her campaign to save our scenic heritage.

Her interest in highway beautification legislation began around the time Lyndon Johnson became President in late 1963. "We all know the difference between a road that beckons and a road that depresses," she declared in 1964. Mrs. Johnson's concern sparked the President to action. Shortly after the 1964 election, he called Secretary of Commerce Luther Hodges and said: "Lady Bird wants to know what you're going to do about all those junkyards along the highways."

The Johnson Administration, while firmly committed to highway beautification, reportedly felt forced to make concessions on the language of the bill because of the clout of the well-heeled billboard lobby (which insinuated itself into Johnson's staff) and the fact that the Administration was losing sway on Capitol Hill in the wake of the Vietnam War. Even in its watered-down form, passage seemed uncertain.

At this point, President Johnson put his full weight behind the bill. One Administration insider quoted the President as saying, "You know, I love that woman and she wants that Highway Beautification Act. By God, we're going to get it for her."

Lady Bird Johnson actively lobbied Members of Congress for the Highway Beautification Act, an unprecedented role for a First Lady. Even Eleanor Roosevelt never attended legislative strategy sessions or actively pushed for legislation.

Despite its flaws, the Highway Beautification Act was a victory that wouldn't have happened without Lady Bird Johnson. She deemed it a promising start. But in 1986, aware of the inroads made by the industry into the law and its enforcement, Lady Bird broke a decade-long silence about the act to call for its reform. Joined by Laurance Rockefeller, who had chaired the White House Conference on Natural Beauty which proposed the Act in 1965, Lady Bird said: "The Highway Beautification Act which we proposed to Congress some twenty years ago needs to be strengthened to control the spread of billboards."

More than anyone Lady Bird Johnson recognizes that the goal of making America's highways more beautiful will take great effort. "I think we're always working on our problems and they're always changing. And our job is to try to make the general movement forward," says Mrs. Johnson.

Lady Bird continues her commitment to beautification today as founder and leading light of the National Wildflower Research Center in Austin. "Wildflowers are the stuff of my heart," Lady Bird explains. It is understandable how she inspired President Johnson to proclaim that "beauty must not be just a holiday treat, but a part of our daily life." That lesson will be her greatest legacy. Reform of the Highway Beautification Act would be a fitting new bouquet for this beautiful lady. *SA*

Industry

(Continued from page 1) lands, on open prairie, mountain meadow, even in the middle of the desert—in many cases, miles from the nearest exit, town, or building.

Why are so many new billboards going up in our supposedly protected rural countryside? Although the Highway Beautification Act ostensibly prohibited new billboards, it excepted all land zoned industrial or commercial and all land deemed unzoned commercial or industrial areas. These exceptions have swallowed the rule and thus thousands of new billboards have been erected under the Act. This has happened in several ways.

First, many communities, particularly rural counties, have stripped zoned long stretches of rural roads as phony "commercial" and "industrial" zones, thereby permitting the erection of numerous billboards in totally rural areas where scenic beauty was supposed to be protected.

Second, under the gaping "unzoned commercial or industrial area" exception, all a billboard firm needs in order to put up new billboards in unzoned areas is to find, or even build, some obscure commercial or industrial activity—perhaps a utility shed, a small beauty shop, a country store or a campground, that happens to be located near a "protected" highway.

The law also has failed to control the size or height of billboards. The HBA does not limit the height of billboards along federal highways and it allows billboards four times larger than the "standard poster panel."

Because of such loopholes, and counter to the public's original expectations when the Highway Beautification Act was passed, today billboards on the rural highways of most states are much bigger, taller, and more intrusive than those twenty-four years ago. What's more, the GAO and the Inspector General tell us that currently more billboards are going up than coming down in many areas.

Abuses in the Removal Program. Communities have traditionally cleaned up billboard pollution by requiring that nonconforming signs be removed *after* a period of years. Almost all courts have held this to be adequate and fair compensation for sign owners, particularly because the offending signs can be moved to other more appropriate locations. Nevertheless, unlike other nonconforming uses, the Highway Beautification Act requires taxpayers to pay cash for all signs removed along federal highways. This is the only federal environmental legislation that allows polluters to continue polluting until they are paid to stop.

The removal program was made even more ineffective by the policy of first paying to remove signs that were voluntarily offered by their owners. The billboard companies used this provision to unload obsolete signs that were no longer economically viable. The money received was used to erect new billboards in other locations. A Department of Transportation study concluded that the policy produced very little in the way of aesthetic improvement, despite the expenditure of more than $200 million.

The greatest triumph for the billboard industry has been to use the cash payment requirement to deny state and local governments their traditional right to remove nonconforming signs through the use of their regulatory powers. Today, nonconforming billboards located on interstate or federal-aid primary highways are protected from forced removal by the Highway Beautification Act. Thus, the billboard polluters are protected by the supposed anti-pollution legislation.

Tree Destruction. Perhaps the ultimate perversion of the beautification program is its use as a justification for destroying trees on the public right-of-way in front of billboards. When the interstates were built, the FHWA provided money to plant millions of trees along our roadsides. Billboard companies didn't like trees blocking the view of billboards so in 1977, it persuaded the FHWA to legalize tree destruction by reclassifying it as "vegetation control." State officials now annually issue thousands of treecutting permits to sign companies. Many of the trees being destroyed were originally planted under the federal landscaping program.

Not only has this legalized vandalism destroyed hundreds of thousands of publicly owned trees, but a study by the (Industry, continued on page 9)

FACT SHEET: BILLBOARDS AND THE ENVIRONMENT

"The concept of the public welfare is broad and inclusive. The values it represents are spiritual as well as physical, aesthetic, as well as monetary."
– William O. Douglas

"Pollution is not limited to the air we breathe and the water we drink; it can equally offend the eye and ear."
– Warren Burger

VISUAL POLLUTION IS AN ENVIRONMENTAL ISSUE – John Muir said, "people need beauty as well as bread." But while America spends billions of dollars cleaning up air pollution, water pollution, even noise pollution, we have largely ignored the visual pollution that blights our neighborhoods and mars our countrysides. Today, hundreds of thousands of billboards are going up, at record pace, all over America. They threaten to turn our landscape into a continuous outdoor commercial.

Grassroots Concern – In many communities, particularly in the South, billboards are the leading grassroots environmental issue. Over the past four years more than 500 cities have enacted new regulations to control billboards. Concerns about billboards unite diverse interests: businesses, historic preservationists, minority residents and citizens concerned about health threats from alcohol and tobacco billboards.

Paying Polluters – Today the so-called Highway Beautification Act is the only federal environmental regulation that requires taxpayers to pay the polluter to stop polluting. Yet, despite spending almost $250 million, taxpayers see thousands of new billboards being erected under loopholes in the Act.

Land Use – The billboard industry continually attempts to subvert local land use and zoning controls. These efforts undermine dozens of environmental and public health and safety regulations which depend on the validity of local land use authority.

National Parks and Historic Sites – Roads adjacent to national parks and historic sites are becoming corridors of commercial blight. Billboard clutter degrades the experience of park visitors and ruins the settings of our national landmarks. For example, the causeway leading to the Chincoteague National Wildlife Refuge/Assateague National Seashore, once a magnificent panorama of sea and marsh, is now a mile-long billboard alley.

Herbicides – The billboard industry routinely sprays herbicides on public land in front of billboards to kill existing vegetation and to ensure that nothing grows up in its place. The indiscriminate destruction of trees and use of herbicides contribute to groundwater pollution, soil erosion, and depletion of the ozone layer.

Tree-cutting – The billboard industry is systematically destroying millions of trees on public land to ensure that motorists see their signs instead of our scenery. For example, in Louisiana more that 2 million pine trees planted with federal money are being destroyed in 500-

Atlanta Journal-Constitution

foot clearcuts in front of thousands of roadside billboards.

VISUAL POLLUTION IS A PUBLIC HEALTH ISSUE – The two leading users of billboards are tobacco and alcohol. Today, more than 300,000 Americans die each year from smoking-related illnesses. Another 100,000 deaths result from alcohol abuse and drunk driving. Yet our cities, particularly low-income neighborhoods, are being saturated with billboards advertising cigarettes and booze.

No Standards – The billboard industry exercises almost no restraint on the siting of billboards. They simply put billboards anywhere and everywhere they can. Today, thousands of billboards can be found next to homes, schools, churches, parks, playgrounds, health centers – literally everywhere.

Low-Income Neighborhoods – Low-income neighborhoods have become dumping grounds for intrusive outdoor advertising. There are more billboards per capita in black and Hispanic neighborhoods than in white neighborhoods and two-thirds of the billboards in black neighborhoods advertise tobacco and alcoholic beverages. For example, a 1987 survey conducted in St. Louis found almost three times as many billboards in black neighborhoods as white.

VISUAL POLLUTION IS A GOOD GOVERNMENT ISSUE – The billboard industry is America's leading unregulated polluter. The reason is simple: lots of money is being spent lobbying, wining and dining elected officials. Over the past six years the billboard industry paid Members of Congress more than $640,000 in honoraria. This is the third largest amount paid by an American industry. What's more, the $640,000 does not include millions spent on PAC contributions, individual contributions from billboard industry executives or free billboard space donated to candidates for elected office.

VISUAL POLLUTION IS A PRIVACY ISSUE – Billboards are an inherently intrusive form of advertising which violates our constitutional right of privacy. Other forms of advertising can be eliminated at the flip of a switch or the turn of a page, but there is no possible way to turn off a billboard. Twenty-four hours a day, 365 days a year, billboards, many as big as houses, impose their messages on a "captive audience" – the American public.

VISUAL POLLUTION IS A BUSINESS ISSUE – Many cities and states rely heavily on natural beauty and visual quality to attract businesses and tourists. Billboards serve only to intrude on the landscape of America and devalue our nation's greatest physical asset – its natural beauty. *SA*

Billboard companies escape property taxes

River Reporter, Newburgh, NY

Local communities are losing almost half a billion dollars in annual revenues because billboard companies around the country escape paying property taxes or shortchange local tax collectors, according to a Scenic America survey of a dozen cities in different states across the nation.

The survey shows that in many cases billboard companies simply never list their billboards on tax rolls or undervalue them so much that they pay as little as $6 per sign in annual property taxes on signs that earn as much as $100,000 a year.

However, when cities want to remove these same signs, the industry demands *10 to 100 times the declared value in public monies* as payment—as much as $250,000 per sign.

Scenic America executive director Ed McMahon says, "In many communities people pay more for dog licenses than billboard companies pay in permits or taxes. Billboards are ruining the scenic character of America. They should at least be made to pay their fair share of taxes." Case studies include:

- **Jefferson County, Missouri:** Tax assessor Ron Dougherty, shocked to learn that billboards were not being taxed at all, announced on July 14 that the assessing of billboards and other signs will add nearly $3 million to the Jefferson County valuation and lower tax rates for some taxpayers.
- **Jacksonville, Florida:** In July billboard companies were notified that they owe $2.3 million in back taxes for billboards that were undervalued or missing from the tax rolls.
- **Raleigh, North Carolina:** A recent investigative series by the Raleigh News & Observer concluded that "probably thousands" of billboards across the state are not on the tax rolls as required by law, and that others are grossly underpaying taxes. In checking twelve counties, the newspaper uncovered 341 billboards not listed on tax rolls in 1988. Even those listed were assessed at one-half of original construction cost -or one-half the value at which all other personal property is taxed.
- **Gainesville/Alachua County, Florida:** County commissioner Penny Wheat found that the biggest billboard company in the county paid only $1,414.63 in property taxes last year. Wheat counted 120 billboards belonging to this company and figured each was paying about $10 a year in taxes. On average in Alachua County, $25 in taxes are paid per every $1,000 in assessed value; Wheat extrapolated that the appraiser therefore was valuing the boards at around $800 each—or one-percent of the $40,000 plus sought by billboard companies in cash payments for removal of each of the same boards.
- **Houston** has delayed work on I-610 for several years because Texas has refused to buy a billboard in the way. One sign at Loop 610 and Old Katy Road is valued at $19,042 by the state but at $288,000 by the company that owns it. It is on the property tax rolls at $10,580.
- **San Francisco, California:** The San Francisco Examiner ran a front-page report on December 27, 1988 concluding that billboard companies in the city gross an average of $60,000 a year for each billboard but pay only about $19-26 in taxes.

In addition to underpaying property taxes, billboards are given other unfair tax advantages. Unlike motorists and truckers, the industry pays no road user taxes, tolls or fees to use publicly funded highways, from which billboards derive their value.

Today, the American taxpayer is in a triple jeopardy situation. First, taxpayers pay billions to build and landscape highways. This investment is then devalued by billboard companies that turn our roads into outdoor commercials. And finally the public is forced to pay to remove the billboards it never wanted.

Free guidelines for citizens wishing to check whether billboards pay their fair share of taxes in their communities are available from Scenic America. *SA*

"Beautification"

(*Continued from page 2*) cities big and small have passed their own sign control ordinances in the past decade.

But whatever happened to the Highway Beautification Act—Lady Bird's attempt to reduce billboard pollution? Tragically, the 1965 law has been gutted by the industry it was supposed to regulate and transformed into a Billboard Protection and Taxpayer Ripoff Act. Although the law called for removal of billboards along federally funded interstates and primary highways, billboard lobbyists obtained a clause saying that no billboards could be removed unless the companies were paid to remove them—with taxpayer dollars.

After getting other loopholes allowing new billboards to despoil rural roads, the industry next went after urban areas. In 1978 hardball lobbyists won an amendment requiring use of additional taxpayer money for signs removed along federal aid roads under local ordinances and zoning laws. As a result, cities cannot remove billboards on a number of their major streets and highways.

Just as toxic waste dumpers have tried to use poor Southern communities as dumping grounds for their wastes, billboard companies are using inner-city neighborhoods as dumping grounds for their pollution. This pollution consists of ads unwanted elsewhere because of both the message—smoke and drink—and the medium—unsightly billboards that lower neighborhood property values and discourage upscale businesses.

Nationwide, tobacco and alcohol form a third of all outdoor ads, but the percentage climbs to two-thirds or more in low-income and minority neighborhoods. The 1989 Surgeon General's report and billboard surveys in Atlanta; Detroit; St. Louis; Washington, D.C.; San Francisco; and New Orleans confirm that advertisers are targeting their marketing efforts at blacks and Hispanics.

(*"Beautification," continued on Page 11*)

. . . but Collect Millions in Unnecessary Cash Payments

The most anti-auto, counterproductive and constitutionally unnecessary provision of the Highway Beautification Act is the requirement that taxpayers pay billboard owners cash to remove nonconforming billboards.

Billboard companies argue that "just compensation" must be paid for any sign taken for public purposes. The courts, however, have long held that billboard regulation is not a taking of private property and does not violate the Fifth Amendment of the Constitution.

Courts say the government interest in billboard regulation is especially strong because billboards don't derive their value from the private land on which they stand but from the public roads they stand next to.

What's more, billboards are a form of movable personal property rather than real property. Personal property includes tools of the trade, like trucks, fences, computers and typewriters. Real property is non-movable assets like buildings and land.

The billboard industry argues that removing a sign is like towing away a house and that cash payment is due. Indeed, while many billboards are as big as houses, this analogy is false. Billboard regulation is really like telling someone who parks a dump truck in your front yard to move it. Taxpayers don't pay millions of dollars to move trucks or any other nonconforming land use, we shouldn't have to pay to move billboards.

Congress never intended to give the billboard industry the free ride it now enjoys. Until industry-sponsored amendments to the act passed in 1978, states and local governments were fairly compensating companies by "amortizing" signs. Amortization provides a justifiably extended grace period during which a billboard continues to generate income before its removal. During this time, billboard owners can earn additional hundreds of thousands in revenue from each illegal or nonconforming billboard.

The GAO estimated in 1985 that, without changing the 1978 "cash payment" requirement, taxpayers would be forced to pay billboard owners more than $420 million to remove existing nonconforming billboards. Today that amount could reach $1 billion. Ironically, despite such huge expenditures, hundreds of thousands of "conforming" billboards would continue to stand along our roadways and more billboards are going up every day. Isn't it time to treat the American taxpayer fairly and stop these unnecessary cash payments? *SA*

Industry

(Continued from page 6) Department of Transportation's Inspector General concluded that the policy had also hindered the removal program by giving thousands of nonconforming billboards new life; otherwise the signs would have been abandoned because they would have been obscured by vegetation growth. Even so, the HIWA has refused to change the policy.

Why the Billboard Industry Loves the Highway Beautification Act. From this brief discussion it should be painfully obvious why the billboard industry loves the Highway Beautification Act. The law has not achieved its stated objectives. It serves more to protect the billboard companies than to regulate them. The Highway Beautification Act is a regulated industry's dream: regulation that regulates the regulators and the public rather than the industry.

It is time to end this national disgrace, to rescue the Highway Beautification Act through effective enforcement and corrective legislation. The iconic beauty of this nation must be restored to the people who have paid for our highways, not destroyed by the billboard barons who exploit our roadways for their own selfish gains. *SA*

Charles F. Floyd is a professor in the Department of Real Estate and Urban Planning at the University of Georgia.

Highway Beautification Act Guidelines

The 1965 Highway Beautification Act passed to control billboards along our nation's highways has not accomplished its goals of preserving natural beauty and enhancing the recreational value of vehicular travel.

It has failed because it is riddled with loopholes which allow new, enormous billboards to go up almost anywhere. A review of Highway Beautification Act Regulations reveals why the current law is a totally ineffective tool for protecting the scenic integrity of our cities and countryside.

HBA REGULATIONS	Proposed in Federal Register January 28, 1966	Final guidelines
Maximum number of billboards/mile on:		
Interstate	6	42
Primary-rural	6	70
Primary-cities	6	212
Maximum size:		
Rural	300 sq. ft.	1200 sq. ft.
Urban	300 sq. ft.	3000 sq. ft.
Maximum height:	30 feet	no limit
Setback from right-of-way:	25 feet	none
Setback from local, state or national parks:	none	none
Setback from historic sites or districts:	none	none
Setback from schools or churches:	none	none
Prohibition of destruction of trees on public land near billboards:	none	none
Blocked out zone at exit:		
Rural	2,000 feet	500 feet
Urban	2,000 feet	none
Allowable square footage per mile on:		
Interstate	2,400	25,200
Primary-rural	2,400	42,000
Primary-cities	2,400	127,200

Viewpoint

(Continued from page 2) and figured that it had done whatever could be done. Other towns entered more important and more glamorous, and Washington-based environmentalists don't have billboards in their front yards. But people in many communities across the country do. In these communities billboards are the major environmental issue and a potent public health issue as well because of the pitchers of tobacco and alcohol ads.

Today, public interest in the forgotten our 'monumental law is mounting, as people witness the systematic destruction of our scenic heritage. They are angry that the law has been perverted into a billboard industry-welfare act. They find it incredulous that the Highway Beautification Act has become the only environmental law that requires taxpayers to pay the polluter to stop polluting. They are shocked when they see massive clearcutting of trees to clear the view in front of billboards.

They realize that even if we cleaned up our air and our water completely, much of our country would still not be worth living in because of what we have done to the land. Who can see "America the Beautiful" when it is hidden behind long rows of giant billboards and buried under acres of asphalt?

Scenic America was formed in the belief that environmental protection includes more than clean air and water. We are the only conservation group devoted exclusively to protecting the *visual and scenic quality* of our environment. We agree with John Muir that "people need beauty as well as bread." In fact, community appearance has proven so integral to the quality of life that many Chambers of Commerce have found that they lose bread when they lose beauty—an ugly community drives away businesses, tourists, and new residents.

Billboard control is an issue that can bring together businesspeople, environmentalists, and health and minority leaders. It is a bipartisan issue in Congress despite the support garnered in the past by the industry.

In the Blueprint for the Environment submitted to President Bush, the nation's major environmental organizations recently called for "reform of the Highway Beautification Act to help remove visual pollution and blight from America's scenic roadsides."

Lewis has taken a courageous stand to do just that, to give the forgotten environmental law a new life and a new leading role in environmentalism.

—EL

"Beautification"

(Continued from page 8) Although all tobacco and alcohol advertising has come under scrutiny, billboards are uniquely harmful. They are impossible to ignore—you can't turn the page or change the channel. You may see a magazine ad for cigarettes once, but if they saturate your neighborhood with billboards, you'll see the same ad 30 times a day, every day.

Children are a captive audience to billboards. Even before they can read, kids admire the bigger-than-life Marlboro cowboy. Unlike the print media, the billboard industry doesn't screen ads for readers under 18. They will put billboards virtually anywhere: next to homes, schools,, playgrounds, churches, hospitals, historic sites and cemeteries—even across the street from the Martin Luther King grave site in Atlanta.

The Highway Beautification Act has done little to stop this assault on our neighborhoods. It ties the hands of cities trying to clean up on their own. Therefore, I have introduced legislation to repeal loopholes and reform the Act. H.R. 3389 restores the power of states and communities to regulate billboards using their zoning authority and puts a moratorium on new billboards on federal highways. It's about time the Highway Beautification Act started beautifying America instead of polluting America. *SA*

WHAT YOU CAN DO TO HELP SAVE OUR SCENERY

- **JOIN SCENIC AMERICA:** If you are not a current member, now is the time to join. If you are, please send the largest contribution possible to help in the fight to protect the scenery and character of our cities and countryside.

- **WRITE YOUR ELECTED REPRESENTATIVES IN CONGRESS:** Each member is urged to ask his/her representative to cosponsor H.R. 3389, the Billboard Control Act of 1989 introduced by Rep. John Lewis.: Hon. (your Rep's name), House of Representatives, Washington, D.C. 20515; (202) 224-3121. Also write Chairman Norman Mineta to urge hearings on H.R. 3389: Hon. Norman Mineta, Chairman, Surface Transportation Subcommittee, B-376 Rayburn, U.S. House, Washington, D.C. 20515.

- **JOIN SCENIC AMERICA'S LEGISLATIVE ALERT PROGRAM:** To double the effectiveness of your letters, send copies to us and be listed on the network for timely alerts and local action. You can also request information on past voting records.

- **COORDINATE LOCAL EFFORTS** through Scenic America to document billboard industry practices in your area. Volunteer as a local coordinator and/or send us photographs. The publications below will help your community efforts.

____ Visual Pollution & Sign Control: A Legal Handbook on Billboard Control, $15
____ Set of factsheets, $5
____ **Total (please add $2.50 for Postage and Handling)**

Special Report: The Highway Beautification Act

HOW MANY BILLBOARDS ARE THERE IN AMERICA?

Billboards are bigger and taller than they were when the Highway Beautification Act was passed in 1965, but how many billboards are there in America? No one knows for sure because there has been no comprehensive national inventory since the 1960s.

H.R. 3389, the legislation to reform the 1965 law highlighted in this special report, calls for such an inventory while placing a moratorium on new billboard construction on federal highways.

In the September 15, 1989 Los Angeles Times, the billboard industry admits to 500,000 billboards today and claims that the HBA has more than cut the number in half from 1.2 million in 1965. The 1965 inventory included signs of every description along federal roads, while the industry's current estimate of 500,000 does not count the thousands and thousands of illegal billboards going up along our federal highways at a record pace. Nor does it include state, county, and city streets where there is an even more explosive growth of hundreds of thousands of billboards. Metropolitan Los Angeles billboards, for example, are estimated at 22,000 by those in the city.

Although it is true that many signs have come down because of the Act, a vast majority of those came down in the early years of the program. Removals of nonconforming billboards are at a virtual standstill since funds dried up in 1982—only 537 nonconforming billboards came down in 1987 according to the Federal Highway Administration (FHWA).

Both the General Accounting Office and the Department of Transportation inspector general's office have indicated that billboards are going up at least three times faster than they are coming down during the 1980s. They express great doubts about the reliability of the state data on which the FHWA bases its assessments of compliance with the Act.

The Inspector General's office says, "The Outdoor Advertising Control program has been ineffective in improving highway beautification as the number of signs located adjacent to the nation's highways continues to increase"—with boards going up 2 to 4 times faster than they are coming down in some states.

The GAO reported that in 1983 nationwide taxpayers paid to remove 2,235 billboards that were "nonconforming" ads built before enactment of the 1965 Act, while 13,522 new conforming billboards went up in the same year—6 times more.

The FHWA keeps billboard statistics only on illegal signs and nonconforming signs, but not on the hundreds of thousands of so-called conforming billboards, new and old, along our federal aid highways or the hundreds of thousands of billboards along city streets and state highways.

You can count apples and oranges many different ways, but no one knows the exact number of billboards. H.R. 3389 is a start at finding out through a good federal inventory. SA

ADDRESS CORRECTION REQUESTED

NONPROFIT ORG.
U.S. POSTAGE PAID
WASHINGTON, D.C.
PERMIT NO. 1854

Mr. McMahon. And also in response to your question, Mr. Lewis, we also believe in free choice. We think that if the voters in a community choose freely to eliminate billboards, then the Federal Government shouldn't prevent them from doing that, and that's happening all over the country.

Mr. Lewis. In a democratic society, do you think people have the right to pollute and harm others?

Mr. McMahon. I don't think we have a right to pollute. I think we have a right to be free of intrusive advertising, and I think we also have a right to privacy, a fundamental right to be left alone. You can't play a boom box on the Metro. Why should you be forced to look at a billboard if you don't want to?

Once again, people are voting all over this country to remove billboards. That's an exercise of their choice. Voters in Jacksonville, Florida, in a voter referendum, voted to tear down every billboard in the city, but then they can't do it because the Federal Government won't let them do that. That's the denial of their free choice.

Mr. Lewis. I noticed just a few days ago, reading the New York Times, that in Harlem apparently people felt—and the city of New York—that people were not moving fast enough to control the proliferation of billboards, and a group of religious leaders, a group of ministers, took to the streets on a Sunday morning and tried to take some action.

Is there a growing movement in America to control the proliferation of billboards?

Mr. McMahon. Well, there is certainly a growing movement to control the proliferation of billboards. One of the witnesses talked about 500 cities in the last three years. There is also growing frustration with the failure to control billboards, and I think that what happened in New York and what is happening in Chicago and Philadelphia, where people are actually taking direct action against billboards, whitewashing them, painting them over, chainsawing them, is an example. We are certainly not advocating this, but it is an example of how frustrated people are.

Mr. Lewis. Dr. Floyd, it's good to see you here from the University of Georgia. Good to see you again.

Attorney Merritt, I really appreciate all of the assistance and all of the support that the Trust has been in trying to protect the historic landmarks in my own district, trying to prevent the Presidential Parkway from being built. We appreciate all of that support.

Dr. Floyd, since you are a Professor of Real Estate at the University of Georgia, how is the value of a billboard determined for tax purposes?

Mr. Floyd. Congressman, that varies, but first I would like to say that it certainly pleases me as a southerner to see another southerner interested in trying to do something about this problem. For so long we in the south felt like we had to do anything and everything and allow ourselves to be ravaged in any way in order to promote economic development. We have finally learned, I think, that ugly is not good business, that that's not real economic development. We are learning that it is quality communities that are able to have economic growth, not those that are junked up.

The question about valuation of billboards is a rather complicated one. It really shouldn't be, I suppose. If we go to property taxes, we find that billboards are taxed at very, very low rates. Let me give you an example.

In North Carolina last year, after the Raleigh News and Observer did a series of articles showing that many billboards were not taxed at all or taxed at extremely low rates for property taxes, the State Revenue Department put out a cost schedule for billboards, for valuation. Billboard company property taxes went up anywhere from 400 to 800 percent in North Carolina counties when they were valued on a simple cost schedule.

Now, one thing that is interesting about the Highway Beautification Act is—well, one thing I remember Senator Muskie was asked was what would be the compensation. He said, "Well, it would only be the unamortized portion of the sign." Of course, 25 years later—particularly since billboard companies are allowed to depreciate their signs over—I think now it is eight years, but it has been as short a period as five years, I believe, during the 1980s—since these billboards were depreciated way down, you would think now they would kind of be gone. Or that if you were paying compensation, that you would pay compensation based on the original cost. That's not the case. If we're paying compensation, we're paying it on what the costs would be today. So you might have a billboard that cost $1,000 back in 1960, say, and now we're saying, well, you've got to pay $10,000, $15,000 for it. But even that isn't enough. The billboard companies are coming in and saying, "No, you're not supposed to pay us for the value of our sign. We also want to be compensated for the value of our business." In other words, all the revenue that that sign is producing.

In one of the really ironic cases that I read about recently, in Minnesota where the State courts have said that if the Highway Department acquired land and there was a billboard on it, all they were required to pay the billboard company were moving expenses because it was personal property. But the court said when the signs were removed under the Highway Beautification Act, because of the language in that act, not only was the company entitled to the value of its sign in replacement costs, but also lost income.

So here we have, again, this act which meant that in that case, Minnesota had to pay far, far in excess of what the original cost of the signs was, and even far, far in excess—I think it was like three times—the value, the actual value of the signs today. And that doesn't make sense to me.

Mr. MINETA. Will my colleague yield?

Mr. LEWIS. Yes, Mr. Chairman.

Mr. MINETA. Dr. Floyd, I'm just wondering—if compensation, however it may be determined, is to the fair market value, why wouldn't that be taken into consideration?

Mr. FLOYD. Well, Congressman, I think——

Mr. MINETA. I'm not a lawyer, but it just seems to me—I mean, if you have an automobile accident and the other person is at fault, they are to compensate you. But if you earned x number of dollars a month, shouldn't you be compensated for that if you're going to be losing that potential income because you are now hospitalized or laid up or permanently disabled?

Mr. FLOYD. Congressman, I believe a better analogy would be if somebody hit your car, say, destroyed your car, and you were using it for business. You wouldn't be compensated on the basis of, "Oh, this car will earn me a certain amount of money over the year." They pay you for a new car and you go out and buy one.

Mr. MINETA. For the car, but what about for you?

Mr. FLOYD. Sir, I don't believe that that analogy really holds for billboards. In eminent domain proceedings—and I'm not an attorney either, but I have worked with a number of the States on the valuation of billboards—when you are acquiring property, we're not talking about a similar situation to that. And the business—we're not taking the business, and most States don't compensate for business loss, potential business loss, in eminent domain proceedings.

Of course, the point is, I would contend, that in appraisal there is something called the "principle of substitution," that nothing is worth more than what it costs to replace it. And if you get replacement cost for a billboard, you can put it up somewhere else and get a similar income stream. So it's not income that is lost forever. It is income that you can replace.

Similarly, if you used an automobile in your business and it was destroyed or in some way the Government took it, if they gave you funds for another one, you could then use it in your business. And to me, that's the correct analogy.

Mr. MINETA. I thank my colleague.

Mr. LEWIS. Thank you, Mr. Chairman. I don't have another question. I yield back my time, Mr. Chairman.

Mr. MINETA. Very well.

To all of you who have stayed until this very late hour, thank you very, very much for your testimony here today.

[Ms. Pavley's prepared statement appears on page 922.]

[Mr. McMahon's prepared statement appears on page 898.]

[Mr. Floyd's prepared statement appears on page 866.]

[Mr. Barkley's prepared statement appears on page 726.]

[Mrs. Driscoll's prepared statement appears on page 846.]

[Ms. Merritt's prepared statement appears on page 908.]

Mr. MINETA. Let's see. The committee will reconvene on March 20, at 10:00 a.m. in room 2167, this very room.

Again, thank you very much. The subcommittee stands adjourned.

[Whereupon, at 9:35 a.m., the subcommittee was adjourned, to reconvene on Tuesday, March 20, 1990, at 10:00 a.m.]

PREPARED STATEMENTS OF WITNESSES

THE AMERICAN INSTITUTE OF ARCHITECTS

STATEMENT OF

PAUL H. BARKLEY, AIA

ON BEHALF OF THE

AMERICAN INSTITUTE OF ARCHITECTS

- BEFORE THE

U.S. HOUSE OF REPRESENTATIVES

SUBCOMMITTEE ON SURFACE TRANSPORTATION

OF THE

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

MARCH 15, 1990

Mr. Chairman, and members of the Subcommittee, my name is Paul Barkley of Barkley Pierce Architects, an architectural firm in Falls Church, Virginia. I am a former member of the American Institute of Architects' Board of Directors and a past President of the Virginia Society of Architects. The AIA is the professional association representing the nation's architects. The AIA has 56,000 members and this year celebrates its 133rd anniversary. We appreciate the opportunity to offer our views in support of Rep. John Lewis' bill, H.R. 3389, to reform the Highway Beautification Act.

INTRODUCTION

The Highway Beautification Act is a failure. It has been captured by the very industry whose excess it was designed to curb. It desperately needs reform, and H.R. 3389 will accomplish it. We hope that the Subcommittee will incorporate this bill into the legislation you will craft to reauthorize the post-interstate surface transportation program.

The AIA supported the original Highway Beautification Act. We are deeply involved in our communities in shaping sign ordinance. Architects care about the control of signage because billboard clutter create damages the environment, undermines sound urban planning, detracts from good architecture, and hurts business. Any community bent on improving its image as a good place to live, work, and do business begins by cleaning up its signage. Signage well integrated into our urban settings and compatible with the landscape can be a public asset. Uncontrolled signage is blight and,ironically, not very useful to the advertisers who want their messages noticed.

I can speak not only as an architect but also as a past President of the Falls Church Chamber of Commerce and as a former Chairman of the Falls Church Business Development Commission.

The AIA sponsors design assistance to localities at their request through a program called R/UDAT - Regional Urban Design Assistance Teams. We have helped over 100 communities determine design solutions for neighborhoods, historic districts, downtown commercial areas and other community locations which have special urban design needs. A facet of the planning for these places has been the issue of sign control. Through our experiences in urban design and planning in everyday practice and through the R/UDAT's the AIA and its members have gained valuable insight into how signage should work in our cities and towns.

The AIA appreciates the role of signage in our everyday lives. But for the public good, controls over sign placement, size, configuration and other features are necessary to balance the public's need for information with other equally important values. That's the principle behind the current federal law. Unfortunately, the current law destroys this balance, weighing the scales heavily toward the interests of the billboard industry. The Act is today a public policy outrage and the loudest voice in favor of it belongs to the billboard industry.

The Act encourages sign construction along federal highways. It shoves aside localities' traditional authority to regulate signage through zoning powers. It frustrates good community planning and design. It allows the sacrifice of

publicly paid for trees and shrubs to billboard visibility. It blocks the removal of signs that are supposed to come down. In short, the Act operates just as the billboard industry hopes it would.

AMORTIZATION VS. CASH COMPENSATION

As a result of a 1978 amendment, the current law requires that cash be paid to an owner to compensate for the removal of a non-conforming sign. A non-conforming sign is one that was legal when constructed, but is no longer legal due to a subsequent change in local, state, or federal law. The Act itself rendered thousands of signs non-conforming. Today the Federal Highway Administration estimates that as many as 100,000 non-conforming signs remain standing. There could be many more.

The cash compensation requirement is deceptive because it appears so reasonable. In fact, it is a cynical, unjustifiable barrier to sign removal. It relies on the inability of governments at all levels to divert scarce budget dollars to sign removal. Should a sign's removal be so necessary that a state or locality will come up with the cash payment, the owner can take advantage of loopholes in the law to erect another sign just down the road from where the first sign over stood. The federal government has refused to appropriate any funds for sign removal since 1983.

By requiring cost compensation for removals, the Act gives special treatment to the billboard industry by denying state and localities their ability to use the traditional means of getting rid of non-conforming uses - amortization. Through amortization, a use is allowed to remain standing for a certain period of time usually five to seven years - during which the revenue it receives

adequately compensate the owner for any economic loss. Amortization as a method of compensation has been tested repeatedly in state courts, including the California Supreme Court, and in federal courts, and repeatedly affirmed. According to the Federal Highway Administration, 385 non-conforming signs were removed in FY1989. At this rate, it would take over 200 years to remove just today's non-conforming signs. They'll sooner fall down from old age.

The AIA believes owners should be compensated for the removal of non-conforming signs. The Act, however, requires no compensation for a sign erected illegally, a provision we feel is reasonable. The issue is what kind of compensation for non-conforming signs is fair and accomplishes the purpose of sign removal. Amortization works; cash compensation does not. H.R. 3389, repeals the cost compensation requirement, returning to states and localities their authority to determine how to get rid of non-conforming signs. It would allow existing non-conforming signs to remain standing for five years. During this time, these signs would take in sufficient revenues to compensate owners for their loss. Owners would be compensated, but through the use of their billboards, not through the public treasury.

MORATORIUM ON NEW SIGNS

The number of signs along federal highways has grown alarmingly - three times faster than they are coming down according to both the General Accounting Office (GAO) and the Department of Transportation. That's because the law encourages signage, particularly through the "unzoned commercial and industrial areas" loophole. Although signs are not permitted along areas zoned for residential or farm land purposes, zoned and unzoned to be commercial or industrial places can legally draw new signage. A 1985 GAO report documented how unzoned areas are established, with billboard companies planting gas pumps in cornfields and writing "district headquarters" on the side of sheds.

A major problem is that billboards seem to go up just about anyplace -- around historic places, outside churches and schools, at dangerous curves in the roadway, and overlooking many minority urban neighborhoods where their messages for alcohol and tobacco are especially targeted.

As the number of signs has grown, so has their size. The average sign in 1963 was 15 feet tall and 300 square feet. Now they rise an average of 50 feet and block the landscape with 672 square feet of space, about the dimensions of a two-bedroom apartment.

H.R. 3389 would bring a halt to this nonsense by placing a moratorium on all new off-premises billboard construction along federal highways. State or local signs would remain unaffected, as would state logo signs, state sponsored business identification signs, historic signs, and all signs on the premises of a business. The idea of a moratorium will no doubt produce an outcry from the billboard industry, posing as the champion of small business. The claim is that billboards are essential economic tools, pointing motorists toward necessary businesses and services. This would be a powerful argument if it were true. It's not. The fact is that more than 85% of all billboards promote a product and almost half push alcohol and tobacco. Advertising Age has stated that in 1988, eight of the ten largest billboard advertisers were either alcohol beverage or tobacco companies.

A moratorium is not a radical proposal. The Republican Senate approved one when it passed tough highway sign controls in 1986. Ugliness does not aid a local economy or help business. That's why many places dependent on tourism

have banned billboards entirely or imposed moratoria, including Virginia Beach, Virginia, Lake Tahoe, California, Hilton Head, South Carolina, Hawaii, Maine, and Vermont. Since 1985, more than 500 cities and counties have toughened their sign controls, and in places where billboards have sprouted like weeds such as Houston and Philadelphia, the business community is in the forefront of the sign control fight. My own community of Falls Church brought down its last billboard years ago. We are an attractive community and our economy is strong.

TREECUTTING

One of the most tragic failures of the current act is that it elevates billboard visibility above trees and other roadside vegetation. The Act does nothing to curb the widespread practice that permits billboard companies to go onto public right of way, often with state permits, to cut down trees and other publicly paid for landscaping so that their signs can be more easily seen. Twenty-one States currently permit this abuse of our natural environment and the taxpayers' money. In Louisiana, the GAO documented that "thousands of trees have been destroyed." Between 1974 and 1984, just along Interstate 75 in Michigan from Flint to Saginaw, 1200 trees were cut down in front of billboards. H.R. 3389 would stop this abuse.

ANNUAL INVENTORY

An accurate count of signs along the federal highway system is a valuable public policy tool. It would provide the federal government with data to measure the effectiveness of sign controls. All parties to the sign control debate acknowledge that the current data is inadequate. H.R. 3389 would provide an annual survey.

Mr. Chairman, this concludes my testimony. I'll be happy to answer any questions you may have.

BOB BARTLETT

Statement
Of The
Construction Industry Materials and
Services Suppliers Coalition
To The
Subcommittee on Surface Transportation
Of The
U. S. House of Representatives
On The
Reauthorization of the Post-Interstate
Surface Transportation Programs

Mr. Chairman and members of the Subcommittee I am Bob Bartlett, President of the National Stone Association, and immediate past Chairman of the Construction Industry Materials and Services Suppliers Coalition. This coalition, commonly referred to by its acronym, "CIMSSC," is composed of national associations representing firms that provide the materials, goods and services that are used in the construction of our national infrastructure. These include firms that provide: coal ash, concrete pipe, ready-mixed concrete, engineering services, construction equipment, asphalt, sand and gravel, corrugated steel pipe, lime, crushed stone, portland cement and producers of welded wire fabric, wire reinforcement of concrete and other construction materials. CIMSSC is a coalition of suppliers of construction materials and services ranging in size from small, family-owned businesses to large publicly-held, corporations representing more than 700,000 employees nationwide with operations in every part of the country. Our perspective on the reauthorization of the federal surface transportation programs is somewhat unique and we are pleased at the opportunity to present our views.

The members of CIMSSC are excellent examples of basic industries which have evolved through difficult times to provide the raw materials and engineering service needs of our

nation's infrastructure replacement and rehabilitation. Our firms are keenly aware of our nation's total reliance on a sound infrastructure and we commend the subcommittee for initiating the reauthorization process at this time in order to allow for a full airing of views and the building of a true and unfettered consensus on this important issue. We are cognizant of the value of our transportation system because we know we cannot do without it; we are equally aware of the significant undertaking of this subcommittee because the federal highway program is at a very important junction. We hope our testimony proves useful and we will be glad to work with you and the members of the subcommittee in the coming months.

The users of the federal highway system are entitled to roads and bridges that are safe, durable and cost effective. As suppliers to the construction industry, we are at the beginning of the infrastructure "supply chain." Therefore, we feel a special responsibility to point out that in reauthorizing the Federal-aid Highway program we should look not only at providing adequate funding, but at getting the top value for the public's investment in the system.

We are concerned about the erosion of America's competitive edge due to the deterioration of our transportation modes. It has been said, "the economy of this nation becomes stagnant unless someone, somewhere, sells something." While that may be deemed a truism from basic course in economics it is nonetheless self-evident that nothing can be sold unless it is first manufactured. The accumulation of raw materials for that manufacturing process and the shipment of products to markets demand an efficient surface transportation network. Simply put, our economy is only as good as our collective ability to move factors of production to our nation's plants and facilities and finished goods to the marketplace. For this we need a sound infrastructure, including serviceable roads and bridges.

According to The Road Information Program (TRIP), there are areas of the country where delivery costs for both goods and services have increased by 25 percent because key roads and bridges have been closed in recent years due to deferred maintenance or

construction. The cost of truck runs increase from 10 to more than 100 percent due to roads that are unable to handle the loads and weight limitations on bridges that are in disrepair. This leads to additional costs related to capacity which affect the workers downstream at factories, distribution points and offices whose jobs cannot be completed on time when a delivery is stalled in traffic.

National Competitiveness

When it comes to defining the relationship between advances in highway transportation and economic growth and improved standards of living, Thomas McDonald, who headed the Bureau of Public Roads from 1919 to 1953, could have been speaking on behalf of CIMSSC members some years ago when he said: "We were not a wealthy nation when we began improving our highways . . . but the roads themselves helped us create a new wealth, in business and industry and land values . . . so it is not our wealth that made our highways possible. Rather it was our highways that made wealth possible."

Members of the Construction Industry Materials and Services Suppliers Coalition are living proof of McDonald's foresight:

- CIMSSC members produce the building blocks of the country's public works, including highways; and

- CIMSSC members are also uniquely dependent on the capability of highways -- consisting of these building blocks -- to deliver these very building blocks to points where they are needed to build new highways.

Today, unfortunately, CIMSSC members are in the precarious position of having to deliver their vital building blocks on decaying highways -- to rebuild those same decaying highways!

It is of some consolation to CIMSSC members that 327 leading economists, under the auspices of the Economic Policy Institute, recently warned Congress that:

> (I)f America is to succeed in an increasingly competitive world . . . We must fix our bridges and airports . . . The future will not wait . . . Each year of delay means . . . more deterioration in our roads, bridges, and airports. It means falling behind another step in the race for the technologies that will support tomorrow's higher incomes . . . We urge you to raise the monies needed to regain America's competitive edge -- before it is too late.

In testimony before the Joint Economic Committee earlier this year, renowned economist James Tobin of Yale University addressed America's "third deficit" -- the infrastructure crisis. The economist stated his support for additional investment in public infrastructure and the user-fee principle. Tobin urged: "substantial additional resources for public infrastructure investments, which should, as is often possible, identify and charge the users and beneficiaries . . . For example, trucks should pay for the wear and tear they cause to highways."

Another witness at the July 19, 1989, hearing -- Merrill Lynch Chief Economist Donald Straszheim pointed to America's disinvestment in its essential infrastructure, stating:

> Infrastructure spending seems to be regarded as substantially discretionary, at least in the short run. Therefore, when public sector budgets are tight, infrastructure spending is sacrificed. At best we paint over the rust and patch the pot holes -- the cheaper, short run solution. Only as a last resort -- and often when it is far more costly -- do we tear down, build from scratch and resurface the roadway.

A 1987 study by economist David A. Aschauer of the Federal Reserve Bank of Chicago tells us that the expenditure of monies called for by the 327 concerned economists will -- by

lowering the costs of private business and thus raising its rate of return -- actually stimulate four to seven times as much private investment. Specifically, he pointed out that:

> A root cause for the decline of the competitiveness of the United States in the international economy may be found in the low rate at which our country has chosen to add to its stock of highways . . . which aid in the production and distribution of goods and services . . . We as a country should be vitally concerned with the viability of our economic lifelines that enable us to meet the challenge of an increasingly competitive world marketplace.

At the public policy level, the General Accounting Office's recent report, New Directions for the Nation's Public Works, supports these private views ". . . increases in personal and business income . . . become available, as a result of highway projects, for financing investment and consumption purchases generally. The lower costs of transportation may also open up new business opportunities."

In the long-run, it all comes back to the origin of America's highway system as an economic device -- to get the farmer out of the mud and to move goods efficiently to the ultimate consumer.

Federal-Aid Highway Program Funding Requirements

We are well aware of the argument that our federal budget deficit requires cutbacks in federal transportation assistance. It is a national disgrace, however, that 42 percent of our bridges are classified as structurally deficient or functionally obsolete by the Federal Highway Administration and 60 percent of our roads are rated substandard. We believe that Congress must provide for a surface transportation system that will restore America's ability to regain its economic status.

We are firmly convinced that the users of our transportation system are willing to accept higher user-fees in return for an adequate system that will enable us to be fully competitive in the world market. In fact, at the 1989 Annual Meeting of the U.S. Chamber of Commerce, more than 80 percent of the participants stated they would support higher user-fees if they were earmarked for transportation improvement.

Highway Trust Fund Should Be Used for Its Intended Purpose

CIMSSC believes that the Highway Trust Fund should be made permanent and the excise taxes which accrue to it be used only for highway and bridge construction and improvement.

The basic objectives of the Federal-Aid Highway program, set out in 1956, were to provide users of the system with access to trade and travel opportunities. For the most part, this has been accomplished through the development of the Interstate, Primary, Secondary and Urban systems and other programs that foster highway safety, bridge improvements, and research and development.

In reviewing these achievements, we asked the question, "Is the system functional?" Congress envisioned that the Interstate System would be completed in 1991, and anticipated no further funding for additional construction beyond that year. Yet studies by both private and governmental agencies show that segments of the Interstate and Primary Systems have reached the end of their design life and must be replaced. Urban congestion, deteriorating and inadequate bridges, and the need for additional capacity in both urban and rural areas warrant continued federal support of our nation's highway and bridge network.

We also asked the question, "Is the system adequate?" Additional capacity for the Interstate System is well-grounded in statistics showing a projected increase in vehicle mileage

of at least 20 percent over the next decade. Incorporating portions of the Primary System into the Interstate system, in order to better serve rural and suburban areas, requires that roads be brought up to Interstate standards. Urban congestion is a nightmare.

Construction of new urban highways may be the only practical solution to this congestion because of difficulties in determining alternative strategies to reduce it. In examining the rural system, we find that the farmer needs increased highway planning and investment in order to share in America's economic growth.

Making the system functional and making the system adequate will require a guaranteed source of funding such as that provided by the Highway Trust Fund to do the job. Moreover, we can no longer tolerate the threat to public safety created by substandard roads and bridges.

We believe this account in the Highway Trust Fund should be drawn down to the extent permitted by law to meet demonstrated needs and protect public safety. Although this will not take the place of additional revenue needs, it would be an important first step in ensuring that these improvements will be made. Unfortunately, there is currently an unexpended $10.248 billion balance of dedicated user fees in the highway account of the Highway Trust Fund being held hostage. This continuing buildup is difficult to justify given that AASHTO recently recommended that a minimum $18 billion to $26 billion in annual funding level should be authorized over the life of the next highway bill.

Unrelated Economic Constraints Should Be Abolished

The maintenance and completion of our nation's highway infrastructure should remain a top priority. Yet, highway construction is held hostage by highly charged political issues such as air quality, speed limits and minimum drinking age that have no logical link to the Federal-aid Highway Program. Rather than tying unrelated economic sanctions to highway

construction, infrastructure should be treated as a central necessity to our economic survival. Moreover, artificial limits on spending authority should not impede authorized program levels.

Finally, we believe the current six-cent-per-gallon federal excise tax exemption for "gasohol" fuels should be eliminated. According to the Federal Highway Administration, this tax exemption costs the Highway Trust Fund more than $500 million annually, even though vehicles powered by alternative fuels inflict the same damage on roadways as vehicles using gasoline. In light of legislative proposals that would mandate the use of alternative fuels in certain areas, it is essential that this tax subsidy be repealed now in order to avoid a further drain on infrastructure funding.

Optimizing The Use Of Highway User Fees

The application of least cost (life cycle) analysis to highway projects has increased dramatically in the last five years. Local and state governments have increasingly included some type of analysis in their material selection process.

The importance of considering the future of a facility during the design and construction phase has been made clear by the multitude of problems many agencies are facing as our infrastructure wears out. In many instances, engineers and local officials are having to repair and replace integral sections of infrastructure that have experienced premature deterioration.

The transition from making decisions based on the first cost of a project to a more complex award process that involves prediction of interest and inflation rates for years into the future requires a major adjustment in philosophy of an awarding agency.

In fact, in September 1986, Chapter III of the NCPWI report entitled The Nation's Public Works: Defining The Issues promoted life cycle management techniques. Also the

Transportation Research Board, in its special study of innovative practices, has endorsed the concepts of life cycle cost analysis.

Innovative Technology

The use of innovative technology in the design and construction of public facilities should be fully examined by FHWA as a means to improve and extend the life of our system of highways. We might add that innovations can be found in vehicle configuration that makes them more suitable for the highways as well as in materials and construction techniques. We have heard of such developments as "smart" cars and traffic management systems that may affect our future highway transportation systems and also of exotic materials that will alter the way our road systems are constructed.

Mr. Chairman, we not only need to provide increased levels of funding for the highway program, but we must also make sure that we provide the traveling public and transporters of goods the most efficient and durable roads and bridges that existing technology can provide. In specific terms, we need to make sure that appropriate incentives are incorporated into the next highway bill so as to promote more innovation in design, new or better materials and research.

In summary, the maintenance and expansion of a healthy surface transportation system sustains and produces new jobs throughout the country. Your debate and final decision about our transportation network is critical to the future of our entire U.S. economy.

On behalf of the CIMSSC membership, I wish to thank you for this opportunity to present our views. I will be glad to answer any questions that the members of this Subcommittee may have.

Executive Summary

- America's competitive edge is being eroded because of the deterioration of our transportation systems. It is essential to make a commitment for adequate investment in highways and bridges in order to keep the U.S. economy on track.

- As economists have pointed out, our public infrastructure represents America's "third deficit." The longer that needed improvements are postponed, the more costly it will be in the long run.

- The mounting capital improvements necessary to sustain our surface transportation system are well-documented in reports by the Federal Highway Administration, the National Council on Public Works Improvement, the American Association of State Highway and Transportation Officials and other prestigious groups. Forty-two percent of America's bridges are classified as deficient or obsolete, while 60 percent of our roads are rated substandard. We endorse AASHTO's recommendation that the annual federal highway program funding level be gradually increased to $18 billion and $26 billion over the life of the next highway bill.

- The enormous, $10.248 billion cash balance in the Highway Trust Fund's highway account should be drawn down, with the collected user-fees spent for their intended purpose: highway and bridge improvements and construction.

- Unrelated economic constraints -- highway funding sanctions, the six-cent-per-gallon gasohol exemption, and artificial spending caps on highway program authorizations -- should be abolished.

- Optimum use of highway user fees should be emphasized, such as the application of life cycle cost analysis, which has been endorsed by groups including the NCPWI and the Transportation Research Board.

SUMMARY STATEMENT OF THE AMERICAN FARM BUREAU FEDERATION
THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
TO THE U.S. HOUSE OF REPRESENTATIVES
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
REGARDING REAUTHORIZATION OF THE POST-INTERSTATE SURFACE
TRANSPORTATION PROGRAM

Presented by George L. Berg, Jr.
Assistant Director, National Affairs Division
American Farm Bureau Federation

My name is George Berg and I am an Assistant Director of the National Affairs Division of the American Farm Bureau Federation. Farm Bureau is the world's largest farm organization representing over 3.8 million member families throughout 50 states and Puerto Rico. We appreciate the opportunity to present our views on surface transportation programs which will be expiring at the end of fiscal year 1991.

In my full statement to the Committee, I have listed a number of highway transportation policies which were approved by our voting delegates at our annual meeting this past January. One of the policy positions I mentioned states that for the purpose of maintaining primary and secondary roads, we support allowing more flexibility in the use of federal highway construction funds at the state level when a state has completed 90 percent of its Interstate highway system responsibility. Hopefully, this would earmark more funds that are desperately needed for the secondary highway and bridge program.

The secondary road system is in the poorest condition of all federal-aid highway systems. Given its extent (401,000 miles) and its relatively high usage, it is not surprising that the secondary system has been unable to keep abreast of the other systems, particularly when other more heavily used roads are competing for scarce funds. According to the Federal Highway Administration, almost 40 percent of the secondary paved mileage either requires, or will shortly require, major capital improvements.

The agriculture industry depends on local road and bridge transportation. All highway studies have acknowledged the poor condition of local roads and bridges, but they have usually failed to recognize their economic importance to every citizen in the state. They are essential to agriculture, forestry, rural tourism, rural industries, rural living, essential services and general state economic development. Rural roads and bridges are indeed, a vital link to agricultural prosperity.

The supplies and equipment that our farmers use in producing their crops are all hauled by truck or by rail to the rural locations where they are used. After the crops are harvested, all modes of transportation (truck, railroad, barge and ocean vessel) are utilized to move the commodities to the people who want and need them. Modern agriculture also requires the use of heavy equipment and machinery which must travel on rural roads and bridges. Other industries have similar needs, but in agriculture any disruption of the transportation system is more certainly reflected in the prices that our farmers receive for their commodities.

Farmers also recognize that we have a substantial bridge problem in the United States. Bridges help maintain the vital transportation services that are necessary for agriculture and rural development. Bridges allow vehicles to move with ease across this country. They allow cities to function and make truck transportation feasible. They permit farmers to move modern equipment to their fields and transport their products from the field to the marketplace.

We in agriculture are proud of the fact that we have the most productive and most efficient system of agricultural production to be found anywhere. We are reminded, however, that all of that production on our farms and ranches is of little value if we are unable to move it to market in a timely, economical and efficient manner. Agriculture is unique from many other industries due to its low density population, geographic features and highway patterns. The sudden loss of a bridge on a primary or secondary road would have a serious impact on farm economy and rural communities in general. A section of highway can be poor but still serviceable, the loss of a bridge can cause long-term disruption to the transportation of agricultural commodities. This is why we believe that providing adequate highways and bridge facilities is a proper role of government at all levels.

In summary, Mr. Chairman, we hope that the reauthorization of the post interstate surface transportation program will recognize that millions of Americans living on farms, ranches and in rural communities must have access to major highways. Rural roads are essential to the safe, efficient and economical transportation of food products from farms and ranches to consumers everywhere. In view of the fact that the interstate highway system is nearing completion and the secondary road system has been neglected for many years, we believe it's time Congress recognized the importance of these farm-to-market roads and bridges and authorize a realistic increase in this category of roads. In reauthorizing funds for the rural secondary highway system, Farm Bureau recommends $4 billion annually.

The basic dilemma that confronts the bridge situation is how to replace or rehabilitate as many bridges as possible with the limited funds available. The General Accounting Office found that costs to replace a given bridge can vary by thousands of dollars, depending on which state the bridge is in, who is paying for its replacement and who makes the decisions on its design and construction. Some of these cost differences are due to varying climate, terrain and methodology. Different policies at the local, state and federal levels are also major factors. In rural American, we feel that the timber bridge program promoted by the USDA office of Transportation provides an effective low-cost method of replacing many rural bridges. Because bridges are vital to all road systems, Farm Bureau recommends $4 billion annually, which we also believe is realistic.

Again, we thank you and the members of the Subcommittee for the opportunity to present our views on the reauthorization of the Federal-aid Highway Program.

STATEMENT OF THE AMERICAN FARM BUREAU FEDERATION
THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
TO THE U.S. HOUSE OF REPRESENTATIVES
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
REGARDING REAUTHORIZATION OF THE POST-INTERSTATE SURFACE
TRANSPORTATION PROGRAM

Presentec by George Berg, Jr.
Assistant Director, National Affairs Division
American Farm Bureau Federation

March 15, 1990

Thank you, Mr. Chairman. My name is George Berg, and I am an Assistant Director of the National Affairs Division of the American Farm Bureau Federation. Farm Bureau is the world's largest farm organization representing over 3.8 million member families throughout 50 states and Puerto Rico. We appreciate the opportunity to present our views on surface transportation programs which will be expiring at the end of fiscal year 1991.

The highway and transportation policy approved by our voting delegates at our annual meeting this past January made the following recommendations in regard to surface transportation programs:

Farm Bureau supports the development of a sound, long-range national transportation policy encompassing all modes of transportation to guide the development of the most economical and energy-efficient methods of meeting the transportation needs of the future.

The Federal Highway Trust Fund should be maintained as now constituted and no diversion of these highway funds to non-highway-related purposes should be permitted. We oppose increasing highway fuel taxes for deficit reduction purposes. We also favor removing the Highway Trust Fund from the unified federal budget.

Farm Bureau supports funding for the so-called 4-R Act (resurfacing, rehabilitation, repair and reconstruction) dealing with interstate highways since many of these highways have passed their design life span. We also oppose toll road construction where federal funds are involved.

We oppose action by Congress or the Department of Transportation to impose sanctions or to withhold user taxes or any other federal funds from any state in an attempt to force or coerce states to enact particular laws.

We support a comprehensive highway safety program to reduce traffic fatalities, injuries and the destruction of property.

Finally, Mr. Chairman, our policy states that for the purpose of maintaining primary and secondary roads, we support allowing more flexibility in the use of federal highway construction funds at the state level when a state has completed 90 percent of its interstate highway system responsibility.

In speaking of the rural secondary highway system, I am sure it is not necessary for me to remind the Members of this distinguished-Subcommittee that the secondary road system is in the poorest condition of all federal-aid highway systems. Given its extent (401,000 miles) and its relatively high usage, it is not surprising that the secondary system has been unable to keep abreast of the other systems, particularly when other more heavily used roads compete for scarce funds. According to the Federal Highway Administration, almost 40 percent of the secondary paved mileage either requires, or will shortly require, major capital improvements.

Rural roads and bridge maintenance and improvements have not kept pace with the rapidly increasing needs of agriculture. Most were constructed before 1940 and cannot handle the increased weights and widths of today's machinery, trucks, school buses, fire equipment, etc.

The agricultural industry depends on local road and bridge transportation. All highway studies have acknowledged the poor condition of local roads and bridges, but they have usually failed to recognize their economic importance to every citizen in the state. They are essential to agriculture, forestry, rural tourism, rural industries, rural living, essential services and general state economic development. Rural roads and bridges are indeed, a vital link to agricultural prosperity.

The supplies and equipment that our farmers use in producing their crops are all hauled by truck or by rail to the rural locations where they are used. After the crops are harvested, all modes of transportation (truck, railroad, barge and ocean vessel) are utilized to move the commodities to the people who want and need them. Modern agriculture also requires the use of heavy equipment and machinery which must travel on rural roads and bridges.

Other industries have similar needs, but in agriculture any disruption of the transportation system is most certainly reflected in the prices that our farmers receive for their commodities. Agricultural producers are subject to a number of

hazards, such as floods, storms, hail and drought. Therefore, deterioration of our rural roads and bridges is a major concern to our farmers and ranchers because they are critical to the efficient and dependable transportation of agricultural products.

Farmers also recognize that we have a substantial bridge problem in the United States. Bridges help maintain the vital transportation services that are necessary for agriculture and rural development. Bridges allow vehicles to move with ease across this country. They allow cities to function and make truck transportation feasible. They permit farmers to move modern equipment to their fields and transport their products from the field to the marketplace.

We in agriculture are proud of the fact that we have the most productive and most efficient system of agricultural production to be found anywhere. We are reminded, however, that all of that production on our farms and ranches is of little value if we are unable to move it to market in a timely, economical and efficient manner. Agriculture is unique from many other industries due to its low density population, geographic features and highway patterns. The sudden loss of a bridge on a primary or secondary road would have a serious impact on farm economy and rural communities in general. A section of highway can be poor but still serviceable, the loss of a bridge can cause long-term disruption to the transportation of agricultural commodities. This is why we believe that providing adequate highways and bridge facilities is a proper role of government at all levels.

In summary, Mr. Chairman, we hope that the reauthorization of the post interstate surface transportation program will recognize that millions of Americans living on farms, ranches and in rural communities must have access to major highways. Rural roads are essential to the safe, efficient and economical transportation of food products from farms and ranches to consumers everywhere. In view of the fact that the interstate highway system is nearing completion and the secondary road system has been neglected for many years, we believe it's time Congress recognized the importance of these farm-to-market roads and bridges and authorize a realistic increase in this category of roads. In reauthorizaing funds for the rural secondary highway system, Farm Bureau recommends $4 billion annually.

The basic dilemma that confronts the bridge situation is how to replace or rehabilitate as many bridges as possible with the limited funds available. The General Accounting Office found that costs to replace a given bridge can vary by thousands of dollars, depending on which state the bridge is in, who is paying

for its replacement and who makes the decisions on its design and construction. Some of these cost differences are due to varying climate, terrain and methodology. Different policies at the local, state and federal levels are also major factors. In rural American, we feel that the timber bridge program promoted by the USDA office of Transportation provides an effective low-cost method of replacing many rural bridges. Because bridges are vital to all road systems, Farm Bureau recommends $4 billion annually, which we also believe is realistic.

Again, we thank you and the members of the Subcommittee for the opportunity to present our views on the reauthorization of the Federal-aid Highway Program.

STATEMENT OF WILLIAM H. DEMPSEY

PRESIDENT OF THE ASSOCIATION OF AMERICAN RAILROADS

BEFORE THE

SURFACE TRANSPORTATION SUBCOMMITTEE

OF THE

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

SURFACE TRANSPORTATION REAUTHORIZATION

MARCH 15, 1990

38-253 O—91——25

I. INTRODUCTION

My name is William H. Dempsey. I am the President of the Association of American Railroads. The AAR is the national trade association of the freight railroad industry. It represents Class I railroads that accounted for 93 percent of rail revenues and 90 percent of rail employees in 1989.

I welcome this opportunity to present the railroad industry's view on the 1991 highway reauthorization legislation.

The freight railroad industry's single, most pressing concern with the 1991 highway bill is the possibility that it will end up raising the current federal 80,000 pound weight limit.

Increased weight limits are literally a matter of life or death for the railroad industry. A higher weight limit would open the way to nationwide operation of longer combination vehicles (LCVs). Among the monster combinations possible with a higher weight limit would be twin 48s and triple 28s.

AAR estimates show that nationwide operation of Bridge Formula B (BFB) twin 48-foot combinations with a maximum gross weight of 135,000 pounds would result in railroad losses of 9 percent of annual ton-miles and 52 percent of net operating revenue (rail pre-tax profits), based on 1986 figures, the most recent available.

And those are just the first order effects. As railroad profits fell, rail management would be forced to cut service and abandon lines. In the long run, this would mean a far smaller rail system than today.

II. THE AMERICAN PUBLIC SHARES THE RAILROAD INDUSTRY'S OPPOSITION TO LONGER, HEAVIER TRUCKS.

According to a January 1990 poll of 1,000 Americans conducted by Frederick/Schneiders for the AAR, ninety percent of those surveyed want to see truck lengths kept the same or made shorter. Only six percent wanted to see longer trucks (Exhibit I).

- And when asked about particular combinations (Exhibit II):

  * *92 percent were against triple 28 combinations; and*
  * *82 percent were against twin 48s.*

Moreover, this opposition was virtually constant by region of the country, urban or rural residence, age, and gender.

The public is particularly concerned about the safety effects of longer trucks. By a margin of 86 to 12 percent, they believe that longer trucks would be less safe than trucks on the road today; seventy-five percent believe that they would make driving harder (Exhibit III).

III. THE FEDERAL HIGHWAY ADMINISTRATION'S MOST RECENT STUDY OF LCVs SUPPORTS PUBLIC CONCERNS OVER LCV SAFETY.

The FHWA's 1985 study of a proposed national system of LCV operations cited unresolved concerns with transportation system investment, modal diversion, and vehicle safety as reasons why no such system was justified.

On LCV safety the study found that: "Performance and handling limitations of LCVs, as well as their higher gross weights, could prove to create significant safety problems if LCVs are used more generally..." (at p. S-5) or, stated more baldly, "We simply do not know whether LCVs can be operated safely in general use." (at p. S-6.)

IV. FHWA FOUND EQUALLY SERIOUS ECONOMIC POLICY PROBLEMS RAISED BY LCVS.

On highway investment the study determined that: "The need to upgrade highway infrastructure and roadway geometry and to build staging areas would require large investments prior to fee collection from LCV users. There is no clear evidence that such investment is the most productive potential use of limited transportation funds." (At p. VIII-1, emphasis added.)

On the heavy truck subsidy: "Extending operation of LCVs would substantially increase highway investment costs. Since LCVs would not come close to paying their share of highway costs under current user fees, extending their operation without a substantial increase in user fees would unfairly subsidize them at the expense of other highway users and other freight transportation modes." (At p. S-9.)

And on rail diversion: "When the nation's transportation system is considered as a total entity, diversion from rail would reduce the total transportation productivity and fuel consumption gains made by LCVs," and "Diversion would result in the need to spread fixed costs over a smaller traffic base, potentially resulting in higher rates from some shippers." (Both at p. S-7.)

In fact, when FHWA compared LCVs overall to conventional semi-trailers on eleven key safety, handling, and efficiency criteria:

Twin 48s were much worse than current trucks on five criteria; the same on three; and superior on only three.

Triples did even more poorly: they were much worse than single 48s on six criteria, somewhat worse on one, the same on two, and better on only two.

Nothing has changed since 1985 to make FHWA's conclusions less true. If anything, the increasing congestion and deterioration of

the nation's highways make longer and heavier trucks an even worse idea today than they were five years ago.

It is not surprising, therefore, that the National Transportation Policy Review (NTPR), released last week by Secretary Skinner, made substantially the same points on truck size and weight policy as FHWA's 1985 report.

According to the Policy Review, "maximum truck size and weight limits should be based on a full assessment of the public costs and benefits". (NTPR at p. 76, emphasis added.) The Policy Review notes explicitly that among the potential costs are external social costs, like pollution and safety. (NTPR at p. 76.)

And the Policy Review reiterates FHWA's position that a change in limits must mean an adjustment in user charges. (NTPR at p. 76.) All past FHWA work has suggested that such an adjustment would be massive, given the size of the heavy truck underpayment.

V. BOTH FHWA'S WORK AND PUBLIC PREFERENCES CORRESPOND TO OUR VIEW OF RAIL'S ROLE IN MEETING THE TRANSPORTATION CHALLENGE OF THE COMING DECADES.

The Frederick/Schneiders poll found that Americans preferred--by a 78 to 22 percent margin--that increases in long-haul freight traffic be carried by rail, not truck.

The public recognizes that, to a considerable degree, the challenges facing freight transportation are the product of the conflict between increasing volumes of heavy truck traffic and rising "quality of life" expectations.

A. For Example, The Rapid Growth In Truck Traffic Is Imposing Increasing Costs On The Passenger Transportation System.

Although these costs do not show up in the government's budget, they are nonetheless real and important. They include:

1. Billions of dollars a year in increased operating costs paid by automobile drivers as a result of highway pavement deterioration caused by heavy trucks; and

2. Increased congestion costs primarily, but no longer exclusively, in urban areas (Exhibit IV).

Fortunately, to a much greater degree than trucking, rail transportation is insulated from automobile operations. So railroads, as an alternative to continued rapid growth in truck traffic, represent an option that could ease the growing problems experienced by the average automobile driver.

B. Increased Reliance On Environmentally Superior Rail Transportation Could Also Alleviate The Growing Environmental Problem Generated By Rapidly Rising Levels Of Truck Traffic.

For example:

1. Railroads produce far less air pollution than trucks per ton-mile of freight moved, and the relatively self-contained nature of rail facilities tends to lessen other pollution problems (Exhibit V).

2. Compared to truck, railroads are nearly three times more fuel efficient (Exhibit VI).

C. Finally, The Growth In Truck Traffic Volume Is Putting Increased Stress On Highway Infrastructure.

Government studies show that for a typical rail-competitive heavy truck, user charge levels cover only about half of direct highway cost responsibility.

Consequently, for the highway system, heavy trucks represent a net financial loss that burdens federal and state efforts to make needed improvements in highway system quality.

Rail operations, on the other hand, do not impose net financial losses on public infrastructure systems.

On the contrary, rails build and maintain their own infrastructure and even pay property taxes on it. Diverting traffic from truck to railroads would improve the financial status of the national transportation infrastructure.

Achieving these benefits requires a healthy and dynamic railroad system. Allowing subsidized longer and heavier trucks would end any possibility of rail helping meet the nation's transportation goals. Unfortunately, nothing suggests that the heavy truck subsidy is about to end.

VI. IN FACT, THE FEDERAL HEAVY TRUCK SUBSIDY IS LARGER NOW THAN IT WAS WHEN THE LAST HIGHWAY TAX LEGISLATION WAS PASSED.

A. The Average Heavy Truck Combination Paid About 66 Percent Of Its Direct Costs After Passage Of The 1984 Deficit Reduction Act, According To FHWA's 513(g) Study Of Alternatives To The Heavy Vehicle Use Tax.

Rail-competitive heavy trucks, which do more annual miles and hence cause more road damage than the average heavy truck, paid only about 55 percent, according to an AAR extension of the 513(g) results.

B. But Inflation, Fuel Economy Gains, And Increased Annual Mileage Have Eroded The Value Of Heavy Truck Tax Payments Since The Middle Of The Decade.

Take the federal fuel tax, by far the most important federal highway user charge. In 1984 the average rail-competitive heavy combination paid 2.8 cents per mile in federal fuel tax. By 1989, inflation had reduced the effective rate to 2.5 cents in real 1984 dollars. A 5.6 percent gain in fuel economy meant a further reduction to 2.3 cents. So, overall, the tax paid per mile had fallen 17.9 percent in four years (Exhibit VII).

C. Nor Can The Underpayment Problem Ever Be Solved By Raising The Fuel Tax--Even If It Could Be Adjusted For Inflation And Fuel Economy Gains.

Fuel taxes cannot account for heavy truck cost responsibility. The reason is simple. Cost responsibility increases exponentially with weight. Fuel consumption goes up only very slowly as vehicle weight rises. A twin 48 combination consumes only 36 percent more fuel than an 80,000 pound tractor semi-trailer but does 93 percent more highway damage based on an AAR analysis using ESALS, the standard pavement engineering measure of road damage.

D. The Only Solution To The Underpayment Problem--And Even It Is Not Perfect--Is To Impose A Tax Designed To Track Cost Responsibility.

The most practical such tax is a weight-distance tax. A 1988 FHWA study found that a federal weight-distance tax was perfectly feasible at administrative costs a little over 1 percent of total collections.

But trucking industry opposition to a weight-distance tax remains fierce, and the likelihood that one would ever be imposed at full cost recovery levels is remote in the extreme.

VII. IT SEEMS QUITE CLEAR, THEREFORE, THAT RAILROADS WILL FACE HEAVILY SUBSIDIZED TRUCKING INDUSTRY COMPETITION FOR THE INDEFINITE FUTURE.

And, as the FHWA study recognized in 1985, LCVs will be at least as subsidized as existing combinations.

A continuing heavy truck subsidy means that a substantial portion of the traffic diverted from rail as a result of heavy truck competition will be inefficient. It will cost society more in highway system and other "external" social costs than it pays in user charges. Adding this money losing traffic to the

highway system will accelerate pavement deterioration. If repairs fail to keep pace because of the heavy truck underpayment, the costs of other highway users will rise sharply. These costs could well be much larger than the underpayment itself because user costs (such as vehicle repair and maintenance) rise steeply as pavement deteriorates.

Highway agencies may also be forced to divert scarce funds to repair truck damaged roads. Foregoing needed expenditures on crowded urban interstates for even a year or two could have huge additional costs.

External social costs--congestion, noise, and pollution--could rise, too, as rail freight is diverted.

And finally, remaining rail shippers will face higher costs as rail service quality declines and--perhaps--rates increase to cover rail fixed costs.

VIII. THESE ENORMOUS POTENTIAL COSTS DEMONSTRATE THE DANGERS OF MODALLY COMPARTMENTALIZED DECISION MAKING.

Government highway policies such as truck size and weight limits profoundly affect railroads. The impact of the resultant rail to truck traffic diversion can produce some very large

unintended consequences on automobile repair costs, congestion, highway finance, pollution and energy consumption. Conversely, truck to rail traffic diversion may offer important benefits for our crowded, deteriorating highway system. Or, as we would put it, highway policy is rail policy.

MASTER QUESTIONNAIRE

TABULAR REPORT

I.
OVERVIEW

The American public strongly rejects the idea of increased truck lengths. Only 6% support the concept of longer trucks while more than four-in-five Americans oppose specific policy options of twin-48 foot vehicles and triple-28 foot vehicles.

The biggest concern Americans have with such longer trucks is safety; by 86% to 12%, poll respondents say these proposed combination vehicles would be less safe than trucks currently on the road today.

Strong opposition to longer trucks is consistent across all regions of the country as well as in rural and urban areas.

Poll results reported in this analysis are based on a random telephone survey of 1,000 adult Americans nationwide conducted between January 23 and February 1, 1990. The margin of error is plus or minus 3% at the 95% confidence level. This survey was conducted by Frederick/Schneiders for the Association of American Railroads.

II.
OPINION OF TRUCK LENGTH CONCEPT

As an introduction to the policy of truck lengths, poll respondents were asked which of three policy options they prefer: to change the law to require trucks to be shorter; to change the law to allow longer trucks; or to keep the law as it is today.

The sizeable majority (72%) opt for the status quo; keep the truck length law as it is today. **Only 6% support allowing longer truck lengths.** In fact, the constituency for reducing truck length is three times greater than for increasing their length.

OPINION ON TRUCK LENGTH CONCEPT

In general, which do you think would be the best policy regarding the length of trucks?

- **Change the law to require trucks be shorter.**
- **Change the law to allow longer trucks.**

  —OR—
- **Keep the law on truck length as is.**

Opinion against longer trucks is consistent across all regions of the country.

OPINION ON TRUCK LENGTH CONCEPT
BY REGION

	NATION WIDE %	NORTH EAST %	SOUTH %	MID-WEST %	WEST %
Keep length as is.	72	71	74	72	69
Require trucks to be shorter.	18	19	15	19	21
Allow longer trucks.	6	6	6	5	6
Don't Know	4	4	4	4	5

Additionally, little difference in opinion occurs based on population density of where respondent lives. Support for "longer trucks" ranges from a low of 4% among suburban dwellers to a "high" of 7% among urban and rural residents. The status quo is supported by more than two-thirds regardless of whether they live in urban, rural, suburban, or small town areas.

III.
OPINIONS ON SPECIFIC PROPOSED LONGER TRUCK COMBINATIONS

Americans strongly reject the idea of allowing either twin-48 foot combinations or triple-28 foot combinations on America's roads. Twin-48's are rejected by more than four out of five respondents while triple-28's are rejected by more than nine-in-ten. In fact, more than two-thirds are strongly opposed to either proposed combination.

OPINION ON SPECIFIC TRUCK LENGTH PROPOSALS -- TWIN 48'S AND TRIPLE 28'S

The typical truck now on the road is a single 48-foot trailer pulled by a tractor. Some people favor allowing one tractor to pull a second 48-foot trailer behind the first. Do you favor or oppose this proposal to allow combinations of two 48-foot truck trailers on America's roads?

	TWIN 48'S %
Strongly favor	5
Somewhat favor	9
Somewhat oppose	17
Strongly oppose	65
Don't Know	4
NET FAVOR	14
NET OPPOSE	82

The typical double truck now has two 28-foot trailers behind a single tractor. Some people favor allowing one tractor to pull a third 28-foot trailer behind the first two. Do you favor or oppose this proposal to allow combinations of three 28-foot long trailers on America's roads?

	TRIPLE 28'S %
Strongly favor	2
Somewhat favor	3
Somewhat oppose	12
Strongly oppose	80
Don't Know	3
NET FAVOR	5
NET OPPOSE	92

As the following table shows, the overwhelming opposition to either proposed combination is consistent across all regions of the country and in all types of areas regardless of population density.

OPINION ON SPECIFIC TRUCK LENGTH PROPOSALS:
BY KEY SUBGROUPS

	--TWIN-48's--			--TRIPLE-28's--		
	FAVOR %	OPPOSE %	STRONG OPPOSE %	FAVOR %	OPPOSE %	STRONG OPPOSE %

65+	7	88	(74)	4	94	(84)
Gender						
Men	19	78	(61)	7	92	(79)
Women	9	86	(69)	4	94	(82)

IV.
OPINION OF LONGER TRUCK COMBINATIONS WITH A CONDITIONAL ROLE

Even under highly restricted conditional terms, a clear majority of Americans reject the proposed longer combination trucks. By 61% to 36%, poll respondents oppose legalizing longer combination trucks even if their access were limited only to the interstate system in a long-haul carrier role.

OPINION OF LONGER TRUCKS WITH CONDITIONAL TERMS

If supporters of longer trucks agreed to only operate them as long haul carriers on the interstate system but not on city streets, would you favor or oppose allowing these longer combination trucks?

Again, opinions against longer trucks are consistent across all regions of the country:

- Northeast 36% favor, 61% oppose
- South 34% favor, 62% oppose
- Midwest 36% favor, 61% oppose
- West 37% favor, 61% oppose

V.
REACTION TO ARGUMENT FOR AND AGAINST LONGER TRUCKS

Poll respondents were read a series of paired arguments in favor and against longer trucks. For each, **the majority sided with the anti-truck length side.**

Specifically,

- By 86% to 12%, Americans say longer trucks would be less safe than trucks on the road today.

- By 75% to 21%, Americans say sharing the road with longer trucks will make driving harder.

- By 74% to 20%, Americans say longer trucks will not reduce the volume of truck traffic.

- By 69% to 26%, Americans say such longer vehicles will cause more road damage than today's trucks.

- By 67% to 23%, Americans believe any savings from reduced shipping costs created by longer trucks will not be passed to consumers.

  --*and*--

- By 53% to 39%, Americans say truck drivers are not capable of safely handling longer trucks.

OPINION ON VARIOUS ARGUMENTS RELATED TO LONGER TRUCKS

VI.
MOOD BACKGROUND: TRUCKS VERSUS RAIL

By better than three-to-one, respondents express a clear preference for an increase of freight traffic on rail over trucks. The overwhelming preference for increased rail freight over increased truck freight is consistent across all regions of the state. Sympathy for truck freight reaches its highest level among rural residents; 28% of whom support trucks but 65% of whom prefer rail.

OPINION OF RAIL VERSUS TRUCK ON BEST CARRIER FOR INCREASED LOAD

As you may know, most freight shipped in America is carried by either truck or railroad. As the amount of freight to be moved long distance in this country increases, which of the following alternatives would be better for our society?

- **If most of the increase in freight traffic was handled by trucks.**

  --OR--

- **If most of the increase in freight traffic was handled by rail.**

This 72% to 22% preference to see increased freight on the rails, not the roads, is connected to a lukewarm rating of today's road and highway system. Opinions of the road and highway system are mixed; half rate it positive and half negative.

RATING OF THE CONDITION OF AMERICA'S ROAD AND HIGHWAY SYSTEM

Moreover, Americans do not see the condition of the roads getting much better. Just 29% say conditions are improving. The plurality see static conditions while 27% say it is getting worse.

In your opinion, is the condition of America's road and highway system better, worse, or about the same as it was five years ago?

VII.
MOOD BACKGROUND: POLITICAL ENVIRONMENT

Consistent with public polls conducted by Gallup and leading news organizations, this survey shows President George Bush with performance ratings much higher than those given Congress and a bare majority of Americans satisfied with the country's direction.

NATIONAL POLITICAL ENVIRONMENT

JOB RATING OF PRESIDENT BUSH	%	*JOB RATING OF U.S. CONGRESS*	%	*DIRECTION OF THE COUNTRY*	%
Positive	82	Positive	45	Right	53

Don't Know	44	4%

4. In general, how would you rate the condition of America's road and highway system -- excellent, good, not so good, or poor?

Excellent	46	5%
Good	464	46%
Not so good	307	31%
Poor	176	18%
Don't Know	9	1%

AAR NATIONAL SURVEY
Master Questionnaire

Actual sample: 1002

5. In your opinion, is the condition of America's road and highway system better, worse, or about the same as it was five years ago?

Better	286	29%
Worse	271	27%
About the same	421	42%
Don't Know	24	2%

6. As you may know, most freight shipped in America is carried either by truck or railroad. As the amount of freight to be moved long distance in this country increase, which of the following alternatives would be better for our society?

If most of the increase in freight traffic was handled by trucks.	222	22%
If most of the increase in freight traffic were handled by rail.	721	72%
Don't Know	59	6%

7. It has been suggested that Congress consider changing the length of trucks on America's roads today. In general, which do you think would be the best policy regarding the length of trucks?

Change the law to require trucks to be shorter.	183	18%
Change the law to allow longer trucks.	59	6%
Keep the law on truck lengths as is.	718	72%
Don't Know	42	4%

8. Let me give you some information about this subject and ask your opinion. The typical truck now on the road is a single 48-foot trailer pulled by a tractor. Some people favor allowing one tractor to pull a second 48-foot trailer behind the first. Do you favor or oppose this proposal to allow combinations of two 48-foot truck trailers on America's roads? (*IF CHOICE*) Do you strongly or only somewhat (*FAVOR/OPPOSE*) this idea?

Strongly favor	54	5%
Somewhat favor	88	9%
Somewhat oppose	169	17%
Strongly oppose	654	65%
Don't Know	37	4%

AAR NATIONAL SURVEY
Master Questionnaire

Actual sample: **1002**

9. The typical double truck trailer now has two 28-foot trailers behind a single tractor. Some people favor allowing one tractor to pull a third 28-foot trailer behind the first two. Do you favor or oppose this proposal to allow combinations of three 28-foot long trailers? (*IF CHOICE*) Do you strongly or only somewhat (*FAVOR/OPPOSE*) this idea?

Strongly favor	23	2%
Somewhat favor	34	3%
Somewhat oppose	125	12%
Strongly oppose	805	80%
Don't Know	15	1%

10. Which side do you agree with?

Supporters of longer trucks who say such longer trucks will be just as safe as those on the road today.	116	12%
Opponents of longer trucks who say such longer trucks would be less safe.	858	86%
Don't Know	28	3%

11. Which side do you agree with?

Opponents of longer trucks who say sharing the road with such vehicles will make driving harder.	747	75%
Supporters of longer trucks who say motorists will adjust to such vehicles just as they adjusted to sharing the road with today's double trailer vehicles when they were legalized.	211	21%
Don't Know	44	4%

AAR NATIONAL SURVEY
Master Questionnaire

Actual sample: 1002

12.	Which side do you agree with?		
	Supporters of longer trucks who say such vehicles will cause no more damage to the roads than today's trucks.	262	26%
	Opponents of longer trucks who say such vehicles will cause more road damage than today's trucks.	691	69%
	Don't Know	49	5%
13.	Which side do you agree with?		
	Opponents of longer trucks who say today's truck drivers are not capable of safety handling longer trucks.	532	53%
	Supporters of longer trucks who say only the most experienced, safest, and best-trained drivers will drive these longer trucks.	390	39%
	Don't Know	80	8%
14.	Which side do you agree with?		
	Supporters who say longer trucks will lower freight transportation costs, cutting prices for consumers.	235	23%
	Opponents who say any savings on shipping costs will not be passed on to the consumers.	668	67%
	Don't Know	99	10%

AAR NATIONAL SURVEY
Master Questionnaire

Actual sample: 1002

15. Which side do you agree with?

Supporters who say such longer trucks will mean fewer trucks on the road.	198	20%
Opponents who say allowing longer trucks will do nothing to reduce the volume of truck traffic.	742	74%
Don't Know	62	6%

16. If supporters of longer trucks agreed to only operate them as long haul carriers on the interstate system but not on city streets, would you favor or oppose allowing these longer combination trucks?

Favor	359	36%
Oppose	613	61%
Don't Know	30	3%

17. Sex.

Male	501	50%
Female	501	50%

VI. THE NEED FOR EXPANDED TRUCKING-RELATED RESEARCH & DEVELOPMENT

VII. THE NEED FOR A MOTOR CARRIER ADMINISTRATION

VIII. CONCLUSION

Chairman Mineta and members of the Subcommittee, my name is Thomas J. Donohue. I am president and chief executive officer of the American Trucking Associations, the national trade association of the trucking industry. ATA's membership includes more than 4100 carriers and suppliers of all sizes and types. ATA is a federation; membership in our 51 state associations and 10 conferences representing different industry segments, combined with ATA's direct membership, totals over 30,000.

I deeply appreciate this opportunity to present the trucking industry views on the nation's highway program - a program of critical importance to our industry. My remarks today will concentrate on six areas:

- The Future of the Highway Program
- The Productivity of the Trucking Industry
- The Cumulative Burden of State Taxes and Fees
- The Importance of Safety
- The Need for Expanded Trucking-Related Research & Development
- The Need for a Motor Carrier Administration

I. INTRODUCTION

Before I address these six major areas, I feel it is essential for me to outline the importance of the trucking industry to the well-being of the American economy. Let me try to illustrate the significance of this relationship:

- Over 77% of the Nation's freight, measured by value, moves on the Nation's highways, in commercial trucks.
- The trucking industry, as a whole, earns some $240 billion in annual gross freight revenues, and generates fully 5% of our gross national product.
- The trucking industry employs 7.5 million Americans, and pays them over $160 billion annually in wages.

Clearly, the Nation has a heavy stake in the productivity of the trucking industry, and our industry has a heavy stake in the adequacy of the Nation's roads. It has also become clear that without more money for transportation, the Nation's economy will suffer. In the fall of 1988, Dr. David A. Aschauer, Chicago Federal Reserve Bank, released results of his research in the several decades long decline in American productivity and the correlary decline in public infrastructure investment. Here are some of Dr. Aschauer's findings:

> "...Not only has productivity growth fallen over time, but it has tumbled relative to the experience of our major international competitors as well.
>
> "...there are deeper implications of the national neglect of our public facilities for the health of the United States economy. Indeed, I have uncovered striking evidence that the recent fall-off in public works spending is at the very core of the productivity slowdown.

"Productivity clipped along at a 2 percent rate during 1950 to 1970, while the net public stock expanded by 4.1 percent per year. However, after 1970 the rate of increase in the public capital stock fell to a mere 1.6 percent per year, bringing with it a slump in productivity growth to a miserly .8 percent annual rate.

"Thus, a root cause of the decline in the competitiveness of the United States in the international economy may be found in the low rate at which our country has chosen to add to its stock of highways, port facilities, airports and other facilities which aid in the production and distribution of goods and services...we as a country should be vitally concerned with the viability of our economic lifelines that enable us to meet the challenge of an increasingly competitive world marketplace."

While some critics have suggested that the correlation between highway investment and productivity is spurious, we believe that there are circumstances where a direct correlation can be demonstated. For this reason we feel that continued direct federal investment is essential.

A second important aspect of the trucking industry need for a strong, well developed system of national highways is a process called "just in time" scheduling of deliveries.

American industry has taken a page out of a chapter of the Japanese industrialists. In Japan, where there is not a lot of land to build warehouses, they schedule deliveries by computers. Deliveries are timed so that suppliers get their products to the assembly line within 2 or 3 hours of when the assembly line needs them. Consequently, the Japanese manufacturers do not have to build warehouses. What they do is store their raw materials and their component parts on the highway system in transit in trucks.

Secretary Skinner--in the just released National Transportation Policy--cited an example of similar delivery systems for United States auto manufacturers:

> ...every hour the new Chrysler assembly plant in Sterling Heights, Michigan, electronically notifies a supplier located 60 miles away, with an order for the seats the plant will need four hours later. The supplier assembles the seats to fill the order and they are delivered by truck within hours, to be installed in finished vehicles that same working day.

These programs have contributed significantly to the increased demand for truck transport. "Just in time" delivery and other innovations in truck transport have clearly had a major impact on the continuing steady growth of the United States manufacturing economy.

Consequently, if future traffic congestion around urban areas becomes so severe that truck deliveries cannot be made, what is going to happen? I do not think we should fool ourselves and say that American manufacturers are going to shift back to rails. What they are going to do is move out of the cities and locate in a place where they can continue to keep their trucks moving.

II. THE FUTURE OF THE HIGHWAY PROGRAM

Program Structure

In anticipation of the reauthorization of the federal-aid highway program, ATA has worked with other organizations such as the Highway Users Federation for Safety and Mobility (HUFSAM) and as part of the Transportation Alternatives Group (TAG) to develop a consensus of highway transportation groups. Those efforts produced consensus of many hundreds of highway user groups on a nine point program by the HUFSAM. The nine points of the consensus are:

- Protect the Interstate System
- Create a National Arterial System
- Restore Metropolitan Mobility
- Connect Rural America
- Keep all Bridges Safe
- Improve Traffic Safety
- Focus on Research
- Develop Scenic/Recreational Roads
- Assure Better Planning

The TAG reached consensus on 10 broad principles which should guide the new highway program. A brief summary of the TAG policy themes is:

TRANSPORTATION ALTERNATIVES GROUP, BASIC DIRECTIONS

Policy Themes

- Maintain the physical integrity of existing transportation systems

- Increase productivity, efficiency, market-responsiveness, and international competitiveness

- Provide increased capacity in congested and developing areas and improved rural access

- Enhance safety of all transportation modes
- Reduce barriers to intermodal, interagency and public/private cooperation
- Develop strategies to reduce environmental and resource impacts
- Simplify and focus federal-aid programs
- Improve metropolitan and rural regional planning/programming
- Encourage the best available technology
- Commit to needed investment level increases

To achieve these goals, ATA believes that the preservation, expansion, and reconstruction of the National System of Interstate and Defense Highways and major Primary highways of national concern should be the cornerstone of a new federal highway program.

All of the many organizations involved in surface transportation unanimously supported the continuation of a strong and expanded federal highway program to meet the mobility needs of our nation. To meet pressing infrastructure needs and to develop a new system of Highways of National Significance increased federal highway funding is clearly needed. The new national system should consist of 140,000 to 160,000 miles which will effectively connect all of the nation's population centers. It should include the Interstate System and major primary or other arterial routes necessary to develop a national network. The Federal Government should continue to assume primary responsibility for financing, construction, and reconstruction of the new National System.

Highways Of National Significance

Full federal-aid funding, as now authorized, should be provided through FY 1991. After completion of the Interstate System, the Highways of National Significance must become the principal federal aid system. This system should be funded at a level to meet essential future needs and at a higher federal aid matching ratio than any other federal aid highways.

The Highways of National Significance should be designated in its entirety for vehicles of the weight and length authorized by the Surface Transportation Assistance Act of 1982 (STAA) and for any longer combinations or trailer lengths subsequently endorsed by studies mandated by the Congress such as the Transportation Research Board Truck Weight Study.

Primary or arterial routes which are incorporated into the Highways of National Significance should be upgraded to standards adequate for the traffic volumes and vehicle populations using such routes on a priority basis. These routes which will carry more than 70 percent of the nation's intercity freight will require increased funding to meet these higher highway standards. Some may need to be upgraded to near Interstate System standards but many may simply need to be rehabilitated to provide for modern geometrics and adequate traffic movement. Relieving congestion in urban areas on these primary or arterial connectors should also be a priority for the Highways of National Significance. This may be accomplished by

traffic control measures, adding lanes or other geometric changes. The objective must be to provide mobility for all intercity traffic as efficiently as possible. Fund distribution to the new system should be by formula.

Bridges, Secondary And Urban Roads

Federal aid should continue for major bridges and for secondary and urban roads off the National System to improve urban, suburban and rural mobility. Many interstate freight movements begin or end on lesser rural and urban primary and secondary routes and federal aid programs are needed for major construction projects on these routes.

Accordingly, a significant federal aid program for routes not included on the new National system will remain a high priority for the trucking industry. Increased federal highway spending should be sought for these categories through 1995 either by reducing specific categories or by block grant programs with some restrictions on use.

Strategies For Enhancing Productivity

There are several strategies for enhancing the productivity and efficiency of the physical highway infrastructure that we would support. These include building stronger and thicker pavement structures with better draining base courses on major highways; instituting pavement and bridge management systems on a broader set of highways aimed at minimizing life cycle pavement, bridge and highway user costs; and implementing

transportation systems management programs in urban areas featuring the best available technologies to support traffic operations, surveillance and control, and enhanced incident management.

Cost Effective Pavement Design

A recent study conducted for our affiliate, the Trucking Research Institute (TRI), reanalyzed data from the American Association of State Highway Officials (AASHO) Road Test, collected from an experiment conducted in 1958-1960 which provides the basis for pavement design practices in the U.S. today. The TRI study observed large differences in the performance of equivalent pavement sections placed under identical traffic loads at the Road Test--performance variations that often exceeded a factor of ten.

Since wheel loads, tire pressures and vehicle operating speeds were carefully controlled at the Road Test, we can only conclude that the erratic performance of pavements at the Road Test is the result of some unexplained differences in pavement strength, construction, materials or other conditions that existed at the Road Test site. These irregular results, in our opinion, only reinforce the need for improved pavement designs for long-range durability.

Federal support for pavement research through the Strategic Highway Research Program Long Term Pavement Performance Program and other research programs should be continued. Yet, as that research progresses, we strongly recommend that the Nation begin

building and rebuilding its major highways with stronger and thicker pavement structures and better draining base courses. This strategy will increase the probability that pavements will last their intended lives, dramatically reduce life cycle pavement and highway user costs, and make the transportation sector a more productive part of the economy.

A recent study by Kenneth A. Small, Clifford Winston and Carol A. Evans, Road Work, published by the Brookings Institution, observes that the trucking industry and the Nation are paying a steep price for suboptimally designed pavements and that "trucks would damage roads far less if roads were correctly built in the first place." In reaching this conclusion, the study assumes life cycle highway costs would be minimized through optimal highway design -- in their words, by adding "pavement thickness (or other measures to improve durability) until the incremental cost of additional durability equaled the incremental savings in maintenance and (highway) user costs." With these durability improvements, the study suggests heavy combination vehicles would pay 2/3 of their current road user charges.

The economies of scale of building stronger and thicker pavement structures are enormous. According to American Association of State Highway and Transportation Officials (AASHTO) design procedures, one additional inch of concrete pavement effectively doubles the strength (and life) of a pavement yet adds only 4% to pavement related construction costs

and less than 1/2 of 1% to the total construction costs of a rural Interstate highway (according to Federal Highway Administration [FHWA] cost data). Virtually without exception, the incremental savings in future highway maintenance, rehabilitation and highway user costs will far outweigh the incremental costs of thicker pavements.

A typical concrete pavement section on rural Interstate highways today is 10" thick. According to current AASHTO design procedures, this design will accommodate a minimum of 5 million 18,000 pound axle load applications (or its equivalent). Eight times more durable than a 10" concrete pavement, a 14" concrete pavement adds but 15% to pavement related construction costs and less than 2% to the total construction cost of a new highway. Pavements on main line truck routes should be built at least 14" thick.

The economies of scale of thicker pavements have long been acknowledged by the highway engineering profession. In testimony before this Subcommittee, FHWA has stated that pavement strength goes up with the seventh power of pavement thickness. Our analysis of the last two AASHTO pavement design guides yields the same basic results.

Given this information, it is incomprehensible that our major highways were not designed to take greater advantage of the efficiencies of stronger and thicker pavement structures. Built right the first time, our highways will hold up better, rehabilitation and maintenance costs will be less, direct user costs will be lower, and the trucking industry will be far less

concerned about a consumption method of highway cost allocation. The trucking industry is paying for these highway engineering oversights. Ultimately, these oversights will make U.S. products non competitive.

Pavement And Bridge Management

One of the most important tasks for highway administrators is the preservation of highway infrastructure. FHWA policy requires the States to adopt systematic procedures to select, design and manage federal-aid highway pavements. Pavement management systems should identify cost-effective strategies for building, evaluating and maintaining pavements in a serviceable condition. ATA supports these requirements.

For major highways carrying significant truck traffic, however, FHWA policy must ensure that pavement types and structures will satisfy the requirements for long-range durability. All too often, States apply temporary band-aids to improve major highways with less than optimal pavement structures. Such practices serve neither the interests of economic efficiency nor the needs of the traveling public. ATA supports a pavement design policy that minimizes long-term life-cycle construction, maintenance and highway user costs for major highways -- a policy that requires the construction of stronger and thicker pavement structures with better draining base courses.

FHWA is also encouraging States to adopt cost-effective strategies for rehabilitating and maintaining highway bridges. These systems will evaluate alternative investment strategies and optimize agency bridge expenditures. ATA supports these requirements.

The Transportation Research Board estimates that 120,000 of the 550,000 bridges on non-Interstate and non-federal aid highways are posted, indicating inadequate load-bearing capacity to accommodate legal vehicles. These restrictions significantly limit the productivity of motor carriers using these bridges, and force heavier vehicles to take longer, less efficient routes. ATA recommends that States be permitted to use federal-aid funds to strengthen the load-limiting features of non-Interstate and non-federal aid system bridges without concurrent upgrading of bridge geometric features. Many substandard bridges can be strengthened with low-cost retrofits.

Highway Funding

ATA supports a federal highway program which increases expenditures from the present $12.5 billion annually to at least $17.5 billion in the new bill. This size program can be supported by drawing down the present $11 billion balance in the highway account of the Federal Highway Trust Fund over the 4 years to 1995. The larger program will enable the states to significantly improve the new National System as well as

increase expenditures for off system roads and bridges where most needed. This new National network will provide for improved mobility into the future for all highway users.

To ensure adequate and stable funding for a federal highway program which keeps pace with traffic growth into the next century, the Federal Highway Trust Fund must be made permanent. All available Highway Trust Fund revenues should be expended. Moreover, the large balance in the Fund permits a major increase in funding without increasing highway user taxes. Commercial trucks contribute over 42 percent of the revenues in the Federal Highway Trust Fund, or $14 million per day. These federal taxes include fuel taxes, tire taxes, truck sales taxes and heavy vehicle use taxes. As a significant contributor, the trucking industry strongly believes that all income to the Highway Trust Fund must be expended. Any other action simply adds to the balance in the Trust Fund and breaks the promise that all of the revenues collected and earned will be spent for authorized purposes. ATA recommends that the federal highway program be funded at a level of $17.5 billion or any higher level which can be supported by drawing down the Highway Trust Fund balance through FY 1995.

Highway users have paid the entire cost of the Federal and most state highway programs through a tax system of registration fees and fuel taxes. Weight distances taxes are inefficient, inequitable, and are opposed. In particular, a federal weight distance tax based on gross weight will be vigorously opposed and is unnecessary to meet trucks' highway cost responsibility.

Diversion of Highway Trust Fund revenues to non-highway purposes seriously hampers this nation's ability to preserve its highway infrastructure. Since enactment of the Highway Trust fund, a number of non-highway expenditures have been shifted to the Highway Trust Fund. This diversion includes: rail relocation expenses, bikeways, parking lots, ferryboat construction and various transit expenditures. At a time when the highway infrastructure has deteriorated significantly, continued diversion of Highway Trust Fund revenue to non-highway purposes is unjustified. In addition efforts to increase fuel taxes for General Funds or other public purposes would have serious adverse impact on the states ability to increase fuel taxes for highway purposes. Reducing highway expenditures for deficit reduction or any other non-highway purpose is opposed.

A serious drain on the Highway Trust Fund is the current exemption of gasohol from the federal motor fuel taxes. The federal gasohol exemption costs the Highway Trust Fund nearly $500 million annually ($482 million in FY88). Since 1979, losses have amounted to more than $3 billion. Ironically, $3 billion could double our annual investment in bridges for a year. All alternative fuels must be taxed at levels equivalent to the gasoline or diesel fuel tax which they replace. If there is to be a federal subsidy for alternative fuels, it should be paid by all taxpayers and evaluated on the same terms as other spending or tax preferences.

Tolls

ATA supports the basic concept of a toll-free National Highway System. Financing of highway improvements should rely on highway user taxes and receipts, exclusive of tolls. ATA opposes any use of federal aid highway funds in conjunction with tolls either for new highways or for highway reconstruction.

In particular, ATA will oppose any use of federal aid funds to reconstruct an older Interstate or primary route and then turn it into a toll road. When toll financing is used, toll collections should be limited to and fully cover the costs of constructing, reconstructing, and maintaining the toll facility. Toll collections should not be used for the extension of bonded indebtedness or for the creation of new indebtedness for other facilities.

The payment of highway user taxes, in addition to tolls on the toll highways, constitutes double payment for the use of these facilities. For example, a 5 axle tractor semi-trailer traveling from Baltimore to New York on Interstate 95 and the New Jersey Turnpike, which is largely toll roads or bridges, will pay at least as much in tolls as in fuel taxes--$25. In addition, this vehicle pays federal truck use and state fuel taxes and registration fees. Since the tolls pay the cost of most of the highways and bridges on the route, the highway user taxes are available for other highways or for diversion to other state purposes. Maryland, Delaware and New Jersey each divert a substantial portion of highway user taxes to nonhighway purposes. State highway user taxes should be eliminated on toll facilities.

38-253 O—91——27

The consequences of granting a tolling authority independent bonding authority are dramatically illustrated in the recent experience in New Jersey. A $2 billion bond issue was floated without any specific plan or coordination with other transportation or environmental state agencies. The need for a specific plan for bond revenue use far exceeds any short term financial gains achieved by early issuance of the bonds.

Truck size and weight limits allowed on toll facilities should be grandfathered when tolls are removed. For example, the Ohio Turnpike is scheduled to revert to a toll free road in 1992. The Ohio Turnpike currently permtis 48' double trailers on the Turnpike with a special project permitting one company to run triple trailers. These projects have been highly successful both in terms of safety and productivity. This productivity benefit should be grandfathered in when the Turnpike becomes a toll free road.

Programs designed to reduce congestion through assessment of fees for use of roads during peak travel periods attempt to discourage travel rather than increase mobility. The goal of a forward looking federal highway program should be to seek positive solutions to transportation problems, not to institute barriers or tolls to discourage or prevent mobility. Congestion pricing is not a viable alternative to highway improvements to provide new capacity.

Transportation System and Incident Management

Traffic congestion is a growing problem for the trucking industry and a major impediment to the free flow of commerce in, around, and through urban areas. Long a problem for local pick up and delivery services, congestion has rapidly spread to urban beltways and other through routes, adversely affecting the efficiency of line-haul goods movements.

A number of actions can be taken by highway agencies to increase the supply of highway facilities in urban areas that go beyond the traditional methods of new highway construction and freeway widening. These have come to be known as transportation systems management strategies -- improvements such as coordinated traffic signals, ramp metering, freeway surveillance and control systems, driver information systems, and coordinated response plans to incidents and accidents. ATA strongly supports these concepts.

The delay caused by freeway incidents and accidents is a big issue for our industry. To address this concern, the Trucking Research Institute has initiated a major research project to determine better ways to deal with non-recurrent congestion caused by freeway incidents and accidents, involving both cars and trucks. The study will develop a program of initiatives -- grants, policies, model legislation, information and demonstrations -- that can be advanced to expand and improve incident management programs in urban areas. The study will be completed in August, and copies of the report will be provided to the Subcommittee.

Trucks must have freedom to move at all times on the nation's highways, roads and bridges in order to provide essential transportation between American communities, businesses, and industry. Trucks of a size and weight authorized by the Surface Transportation Assistance Act of 1982 and longer combinations or trailer lengths subsequently approved should not be restricted on the Interstate System or on a system of Highways of National Significance either through outright prohibition or restrictions on hours of operations. Route restrictions should only be for safety reasons and should be of limited duration. Such routes should be quickly upgraded to adequate standards. Unreasonable state or local restrictions must be prevented through Federal intervention.

III. THE PRODUCTIVITY OF THE TRUCKING INDUSTRY

The performance of the nation's economy in increasingly competitive international markets depends in large measure upon an effective and efficient transportation system. To achieve efficiency, the trucking industry must be able to operate its most productive equipment to serve the facilities of shippers and receivers throughout the nation.

As the nation's premier mover of freight, the American trucking industry has long recommended reasonable size and weight standards consistent with highway capability and the need for efficient, intelligent, and productive use of our country's vital resources. Alternative bridge formulas or modifications of the current Federal Bridge Formula may provide greater efficiency, safety, and maneuverability in the movement of goods without harm to roads and bridges. Current federal limits on gross vehicle weight should be removed to permit gross weight regulation through application of an appropriate federal bridge formula to individual axle weights.

Access

It is essential that all vehicle types approved by the Surface Transportation Assistance Act of 1982 and longer vehicles grandfathered or subsequently approved be permitted to operate on the Highways of National Significance. In order to achieve necessary productivity, the trucking industry must be allowed access to points of loading and unloading from this new

National System. States, counties and cities cannot be allowed to thwart National productivity through ordinances or regulations restricting or banning trucks without evidence of specific safety problems.

FHWA has had a formal rulemaking on access for STAA approved semi-trailers and twin trailer combinations underway for more than three years. Final comments on the Rulemaking were received on December 1, 1989 and the final rule is reportedly under review by the FHWA. Publication of the final rule is expected in late spring.

The STAA specifically required states to provide "reasonable access" for the combination vehicles approved by the Act. Yet today, more than 7 years after passage of STAA several key states have not yet established adequate designated highway systems or provided reasonable access for STAA approved combinations.

In addition, local jurisdictions which have long provided access for STAA vehicles have suddenly reversed positions and are issuing citations for both overlength and overwidth. The city of Phoenix is a current example of a reversal. Since January, Phoenix has issued many hundreds of citations to carriers who are trying to deliver to shippers or reach terminals in Phoenix which have been open to the same STAA approved vehicles since 1983. A strong FHWA decision on access is essential to end such harrassment of carriers trying to provide requested service to shippers.

Weight Measurement

A second area of concern regarding truck size and weight limits is the issue of inadvertent overloading of axles and/or scale error. Many motor carriers load vehicles at sites where scales are not available and thus may inadvertently overload an axle or tandem axle. Further, there are frequently small differences in scales at high weights even when properly calibrated. Consequently, ATA requests that Congress allow the states to levy no fine or a low fine for axle overloads of less than 500 pounds. This is particularly needed at this time since several states have greatly increased overweight fine structures to establish minimum fines as high as $200 in Pennsylvania. In addition, several states charge administrative or court cost fees which may greatly exceed the overweight fine. Large fines for inadvertent overloads of a few hundred pounds appear to be excessive and Congressional action to provide guidance to the states and localities is needed.

Studies

Prior to June 1990, four studies of possible changes in truck weight or size limits will be completed and made available to the Congress:

- The Transportation Research Board (TRB) Truck Weight study was requested by the Congress and will consider all aspects of current federal weight regulation.
- TRB's Turner Study will report on a proposal by former FHWA Administrator Frank Turner which proposes various vehicles with lower axle limits and higher gross weights.
- The FHWA study of truck weight, similar to the TRB study.

- The Trucking Research Institute study of the economic benefits of several types of longer combination vehicles currently operating in states in the West under special permits.

These studies will provide information on benefits and costs, safety, pavement and bridge wear related to various changes in vehicle weight or size which may produce improved productivity for the trucking industry. Currently, states are forbidden by Federal law to allow trucks in excess of 80,000 pounds to operate on the Interstate system (unless they were allowed before the law became effective). ATA urges the Congress to carefully review the findings and recommendations of these studies to determine whether increased productivity may be possible through allowing states greater flexibility in setting weight limits for the various types of vehicles discussed in the studies. Several states now allow higher weights on axles or by special permits under "grandfather" provisions. These are extremely important to the economy in all of the states where they are permitted. ATA will vigorously oppose any effort to withdraw or roll back these grandfather provisions.

ATA understands that the TRB Truck Weight study will recommend higher gross weights based on the very high benefits to the economy compared to pavement and bridge costs. Similarly the Turner study is reported to propose higher gross weight combined with lower axle weights. The Longer Combination Vehicle (LCV) study also reportedly finds large benefits to the economy from higher gross weight for these combinations. These studies also have various recommendations for equipment, safety and driver regulations. Other changes such as set back front

axles, adjustments to the bridge formula and special vehicle design may further enhance productivity. Major benefits to the Nation's economy can be achieved from these proposed changes.

Multimodal Transportation

Historically, Congress and the federal regulatory agencies have viewed trucking as a domestic transportation mode, influenced little by international trade, competition, and transportation trends. However, the rapid growth of domestic and international containerization of freight in recent years has resulted in increasing numbers of maritime shipping containers being transported over America's highways. As a result, the trucking industry finds itself an integral part of international commerce and multimodal transportation.

According to a recent study by FHWA of data compiled by the Journal of Commerce of import/export containers moving through the ports, one-third of the containers are carrying cargoes at weights that could cause the vehicle transporting it to violate Federal vehicle weight laws. The containers are loaded on trucks without giving the trucker any indication that the shipment is overweight--gross or axle. These overweight containers have the potential to increase damage to highway pavements and bridges and to impair vehicle performance, resulting in safety problems.

Overweight international containers--both import and export--have traditionally been viewed as a truck weight enforcement problem and not as an international competitiveness problem. This is primarily because they became illegal only when they were transported over the highway. Tickets for overweight containers are issued to the trucker even though the trucker has no control over the weight or loading of the container and may not be aware of the container weight. In some cases, the trucker is forced to take an overweight container because of competitive pressures and the excess capacity which exists in this segment of the market. Some means must be found to shift this burden from carriers to shippers.

The Federal Highway Administration (FHWA) has taken the lead on the overweight container issue. To its credit, it recognizes that the trucker is not responsible for the overweights and that culpability must be directed at the party responsible -- the shipper. Unfortunately, the FHWA, as do other regulatory agencies, lacks authority to solve this problem, as well as other issues that arise out of multimodal transportation operations. As a result, these issues, although increasingly important, fall through the "bureaucratic cracks." For example, federal agencies cannot:

- Issue regulations which make the shipper responsible for overweight containers;
- Require shippers, both domestic and international, to indicate the actual weights of individual containers on standardized shipping documents;

- Require state uniformity for issuance of overweight container permits;
- Require ports and/or marine terminal operators to confirm declared shipment weights before import containers leave port property;
- Require owners of intermodal equipment, chassis and piggyback trailers, to provide inspected, well-maintained and appropriate running gear in accordance with new Federal annual vehicle inspection requirements; and
- Eliminate steamship freight rates which are currently based on container rates and not actual cargo weight.

These issues will not go away. As multimodal and international transportation activities increase, the problems will become worse. Therefore, we urge this Subcommittee to recognize the uniqueness of multimodal transportation needs and provide the appropriate regulatory agencies, (FHWA, FMC, ICC), statutory authority to establish rules affecting multimodal transportation. In addition, this Subcommittee should legislate shipper responsibility laws, placing the burden of illegal overweight shipments on the party who controls and tenders the loads.

ATA believes there are three principles that should guide the solution to multimodal problems:

- Motor carriers have the right to know container weights and axle weights before they leave the port or the shipper's dock
- If given incorrect weight information which results in fines, penalties or civil liabilities, motor carriers should be entitled to recoup their losses from the shipper
- Carriers who refuse to carry unsafe loads should be protected from shipper retaliation

IV. THE CUMULATIVE BURDEN OF STATE TAXES AND FEES

The trucking industry is faced in many states with a wide variety of operating taxes and fees that discriminate against interstate motor carriers. Fuel tax decal fees, which have been held unconstitutional by the United States Supreme Court, are still levied by 20 states.

Motor carriers' problems with state and local general business taxes are relatively new, but they are serious and growing fast. The United States Supreme Court has ruled that interstate motor carriers doing business in a state may be asked to pay a fair share of the state's general business taxes, for example, corporate income taxes and gross receipts taxes. Many states now require carriers that merely pass through on the highway to pay these taxes in addition to highway taxes. Some states are engaged in widespread enforcement programs under which carriers are being assessed for several years' back taxes, interest as well as a penalty, for not having filed. Guidelines for states are urgently needed in this and related areas.

Section 19 of the Motor Carrier Act of 1980 required the Department of Transportation to complete a study on the problems motor carriers had with the lack of uniformity among the states. DOT estimated that nonuniformity in state highway taxation of the motor carrier industry was costing $1 billion a year. In 1985, DOT funded a study by the National Governors' Association

(NGA) to find ways to eliminate or reduce this drain on the trucking industry and the economy. In 1987, NGA recommended that the states to adopt an eight point program:

- o Establish a Motor Carrier Advisory Committee
- o Join the International Registration Plan (IRP)
- o Adopt the Uniform Fuel Use Tax Report Form
- o Adopt the Six Point Plan for Fuel Use Tax Reporting
- o Join a Base State Fuel Use Tax Reporting Agreement
- o Work Together to Address Uniformity in States that Assess Mileage-Based Taxes
- o Eliminate Retaliatory Taxes
- o Institute Simple, One-stop Operations for Motor Carriers

Unfortunately, the recommendations are being implemented too slowly. In 1985, it took 107 pieces of paper to operate a truck legally in all 48 contiguous states. Today, it still requires about 100. To accelerate the implementation of the NGA recommendations, FHWA issued a contract to the Trucking Research Institute to develop a training course for states to use in the implementation of the International Fuel Tax Agreement (IFTA), one of the eight points of the NGA Consensus Agenda. This will provide a means by which the momentum of the NGA uniformity effort can be brought to fruition. Universal adoption of IFTA by the states will go a long way toward reducing the $1 billion paperwork burden. We think this is a good investment of Federal dollars. Congress should require FHWA to endorse the International Fuel Tax Agreement and push for its adoption with a date certain when all states must adopt it.

The trucking industry is restricted to state courts in its legal challenges to state and local taxes that are burdensome, discriminatory or otherwise illegal. We cannot get these cases into federal courts. Railroads can.

Federal law permits railroads to challenge any discriminatory state or local tax in federal district court. This law has been very useful to the railroads. Our industry can only go to federal court with regard to discriminatory property taxes, an area where our problems are relatively minor. Federal legislation granting the trucking industry the same right as that enjoyed by the railroads is clearly needed to provide motor carriers relief from unconstitutional state and local taxes.

V. THE IMPORTANCE OF SAFETY

Motor Carrier Safety Assistance Program (MCSAP)

According to the Fatal Accident Reporting System (FARS) of the U.S. Department of Transportation (the most reliably collected truck accident data on a national scale) the data from 1976 to 1986 indicates that fatal accident rates per million truck miles have steadily fallen through the 1980's. (See chart below)

Fatal Accident Statistics for Combination Vehicles

1976-86

	Number of Fatal Accidents	Vehicle Miles Traveled (billions)	Fatal Accident Rate (per 100 million miles)
1976	3260	49.7	6.56
1977	3613	55.7	6.49
1978	4066	63.0	6.45
1979	4307	67.0	6.43
1980	3731	68.7	5.43
1981	3863	69.1	5.59
1982	3519	66.7	5.28
1983	3645	69.8	5.23
1984	3907	77.4	5.05
1985	3892	79.6	4.89
1986	3825	82.7	4.63

Note: Combination vehicles include all separate tractor-trailor combinations.

Congress passed the Surface Transportation Assistance Act (STAA) in 1982, which in addition to changing truck size, weight, and configuration limits, initiated the Motor Carrier Safety Assistance Program (MCSAP). Since the passage of the Act

authorized funding for this program in FY 1984, this extremely successful federal - state partnership to reduce commercial motor vehicle accidents has received increased funding levels every year to its present level in FY-90 of $60 million. We believe the program should continue and that funding should be increased.

ATA has been a supporter of this program from its inception and continues to believe that increased funding will provide a positive impact on motor carrier safety on the nation's highways. However, we believe that increased funding should be directed towards providing more effective training for inspectors charged with the responsibility of inspecting commercial motor vehicles. ATA also believes that these inspectors should continue to focus enforcement on all commercial vehicles as currently defined in the Federal Motor Carrier Safety Regulations.

There needs to be increased emphasis placed on insuring that all enforcement officers who inspect commercial motor vehicles have received an appropriate level of certified and uniform training. This training will guarantee that an inspection conducted in one state is the same as the inspection which will be received in another state. That is not the case throughout the country today.

The motor carrier industry is being required to submit to a host of different types of inspections conducted at every type of location from a modern garage-type facility to a narrow shoulder of a secondary state highway. These inspections are

being conducted by a variety of inspectors some of whom have received hundreds of hours of intense mechanical and safety training. However, inspections are also being conducted by inspectors who after a three day safety regulation program begin stopping trucks to inspect complex mechanical components of modern commercial motor vehicles. There needs to be a more effective system of federally sponsored training which will upgrade and improve the skill level of all inspectors so that the quality of inspectors and inspections will improve.

DOT should also work with the states to insure that state enforcement programs under MCSAP which require the adoption of regulations compatible with the Federal Motor Carrier Safety Regulations (FMCSR) are continued. The recommendations of the Commercial Vehicle Safety Review Panel concerning uniform motor carrier safety regulations should be adopted as swiftly as possible and the strong sanctions imposed on states which do not comply should be enforced.

Also in the area of uniformity, DOT should be urged to continue to support the activities of the Commercial Vehicle Safety Alliance (CVSA) in dealing with the problem of uniform fines and sanctions for motor carrier safety violations. The problem of states and localities charging widely varying fines for the same violation has reached epidemic proportions. CVSA is aware of the problem and has begun to address it. Congress should encourage the Federal Highway Administration (FHWA) to do all that it can to urge states to adopt the recommended maximum fine schedule being developed by CVSA.

Commercial Drivers License Program (CDL)

ATA was a key supporter of the legislation which Congress passed to mandate a single drivers license for operators of commercial motor vehicles. We have been a participant at every step of the regulatory path in the development of the CDL program. We believe the CDL program will improve the quality of commercial vehicle operators and improve safety on the nations highways.

As states have begun to implement the CDL program ATA has closely monitored all phases of the process in order to expedite program implementation and provide assistance to motor carriers. Although some states have encountered difficulties with certain aspects of the required CDL program components such as standardized violation codes and hook-up to the Commercial Drivers License Information System (CDLIS), we are satisfied at this time that FHWA has dedicated the necessary resources to assist states in meeting the April 1992 required implementation date. Congress should closely monitor the state implementation process in order to insure that all states will meet the required CDL program implementation date.

65 mph Speed Limit

The trucking industry was a key supporter of the national 55 MPH speed limit. We were one of the loudest opponents of the move to increase the speed limit to 65 MPH. We continue our opposition to the 65 MPH speed limit and urge Congress to again consider a rollback to the 55 MPH speed limit. To facilitate

this rollback, we request that DOT be required to gather accurate data on accident experience of the states since the change to the higher limit. This data will document the increased loss of life and injury to the American public and provide a basis for decreasing the speed limit to 55 MPH. We believe that these statistics along with the undeniable fuel savings of a lower speed limit should be the basis for a Congressional effort to again reduce the national speed to 55 MPH.

Rest Areas

The trucking industry is becoming increasingly aware of the lack of sufficient parking at roadside rest areas which will serve the needs of increased truck traffic.

In the last decade, the number of trucks on the road has increased 24% and the average annual miles each truck travels has increased 27%. Annual truck volume on urban and rural interstate highways has increased by 8% and 5% respectively.

However, in the same period of time there has been little or no new construction in truck stop rest area facilities. This lack of expansion has led to overcrowding of present facilities and has forced drivers as a result to either find other parking arrangements or violate hours of service regulations. Many states in order to relieve overcrowding in rest areas have resorted to allowing drivers to only stay four hours in rest

areas. As a result drivers are at times parking in less-safe locations such as highway shoulders or on exit/entrance ramps to interchange.

Fatigue has been cited as a major factor in as many as one third of the fatal accidents which were studied in a recent National Transportation Safety Board (NTSB) investigation. Drivers need safe areas to take rest breaks to prevent fatigue related accidents and to comply with hours of service regulations.

Congress should consider providing additional funding to states to develop new roadside rest-stop areas or expand current facilities to handle the expanded needs of motor carriers.

Off-Ramp Signing

Unlike most aspects of highway design, off-ramp designs do not generally make adequate allowance for the special requirements of trucks. This was indicated in a review of the Federal Highway Administration accident file for 1980 which revealed that 9% of all jackknife accidents and 17% of all rollover accidents occurred on off-ramps while only a very small percentage of commercial vehicle travel was on off-ramps. Truck dynamics must be given greater consideration in future construction.

Although there is a need to identify and reconstruct a number of existing off-ramps to make them safer for trucks, there is a low cost project which can be done relatively quickly

without high construction or land acquisition costs. This is to develop and implement (including driver training) a signing program to provide truck drivers with the information needed for judging the speed which should be utilized in negotiating off-ramps.

Off-ramps today are generally posted with one speed which is usually based on passenger car rather than truck performance. A University of Michigan study points out that the safe speed of passenger cars on ramps is limited by tire traction whereas for loaded trucks it's rollover. Loaded trucks will usually rollover before their tires skid.

Trucks also have problems with off-ramps which incorporate curves having different radii. If the driver does not realize that the second curve in a ramp is tighter than the first, he may, after conservatively negotiating the first part of the ramp, increase his speed to obtain a safer and more effective merge speed, only to lose control in the tighter, second half curve.

Another problem for trucks is that they cannot always accelerate and decelerate safely as fast as passenger cars, therefore, some of the acceleration and deceleration lanes are not as long as they need to be for trucks.

<u>Congress should require DOT to implement a signing policy which indicates the ramp speed for trucks as well as passenger cars.</u>

Downgrade Signing

In addition to the need for an effective method of signing off-ramps for trucks, there is a need for the signing of downgrades to advise drivers of the proper speed and gear selection for the descent. This problem is widely recognized and the FHWA has already developed an excellent new signing method (Grade Severity Rating System) to address the problem.

This new signing procedure, however, has not been universally implemented because of the lack of funds. Funds are needed not only for the signs, their construction and installation but also for the training of drivers as to how to properly interpret them. Congress should require states to implement the downgrade signing program developed by FHWA.

VI. THE NEED FOR TRUCKING-RELATED RESEARCH & DEVELOPMENT

The Fiscal Year 1991 federal budget includes $71 billion in budget authority for research and development. Of this total, $1.5 billion is earmarked for "developing technologies for improved transportation." More than two-thirds of these transportation-related R & D funds will go to to the National Aeronautics and Space Administration. DOT's share of the $1.5 billion is just $422 million -- less than 30% of the total.

The $422 million for DOT R & D includes the following proposed expenditures:

- $191 million for research, engineering, and development at the Federal Aviation Administration;
- $30 million for research and analysis at the National Highway Traffic Safety Administration;
- $23 million for Coast Guard research, development, test and evaluation;
- $17 million for railroad research and development expenditures by the Federal Railroad Administration, including $6.2 million for magnetic levitation and high speed rail (with another $3.5 million earmarked for "mag lev" research by the Army Corps of Engineers);
- $13 million for the Federal Highway Administration to develop intelligent vehicle/highway systems (IVHS) to address congestion; and
- $1.8 million for motor carrier safety research and development work within the Federal Highway Administration.

Given that more than 40% of intercity freight is carried by trucks, and that 77% of national expenditures on freight movements go for trucking services, there is something seriously amiss in the allocation of federal transportation-related R & D

expenditures. The $1.8 million in direct expenditures on trucking-related R&D amounts to 0.4% of the DOT total. Assuming that the trucking industry benefits, to some undetermined degree, from R & D expenditures at NHTSA and on IVHS to address congestion, total R & D expenditures benefiting trucking might reach $10 million or so -- still less than 2.5% of the DOT total.

Moreover, of the small amount being spent on trucking-related R & D, the vast majority is being spent on research designed to serve the regulatory agendas of DOT agencies. While research in support of regulatory activities is a necessary and legitimate expenditure of federal resources, R & D devoted to enhancing transportation productivity and international competitiveness should be an equal priority.

Indeed, federal R & D expenditures benefiting other transportation modes often are targeted expressly at improving productivity and competitiveness. Take the $9.7 million budgeted for maglev research during FY 1991, for example. The FY 1991 budget document notes that: "This increase in funding [from $2 million in FY 1990 to $9.7 million in FY 1991] is intended to explore the possibility of stepped-up U.S. efforts in this important emerging technology. The focus of the expanded program will be to determine the role of magnetic levitation transportation in the U.S. transportation system, the

economic feasibility, the appropriate safety and operating standards, and the remaining technologies that must be developed to achieve an efficient and environmentally acceptable U.S. system.

Going further, the FY 1991 budget includes the following description of the Federal Railroad Administration's "contractual support" program: "Contractual support is used to develop positions regarding structural industry changes such as mergers and to conduct internal studies dealing with traffic, economic forecasting, financial condition, labor-management activities and other factors that contribute to an efficient national freight railroad network." The budget estimates that FRA spent more than $13.5 million on such "contractual support" activities during FY 1990.

Nowhere within the federal government are such expenditures being made to advance trucking productivity and technology. The upcoming reauthorization of the Federal-Aid Highway Program presents an ideal opportunity to correct these inequities in transportation-related R & D expenditures.

Beginning in FY 1992, $50 million should be earmarked each year for trucking-related R & D expenditures within the Department of Transportation. These funds should be employed for research, development, and demonstration programs aimed specifically at enhancing trucking safety, productivity and international competitiveness. These programs should be pursued cooperatively between government and industry, so that each has a say in the conduct of the research and a stake it its outcome.

In many ways, the research expenditures being made by the Federal Railroad Administration on behalf of the nation's railroads can serve as a model for future government-sponsored trucking research. Take traffic and economic forecasting studies, for example. Many long-time FHWA officials will admit, at least informally, that the agency seriously miscalculated future levels of truck traffic when it began funding the construction of the Interstate System. Consequently, pavements were suboptimally designed and wore out much sooner than predicted. Society in general has suffered from the results of these poor forecasts; so, too, has the trucking industry, which is now having to pay higher road user taxes to repair prematurely deteriorated highways. Had FHWA been carefully monitoring economic trends in trucking, these early miscalculations could have been corrected or, perhaps, eliminated entirely.

Likewise, FRA research on emerging rail technologies (maglev and high speed rail) should be emulated by FHWA. Who at FHWA (or anywhere else in DOT) is carefully analyzing the national safety and productivity gains that may be had from innovative new kinds of trucking equipment (such as swap body trailers now in use in Europe; longer trailer combinations coupled with improved braking and handling systems; advanced driver information systems for commercial vehicle operators; etc.)?

Many of these technologies can be researched and tested only through cooperation between the public providers of the roadway infrastructure and the private operators of the more productive trucking equipment.

VII. THE NEED FOR A MOTOR CARRIER ADMINISTRATION

To implement the R & D program recommended above, ATA supports the creation of a Motor Carrier Administration within DOT. As noted at the beginning of this statement, trucking is the largest freight transportation mode--hauling more tons, employing more people, paying more taxes, and traveling more miles than any other mode. Unfortunately, it is not fully represented at the DOT. Every other mode has a modal administrator; trucking does not. Equity demands that a trucking administration be established.

Furthermore, there is a tremendous need for such an Administration to deal with the numerous issues which arise from motor carrier operations and which must be dealt with by the Federal government and by Congress. While FHWA has tried to address the issues of trucking, its primary responsibility is building highways. Not all problems in the trucking industry which need to be addressed by the Federal government are highway-related, including:

- General state business taxes;
- Multistate income taxation of interstate drivers;
- Human resources, including workers' compensation;
- Insurance/Tort Reform;
- Intermodal coordinaton;
- International trade, competition, and transportation; and
- Quality and availability of labor.

The increased annual cost resulting from a Motor Carrier Administration is only $2.4 million per year, according to a General Accounting Office report--less than DOT spends in one hour for all its other programs. ATA respectfully suggests this Subcommittee provide authorizing legislation for a Motor Carrier Administration.

VIII. CONCLUSIONS

It is esential to the economic well-being of the American trucking industry that the federally-aided highway program be reauthorized and strengthened. A program to meet both the repair needs as well as to provide increased capacity should be developed. Highways should be build better, with better drainage, greater strength, better geometric and off ramp designs, all to provide longer highway life.

An expanded, multiyear program should be funded by drawing down the unreasonably high balances in the highway trust fund and without resorting to increased user fees. Such a program should have as its basis a system of National Significance composed of a completed Interstate System and the major elements of the primary system. The Highway Trust Fund should be made permanent. Exemptions should be ended and evasion stopped.

No Federal funds should be expended for toll roads. Previously constructed Interstate highways must not be turned into toll facillities after reconstruction with or without federal funds. Tolls should be removed when bonds are paid off.

Federal funds should be increased for safety and research. MCSAP funding should be increased and inspectors better and more uniformly trained. States must establish CDL programs as required by 1992. Sharply increased truck research and

development funds are essential to enhancing truck safety, productivity and international competitiveness. Truck economic productivity should be increased based on research findings. Through these prudent investments, the U.S. can continue to compete and expand its stature in the global market-place.

A strong, well maintained federal highway system is essential to the efficient and productive operation of the Nation's trucking industry. As trucks increasingly provide the warehouse and distribution services for American manufacturers and shippers, good highways are the vital link to increased productivity and international competitiveness. In the face of expanding competition in the global market place, maintaining and improving the U.S. highway infrastructure is of critical importance to our economy. The keystone of the highway program must continue to be strong and growing federal highway funding if our highway infrastructure is to be able to provide the service our economy needs and desires.

FAX (212) 753-0134

PRESIDENT
MRS. EDWARD A. BLACKBURN, JR.

NATIONAL AFFAIRS AND LEGISLATION COMMITTEE

CHAIRMAN
MRS. LEE F. DRISCOLL, JR.
720 SWEDESFORD ROAD
AMBLER, PA 19002

Good afternoon, Mr. Chairman and members of the Subcommittee. I am Phoebe Driscoll. As Chairman of the National Affairs and Legislation Committee I am testifying for the Garden Club of America in support of H.R. 3389. Established in 1913, the Garden Club of America is a national organization with member clubs from coast-to-coast and in Hawaii. United by our love and concern for plants, our members come to Washington and to our seats of local governments to be advocates for the welfare of our plants which is directly tied to the welfare of our people. Plants, like people need clean air, clean water , and suitable habitats -- and people like you and me have the right to see our plants -- the flowers, grasses, shrubs and trees of our rural and urban landscapes. The imposition of billboards along our highways denies our right of view.

Since 1914, when the Garden Club of America established a committee on Beautifying Settlements and Highways, we have advocated billboard control. Today we strongly support H.R. 3389 -- the billboard Control Act of 1989 -- legislation that would halt construction of new billboards along federal highways and would return control over billboard removal to states and local governments -where it belongs.

The Highway Beautification Act of 1965 was supposed to protect our roadsides from billboards blight. Today the law does little more than protect billboard companies from local regulation.

In 1985 the U.S. General Accounting Office reported that new billboards were being erected three times faster than non-conforming billboards were being removed. Today, the removal of non-conforming billboards has essentially stopped. In fact, the Federal Highway Administration reports that only 385 non-conforming billboards were removed in Fiscal Year 1989. At this rate, it will take 260 years to remove the remaining 99,919 nonconforming billboards. Our members can't wait that long.

At the same time that removal of non-conforming billboards has come to a halt, the industry continues to erect thousands of new so-called "conforming billboards" in areas where they are completely out of place. Today billboards are being erected in National Register Historic Districts, in wetlands like those outside of the Assateague National Seashore, on the edge of national parks and monuments like the Gettysburg National Park, the Lowell National Historic Site, and the Smokey Mountains National Park, and even along designated scenic highways.

Last Fall when my husband and I drove the magnificent Skyline Drive in Virginia, we paid a fee to enjoy the billboard free scenery. However, we had to endure a barrage of billboard before entering -- litter on sticks. The fact that people pay to see scenery free of billboards suggests to me that people want scenery free of billboards.

Adding insult to injury to a gardener, as new billboards are going up, millions of trees on public land are being destroyed by billboard companies as they seek to make their billboards more visible. Many of the trees being destroyed were planted with taxpayers money -- yours and mine.

For example, the GAO's 1985 report stated that while Louisiana had planted 2 million pine trees between 1973-1978, the state now allows billboard companies to cut these trees down in order to enhance sign visibility.

The Garden Club of America urges Congress to reform the Highway Beautification Act. In particular we urge the Surface Transportation Subcommittee to halt the construction of new billboards and to allow state and local governments to remove existing billboards in and around historic sites and districts, local, state, and national parks, and along designated scenic roads. At a minimum no billboards should be allowed within one mile of our national parks and historic landmarks.

In addition, GCA urges the Surface Transportation Committee to halt the practice of allowing billboard companies to destroy trees and other vegetation on public rights-of-way near billboards.

Finally, GCA urges the Surface Transportation Subcommittee to restore local authority over billboards and to establish a category of scenic highways where no billboards would be permitted.

If you have sensed anger in my voice -- you are right. I am angry at the visual pollution of billboards that blemishes my view of our urban and rural landscapes.

Thank you for the opportunity to present the view of the Garden Club of America.

38-253 O—91——28

Summary of March 15, 1990 Statement of Thomas R. Stedman and Earl B. Eisenhart, National Private Truck Council, Before the Subcommittee on Surface Transportation of the Committee on Public Works Regarding Reauthorization of the Federal Highway Program

Introduction

1. Private carriers -- companies that operate truck fleets in support of their primary business, whether it be manufacturing, distribution, warehousing, retail or service, represent the most significant segment of truck operators. Private carriers operate approximately two-thirds of the nation's 1.02 million trucks weighing over 26,000 lbs. gross vehicle weight and haul well over half the nation's freight.

2. The cost and quality of highway transportation has a direct bearing on the productivity of American industry. A highway system which will allow American industry to be as efficient and productive as possible relies on two critical elements: the physical integrity of highways, roads and bridges, and a predictable and uniform system of regulations governing commercial vehicles.

Position of NPTC on Reauthorization of the Federal Highway Program

1. The physical integrity of our nation's highway system can only be maintained by:

   Increasing the level of highway investment

   Expanding the highway system

   Maintaining the Highway Trust Fund

   Not using the Trust Fund to reduce the federal deficit

   Not using highway user taxes for non-highway purposes (except "transit penny")

   Eliminating the gasohol exemption

2. State and local regulations governing commercial motor vehicles must be uniform and predictable if we are to make the most efficient use of our highway transportation system.

This can only be accomplished by:

Eliminating remaining restrictions on the efficient use of trucks

Promoting uniformity in state tax procedures

Limiting the sheer number and variety of taxes imposed on trucks

Providing access for vehicles authorized by federal law

3. More efficient vehicles (for example so-called "Turner vehicles") should be allowed to operate on the nation's highways. The use of such vehicles will reduce the costs of shipping by truck, help our ability to be competitive in international trade and help reduce air pollution and highway congestion.

4. Any increases in highway user fees should be preceded by drawing down the surplus in the Highway Trust Fund, a commitment to use highway taxes for highway purposes, and uniformity in state regulations.

INTRODUCTION

About the National Private Truck Council.

The National Private Truck Council (NPTC) was formed in the Fall of 1988 as a result of the merger of two long established but smaller organizations representing private carriers.

Collectively, private carriers represent the most significant segment of truck operators. Private carriers operate two-thirds of the nation's 1.02 million trucks in this country weighing over 26,000 pounds gross vehicle weight and haul well over half of the nation's freight.

The NPTC is fully representative of this extremely important group of truck operators. It represents fleets operated by Fortune 500 companies as well as those operated by regional and local businesses.

NPTC members operate virtually every type of commercial vehicle including tank trucks, 48 and 53 foot long semitrailers, 28 foot twin-trailer combinations, and straight trucks used in local delivery operations of enterprises such as bakeries, dairies and telephone companies.

NPTC members' operations are similarly diverse. Some own their own trucks and employ unionized drivers. Some lease both their trucks and drivers. Some do a combination of these things. Some operate solely as private carriers. Many also conduct some for-hire operations.

The Cost and Quality of Highway Transportation have a Direct Bearing On The Productivity Of American Industry.

Mr. Chairman, as you have pointed out, the fate of our highway transportation system will directly affect our domestic economic strength, our environment, and our overall quality of life. Why? Because highway transportation costs are embedded in virtually every product and service produced in America. The cost and quality of transportation have a direct bearing on profits, prices and capital investments. This in turn directly affects exports. It is very clear that American business can not remain competitive in world markets if we allow our highway system to deteriorate and if shippers and carriers are not able to make the most productive and efficient use of that system. Put simply, an efficient highway transportation system is needed to enable U.S. products to reach world markets at competitive prices.

The rest of the world is not waiting for the U.S. to "get its act together." For example, the nations of the European Economic Community will largely integrate their economies by 1992. This action is intended to make surface transportation more efficient and thereby make European products more competitive in all world markets. American business' ability to compete with the Europeans and others in the 1990's and beyond will depend in significant part on whether our own surface transportation system is more efficient.

A highway system which will allow American industry to be as

efficient and productive as possible relies on two critical elements -- the physical integrity of highways, roads and bridges, and a rational, equitable, predictable and uniform system of highway regulations governing commercial vehicles.

POSITION OF THE NATIONAL PRIVATE TRUCK COUNCIL
ON REAUTHORIZATION OF THE FEDERAL HIGHWAY PROGRAM

1. THE PHYSICAL INTEGRITY OF OUR NATION'S HIGHWAY SYSTEM MUST BE MAINTAINED.

The future financing of the federal aid highway system is a principal concern of NPTC. This system consists of the nation's most heavily traveled roads and bridges -- the lifelines for industry and commerce. They include primary, urban and Interstate highways. This system which makes up less than 22% of all roads in America carries over 80% of the traffic. There is no question that many of the roads and bridges that make up this system are in serious need of repair.

While we do not pretend to have all the answers to "where the money will come from", it is evident that a continued national commitment is necessary to ensure America's economic future. This must be a long term commitment shared by all levels of government and the private sector to maintain the value of existing surface transportation assets, meet essential future needs, promote national economic growth and productivity and ensure safety.

Maintaining the physical integrity of a highway transportation system that is efficient, economical and safe requires the following elements:

A sufficient level of highway investment

Selective highway expansion

Maintaining the Highway Trust Fund

Not using the Trust Fund to reduce the Federal deficit

Not applying highway user taxes to non-highway purposes (except "transit penny")

Elimination of the gasohol exemption

A. Increase the level of highway investment:

Our national highway program must include a level of funding sufficient to maintain the value of existing highway transportation assets, provide for selective highway expansion and ensure safety. The NPTC proposes a significant annual increase in highway funding to meet these needs -- from the current level to $17-19 billion per year. According to the Highway Users Federation, these funds can be obtained without the need to raise taxes by drawing down the balance in the Highway Trust Fund over the next several years. (Trust Fund balances should not be used as an artificial offset against the federal budget deficit.)

B. Expand the highway system:

We believe there is a need for selective additions to the highway system, particularly to relieve congestion in some urban areas and to serve emerging traffic patterns brought about by

demographic changes. A modest expansion of the highway system could provide new service in expanding suburban areas, in rural America, and to the growing cities of the South and West.

C. Maintain the Highway Trust Fund:

There are some who apparently believe that, now that the Interstate System is near completion, there is no longer a need for a highway trust fund. They believe highway user fee revenues should now be used to pay for "more important" federal programs. NPTC thoroughly rejects this argument.

The Highway Trust Fund has paid for the construction, improvement, or repair of more than half a million miles of roads. The Fund has financed the construction of the 43,000 mile Interstate Highway System and paid for the construction, replacement or repair of more than 18,000 bridges. It's a good program, Mr. Chairman, and we need to keep it. And we ought to make sure that those funds are used to take care of our unmet highway needs.

D. Do not use the Trust Fund to reduce the federal deficit:

Some have called for using the Trust Fund, or highway user taxes, as a means of reducing the federal budget. Congress has seen proposals to increase the gas tax by as much as 50 cents per gallon, with the new funds earmarked for deficit reduction. This is a bad idea, pure and simple. First, this would clearly destroy the concept of "trust" in the Highway Trust Fund. Second, taxes on fuels are regressive. This major burden of reducing the federal deficit would not be tied to ability to pay

but would be placed unfairly on individuals and businesses who must travel the highways to get to work or in the conduct of their business.

E. Do not use the Trust Fund or highway user taxes for non-highway purposes:

NPTC fully understands that American industry is being asked to pay substantially more in highway taxes and user fees. In fact this is already happening. Eighteen states have recently raised fuel taxes and most of the others are expected to follow suit shortly.

In addition, Secretary Skinner, through the new National Transportation Policy Statement has strongly suggested that industry will be expected to pay an even larger share through private financing of highways and additional toll roads. At the same time, however the Policy Statement falls short of a clear commitment that taxes paid by highway users into the Trust Fund must be used for highway purposes. The Statement speaks only of using the "transportation trust funds" for "transportation purposes." Highway users should not be expected to contribute to the costs of rails, airports and transit, beyond the so-called "transit penny."

Mr. Chairman, we are not shunning our responsibility to pay our fair share, but we think it reasonable to expect some assurances that the taxes and user fees which have already been paid and will continue to be paid into the Highway Trust Fund will in fact be used for the purposes for which we thought they

were collected.

To put NPTC's position simply, excluding the current so-called "transit penny", every cent that is collected from truck operators should be committed to highway purposes only.

F. Eliminate the gasohol exemption:

Not only should Congress preserve the Highway Trust Fund and ensure that the funds are available for highway needs, it should act to correct an existing drain on Trust Fund revenues by eliminating the 6-cent per gallon gasohol fuel tax exemption. This exemption results in a severe drain on Trust Fund revenues. According to The Road Information Program, this exemption costs the Trust Fund about $500 million annually -- more than $3 billion since 1979. Gasohol using vehicles cause the same wear and tear on the highways as other vehicles and should pay a fair cost of the maintenance and repair. With the likely increase in alternative fuel use to meet clean air demands, this exemption could cause an even greater depletion of revenues into the Trust Fund.

Mr. Chairman, a sound economy demands a sound infrastructure. Diversions and exemptions from the Trust Fund simply can not be tolerated if America is to have the efficient and productive highway transportation system it desperately requires.

2. STATE AND LOCAL REGULATIONS GOVERNING COMMERCIAL MOTOR VEHICLES MUST BE UNIFORM AND PREDICTABLE IF WE ARE TO MAKE THE MOST EFFICIENT USE OF OUR HIGHWAY TRANSPORTATION SYSTEM.

Resources for highway development are limited. It is critically important, therefore, that we make the most productive possible use of the system we have. Unfortunately, this simply can not be done under the current system of state economic regulations, tax procedures and operating restrictions.

Why? Because truck operators in the U.S. continue to be burdened by a blizzard of paperwork and other encumbrances resulting from the current hodgepodge of inefficient, confusing, and often conflicting state and local regulations. Only by achieving uniformity, simplicity and free access to our highway transportation system, will truck operators be able to make the most efficient use of that system.

Simply put, the multitude of barriers to efficient highway transportation in the U.S. seriously impedes the ability of our companies to be more productive.

This is an issue of overriding national importance: The need for American industry to be competitive in a world marketplace demands that these arbitrary barriers to efficiency be eliminated.

Specifically, NPTC recommends the following: elimination of remaining state regulatory restrictions on the efficient use of trucks; uniformity in state tax procedures; a limit on the sheer number and variety of taxes imposed on trucks and, greater

highway access for vehicles authorized by the Surface Transportation Act. These reforms would result in significant productivity gains without expense to the federal treasury.

A. Eliminate remaining state regulatory restrictions on the efficient use of trucks:

While efficiency in trucking operations was greatly enhanced by the Federal Motor Carrier Act of 1980, much more needs to be done to eliminate artificial economic restrictions. Economic restrictions result from outmoded state regulation of intrastate rates, routes and services. Such regulation is inherently anticompetetive. Private carriers, in particular, have been prevented from undertaking many efficient operations because of the failure of a number of states to allow, within their own jurisdictions, the opportunities provided under federal law. Approximately 36 states currently prohibit private carriers from engaging in compensated intercorporate hauling in intrastate commerce, and approximately 29 states prevent single-source leasing in intrastate commerce. Similarly many states also continue to impose stringent artificial restrictions on the issuance of operating authorities.

As an example of the high costs imposed by intrastate regulation of truck operations, it currently costs one NPTC member company $296.00 to ship 36,000 lbs. of cherries from Grandview, Washington to Portland, Oregon. However, an intrastate shipment of the same distance, from Grandview to Spokane, Washington, costs $597.00.

Efforts to rectify the problem in individual states, such as in Texas and Michigan, are ongoing. Those efforts, however, are extremely time consuming and costly, and can only address a small part of the national problem. Indeed, the majority of states continue to regulate as if the year was 1960 rather than 1990. Our Nation can no longer afford these antiquated and very costly barriers to commerce.

For this reason NPTC strongly endorses legislation, which was introduced yesterday by your colleague on this Committee, Congressman Denny Hastert, to finally eliminate these costly and burdensome state economic regulations on trucking. The legislation is supported by the Americans for Safe and Competitive Trucking (ASCT); a coalition of shippers, consumers, business organizations and trade associations, including NPTC.

President Bush and Secretary Skinner, in the National Transportation Policy Statement issued last week have also expressed strong support for eliminating the remaining economic regulations on trucking.

We urge the support of this Committee, as well, for this important effort to allow truck operators to make the most efficient possible use of our existing highway transportation system.

B. Promote uniformity in state tax procedures:

Much of the paperwork burden experienced by truck operators is the direct result of lack of uniformity in state tax procedures. While some progress has been made to simplify

vehicle registration requirements, state fuel tax and other tax procedures continue to be a major roadblock to efficient highway use.

We are extremely pleased that Congressman Hastert's bill would also help remedy this problem. Specifically, the Hastert bill would require states to become parties to the International Registration Plan and the International Fuel Tax Agreement.

The new National Transportation Policy has also endorsed a deadline for states to come into these uniformity agreements. We urge this Committee do so as well.

C. Limit the sheer number and variety of state taxes imposed on trucks:

The operating efficiency of American industry is also hampered by the sheer number and variety of taxes directed specifically at trucks. These taxes are imposed under a variety of names such as vehicle registration fees, fuel taxes, weight distance taxes, retaliatory taxes, pick up and delivery fees, franchise taxes and gross receipts taxes. In addition to the substantial administrative burden of compliance, these taxes often discriminate against interstate carriers.

The NPTC does not question the right of states to determine the aggregate level of taxes they raise. However, when hundreds of state and local jurisdictions are free to concoct a virtually limitless variety of tax measures directed at trucks, this has a strong negative influence on industry's ability to operate efficiently. Truck operators invest millions each year in an

effort to cope with this paperwork nightmare.

For this reason, NPTC is extremely concerned about the emphasis in the National Transportation Policy Statement on decentralized funding responsibility for highway construction and repair. While it may be true that local highway needs should be more directly financed by local assessment of user fees, NPTC is concerned that this greater emphasis on state and local financing of highways could lead to even greater proliferation of inefficient state and local tax schemes and inconsistent regulations such as those described above. We can simply not afford to further "Balkanize" the process of truck regulation in this country by allowing a system of local tax fiefdoms the opportunity to further limit the uniformity, simplicity and free access we need to make the most efficient and productive use of our highway transportation system.

D. Ensure reasonable highway access for vehicles authorized by federal law:

State restrictions on vehicle access are another contributor to lost productivity.

The inability of fleets to make greater use of the truck configurations authorized by the Surface Transportation Assistance Act of 1982 (STAA) has been a major contributor to lost productivity on our nation's highways. As a result of state and local restrictions, American business has not realized the productivity gains that come from using 48 rather than 40 or 45 foot semi-trailers. A 1987 survey of private carriers disclosed

that 69 percent of those responding were experiencing a variety of state and local impediments to the attainment of access for STAA vehicles. Examples included outright denials of access to terminals; mileage restrictions so severe as to be tantamount to no access at all; and, permit procedures, so time-consuming that carriers have had to wait as long as nine months to be approved. The survey also revealed that private carriers have been able to reduce their transportation costs between ten and twenty-five percent by using STAA vehicles. The potential savings, if these vehicle were allowed to operate freely, is enormous.

In addition, when companies are forced to use smaller, less efficient equipment, more trips are required to move a given amount of goods, further increasing transportation costs. At the same time, because additional trips are required, the chance of accidents is increased. From both an economic and safety standpoint, the denial of access to STAA vehicles is detrimental.

The Department of Transportation has the ability to remove this barrier to transportation efficiency. Rulemaking is currently underway which we hope will achieve this end. If not, industry may seek congressional intervention.

Mr Chairman, American industry must have uniformity and predictability in trucking regulation. We ask Congress to eliminate the sea of paperwork required to move trucks across this country. We challenge the sheer number and variety of taxes directed specifically at trucks. We urge elimination of state restrictions on highway access.

These are issues of overriding national concern. To resolve them, we need a clear definition of federal and state roles. The federal government should not hesitate to establish national standards and uniform procedures if this will lead to simplicity and free access in our national highway transportation system. We are certain this can be done with minimum capital, and with significant savings in transportation costs.

3. MORE EFFICIENT VEHICLES SHOULD BE ALLOWED ON OUR NATION'S HIGHWAYS

Research shows that it is possible to have higher capacity trucks that are as safe as other trucks (for example - so called "Turner vehicles"). We support the use of these more productive vehicles, because it will reduce the cost of shipping by truck, and also because it will help our nation's ability to be competitive in international trade and it will help reduce air pollution and highway congestion.

4. ANY INCREASE IN HIGHWAY USER TAXES MUST BE PRECEDED BY DRAWING DOWN THE SURPLUS IN THE TRUST FUND, A COMMITMENT TO USE HIGHWAY TAXES FOR HIGHWAY PURPOSES, AND UNIFORMITY IN STATE REGULATIONS

Even with use of the existing surplus in the Highway Trust Fund, it may be that, beginning in the mid 1990's, additional revenues will be necessary to maintain a sufficient level of highway investment. However, any increase in fuel taxes or highway user taxes levied at that time must be preceded by: 1) spending down the surplus already collected; 2) a national

commitment to use these taxes exclusively for highway purposes, and; 3) the ability of companies to make the most efficient use of the highway transportation system. The latter can only be accomplished by realizing the following productivity improvements: uniformity in state taxation; greater highway access; and, elimination of outdated state economic barriers.

CONCLUSION

The cost and quality of highway transportation has a direct bearing on the productivity of American industry and our ability to compete in international markets. A highway system which will allow American industry to be as efficient and productive as possible relies on two critical elements: the physical integrity of highways, roads and bridges and a predictable and uniform system of regulations governing commercial vehicles.

The physical integrity of our nation's highway transportation system must be maintained by: increasing the level of highway investment; expanding the highway system; maintaining the Highway Trust Fund; preventing the use of the Trust Fund to reduce the federal budget deficit; preventing the use of highway user taxes for non-highway purposes, and eliminating the gasohol exemption.

State and local regulations governing commercial motor vehicles must be uniform and predictable. This can be accomplished by: eliminating remaining restrictions on the efficient use of trucks; promoting uniformity in state tax procedures; and, limiting the sheer number and variety of taxes

imposed on trucks.

More efficient vehicles should be allowed to operate on the nation's highways.

Any increase in highway user fees should be preceded by drawing down the surplus in the Highway Trust Fund, a commitment to use highway taxes for highway purposes, and uniformity in state regulations.

Statement of

CHARLES F. FLOYD, AICP

on behalf of the

AMERICAN PLANNING ASSOCIATION

before a hearing of the

SURFACE TRANSPORTATION SUBCOMMITTEE

of the

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

U.S. HOUSE OF REPRESENTATIVES

on

THE HIGHWAY BEAUTIFICATION ACT AND
ITS IMPACT ON PLANNING

March 15, 1990

Chairman Mineta and Members of the House Surface Transportation Subcommittee: I am Charles F. Floyd, AICP, Professor of Real Estate at The University of Georgia's College of Business Administration.

Over the past two decades I have been closely involved with the issue of highway beautification. I served on the U.S. Department of Transportation's National Committee on Outdoor Advertising and Motorist Information, and also on a similar Georgia Department of Transportation committee. Several years ago I co-authored a book on the Highway Beautification Act, and I have written a number of articles related to this topic. I have also served as an expert witness on highway beautification-related issues for the Federal Highway Administration, several states, and a number of local governments.

I am pleased to be testifying on the subject of billboard controls on behalf of the American Planning Association and I respectfully request that the complete text of my statement be included in the official hearing record.

The American Planning Association (APA) is a national organization of 25,000 members, including public and private planners and elected and appointed officials at all levels of government as well as educators, students and interested

citizens. Our members belong to 45 chapters covering every state and Congressional district.

APA was formed in 1978 when the American Institute of Planners, established in 1917, and the American Society of Planning Officials, founded in 1934, were consolidated. The Association's primary objective is to advance the art and science of planning for the improved development of the nation and its communities, states and regions, as well as to preserve its valuable natural resources. Within APA is the American Institute of Certified Planners (AICP) which focuses on professional development, and of which I am a member.

Members of AICP are distinguished by having met experience requirements and having passed an examination on planning principles and practices.

THE HIGHWAY BEAUTIFICATION ACT IS A FAILURE

The Highway Beautification Act is an almost total failure. In fact, it is difficult to imagine how the program could be made more ineffective in achieving its original stated objectives, be more perverted to benefit the supposedly regulated outdoor advertising industry, or be modified to more greatly hinder the efforts of state and local governments to clean up billboard blight in their communities.

The Inspector General and General Accounting Office Reports

I am not asking you to just accept my views on this matter, but to also look at reports from the General Accounting Office and the Secretary of Transportation's Inspector General. The Inspector General concluded:

> The Outdoor Advertising Control Program has been ineffective in improving highway beautification as the number of signs located adjacent to the nation's highways continues to increase. This condition is attributed to weaknesses in the Federal program legislation and state enforcement of sign control regulations. As a result, program expenditures of about $21 million in Federal Highway Administration (FHWA) Region 4 and $197 million nationwide have had little impact on enhancing the scenic and recreational value of highways.

The GAO report came to similar conclusions. It pointed out that in 1983, 2,235 nonconforming signs were removed; that same year, 13,522 permits were issued for new billboards in zoned or unzoned commercial areas. Since up to four billboard faces can be erected at each permitted site, the number of new faces was at least 25,000 to 30,000. Also, the new signs going up typically

have been much, much larger than the nonconforming signs that were removed. In summary, counter to expectations when the Highway Beautification Act was passed, there are more and bigger billboards on the rural highways of almost all states than there were twenty-five years ago.

WHY DOES THE OUTDOOR ADVERTISING INDUSTRY LOVE THE HIGHWAY BEAUTIFICATION ACT?

The definitive word on the effectiveness of the highway beautification program comes from the outdoor advertising industry itself. They like it! A recent press release from the Outdoor Advertising Association of America praised the Act as: "The Highway Beautification Act: A Law That Works!" They applauded its supposed virtues, rapturously extolling: "Taxpayers can only dream that every law that Congress passes works as well as the 1965 Highway Beautification Act."

Because it is obvious that if the Act were achieving its stated objectives, the billboard lobby would not be praising it, one must ask the obvious question: Why does the outdoor advertising industry love the Highway Beautification Act?

The explanation is simple. The program has been ineffective both in (1) preventing the spread of billboard blight in areas it was supposed to protect, and (2) in removing existing billboards

in these areas. The law contained fatal defects when it was passed, Congress has further weakened it with subsequent amendments, and the Federal Highway Administration (FHWA) has almost completely abdicated its enforcement responsibilities. The FHWA has discontinued any compliance reviews of state programs and has failed to take corrective action even when documentation of flagrant violations is presented to them.

Loopholes Permit New Billboards in Protected Areas

The Highway Beautification Act was supposed to permit new billboards only in areas where there were actual commercial or industrial uses. One need only to travel the nation's highways to observe that the Act has not accomplished this objective. Today thousands of billboards can be found in wetlands, woodlands, and farmlands, on open prairies, mountain meadows, even in the middle of the desert--in many cases, miles from the nearest exit, town, or building--and certainly not in areas of actual commercial or industrial use.

Why have these new billboards been permitted? First, many communities, particularly rural counties, have "phony zoned" long stretches of rural roads as commercial or industrial areas, thereby permitting the erection of thousands of billboards in totally rural areas where scenic beauty was supposed to be protected by the Act.

Second, under the gaping "unzoned community or industrial area" exception, all an outdoor advertising firm needs in order to secure a permit to put up a new billboard in unzoned areas is to find, or even build, some obscure community or industrial activity--perhaps a utility shed, a small beauty shop, a country store or a campground, that happens to be located near a "protected" highway.

The law also has failed to control the size or height of new billboards. A 1966 inventory of existing billboards revealed that only 1.8 percent of the signs had faces as large as 600 square feet. Despite this, the "beautification" agreements with most of the states allow sign faces on new billboards of up to 1,200 square feet, and do not limit the height of new billboards at all.

VEGETATION DESTRUCTION

Perhaps the ultimate perversion of the beautification program is its use as a justification for destroying trees on the public right-of-way that block a clear view of billboards. In 1977, the billboard industry persuaded the Federal Highway Administration to legalize this vandalism of the public's property by reclassifying it as "vegetation control." Not only has this tree destruction destroyed hundreds of thousands of

publicly owned trees, but the Inspector General and General Accounting Office reports concluded that the policy had also hindered the removal program by giving thousands of nonconforming billboards new life; otherwise the signs would have been abandoned because they would have been obscured by vegetation growth. Even so, the FHWA has refused to change the policy.

THE FAILURE OF THE REMOVAL PROGRAM

Communities have traditionally cleaned up billboard pollution by requiring that nonconforming signs be removed after a period of years, a process generally known as amortization. Almost all courts have held this to be adequate and fair compensation, particularly since the offending billboards remain the property of the outdoor advertising company and can be moved to other more appropriate locations. Nevertheless, unlike other nonconforming uses, the Highway Beautification Act requires taxpayers to pay cash compensation for all signs removed along the "protected" federal highways. This is the only federal environmental program that allows polluters to continue polluting until they are paid to stop polluting.

The greatest triumph for the billboard industry has been to use the cash payment requirement to deny state and local governments their traditional right to force the removal of nonconforming signs through the use of their regulatory powers.

Nonconforming billboards located on Interstate or Federal-aid primary highways are protected from removal by the Highway Beautification Act. Thus, the billboard polluters are protected from local regulation by the supposed anti-pollution legislation.

A COMPARISON WITH THE CLEAN AIR ACT

Suppose that the Congress wanted to amend the Clean Air Act to make it as ineffectual in achieving its stated objectives as the Highway Beautification Act is in achieving its stated objectives. First, it would be necessary to conduct an inventory of existing air pollution sources. The standard for new plants would then be set at twice the pollution level found at the worst existing one. New plants would be permitted anywhere the land was zoned commercial or industrial, or where there was any type of existing commercial or industrial polluting source, even a country store which burned its trash out back.

Existing polluters would not be required to reduce their emission levels until they were paid to do so, and mandatory compensation levels would be set far in excess of original investments. Of course, Congress would not appropriate any money for the clean-up program, but at the same time would prohibit states and local governments from using their constitutional police powers to force polluters to reduce their emissions.

I am certain you will agree that such a program would be totally ineffective in improving the quality of the nation's air. In fact, of course, it would result in even more pollution than exists today.

I am certain you will also agree that even to suggest that the Clean Air Act be amended in this way would be totally ludicrous--and you would be correct. Unfortunately, however, this absurdity is a valid analogy to the current Highway Beautification Act.

SUMMARY AND CONCLUSIONS: THE PLANNERS' PERSPECTIVE

In recent years planners have identified sign control as one of the most important yet troublesome problems facing local governments. Most communities distinguish between on-premise signs (which advertise goods or services sold on the site where the sign is located) and off-premise signs or billboards.

Many local governments have decided that billboard controls are necessary to protect and preserve the beauty, character, economic and aesthetic value of land and to protect the safety, welfare and public health of their citizens. Over the past several years, more than 500 cities and counties have enacted new regulations to control billboards. Yet many communities find it

impossible to enforce their billboard ordinances because of the Federal Highway Beautification Act.

As previously mentioned, the Federal Act requires the states to control billboards adjacent to primary and interstate highways that receive Federal aid, including Federal highways located within cities and other local governments. All states have legislation that implements the Federal Act. The Act imposes penalties on states that do not meet Federal standards. States that do not comply with Federal standards may lose 10 percent of their Federal highway funds.

Unfortunately, in 1978 Congress adopted an amendment to the Act which ties the hands of local governments that want to remove nonconforming billboards along Federal highways under state or local law. Before the amendment was adopted, local governments could remove nonconforming billboards along Federal highways through amortization under state and local police powers without paying public monies. The Act now requires local governments to pay billboard owners before a nonconforming billboard can be removed.

The Federal government is supposed to meet 75 percent of the cost of billboard removal, but Congress has not appropriated funds for this purpose since 1982. This is a major obstacle to billboard regulation because the removal of nonconforming

billboards is essential to an effective billboard control program.

As a result, local governments and planners face a "Catch 22" situation. They are told nonconforming billboards cannot be removed unless public monies are paid, but no federal funds are available for this purpose. At the same time, new billboards continue to go up on many of the very same roads where the industry insists on being paid to remove other billboards. As we have said, the U.S. General Accounting Office and the Inspector General of the U.S. Department of Transportation both concluded that the law has not halted the proliferation of new billboards along Federal highways.

RECOMMENDATIONS

What can be done to rescue the Highway Beautification Act and enable it to achieve its original stated objectives?

First, the provisions of the existing law should be enforced, and the policy of permitting trees on the right-of-way to be destroyed should be changed.

Second, new billboards should be permitted only where genuine and extensive commercial or industrial land use currently exists. They should be specifically prohibited in areas where

they are not permitted by local ordinance. If permitted by local jurisdictions, they should be forced to comply with local size and height requirements.

Third, Federal legislation should be enacted that restores to local governments the authority to remove billboards through amortization under local law through land use powers as defined by state constitutions.

Fourth, the authority of local governments to require nonconforming signs along Federal highways to comply with size and height requirements without cash payments, should be affirmed.

Fifth, Federal, state and local legislation should be amended to require the removal of billboards in inappropriate locations especially in rural, scenic, historic and residential areas.

Sixth, state legislation and local ordinances halting the construction of new billboards should be adopted until the Federal government either appropriates sufficient funds to remove nonconforming billboards or restores the authority of local governments to remove billboards through amortization without cash payments.

Seventh, standard signage requirements (logo-type signs) should be adopted on rural interstate, U.S. and state highways which provide service information.

Let me conclude by thanking the Chairman for providing me and the American Planning Association with this opportunity to testify on this issue of such great importance to our members. I will be happy to entertain any questions.

38-253 O—91——29

Testimony of

William J. Grayson, Jr.

Chairman, National Stone Association

Presented To

The Subcommittee On Surface Transportation

Of The

U.S. House of Representatives

On The Topic Of

The Reauthorization Of The Post-Interstate

Surface Transportation Programs

I am William J. Grayson, Jr., Executive Vice President of the Vulcan Materials Company and Chairman of the National Stone Association.

The National Stone Association represents 461 firms that produce crushed stone or manufacture equipment used in such operations. The crushed stone produced by NSA members is a basic material used in building our nation's highways, airports and other vital components of our infrastructure. A substantial portion of the crushed stone produced by our members is also used for agricultural and chemical purposes, erosion and sedimentation control, railroad ballast and environmental projects. Stone is indeed a unique and fundamental national resource.

Mr. Chairman, I would like to take this opportunity on behalf of NSA's entire membership to commend this Subcommittee for the leadership it has shown in forcefully advocating the need to improve the roads and bridges that constitute the Federal-Aid Highway System. It has not been an easy task, especially in a time when budgetary concerns loom large over domestic programs, but it is clear that without such leadership the prospects for devising an efficient federal highway system in the post-1991 period would certainly be less bright.

Mr. Chairman, I am well aware that the Subcommittee has a tight schedule, so I will keep my comments and suggestions brief and to the point.

I. The Highway Capacity Crunch: What the U.S. Must Do To Meet Demand In The Post-1991 Period

A. Projected needs

Mr. Chairman, the American Association of State Highway and Transportation Officials' (AASHTO) excellent report, New Transportation Concepts For A New Century, states that in 1988 "Americans traveled two trillion vehicle miles by auto, truck, bus and public transit, more than triple the travel mileage of 1956, when the Interstate and Defense Highway System was begun." As further noted in the report, the total travel by these modes of transportation will double by the year 2020. If the report makes one thing perfectly clear, it is this: the $66 billion spent in 1987 by local, state and federal governments will no longer be sufficient if we are to make a serious effort to remain competitive in the global market.

Mr. Chairman, Americans are blessed with a built-in competitive advantage that exists in no other market of our size. In contrast to Europe, for example, we have one currency, one language, and what up to now has been a transportation system that has been the envy of the world. I for one, would hate to see the deterioration of this last component be the thing that makes us lose our competitive edge.

The basic objectives of the Federal-Aid Highway Program were to provide users of the highway system access to trade and travel opportunities. For the most part, this has been accomplished through the development of the interstate, primary, secondary

and urban systems, and other programs that foster highway safety, bridge improvements, and research and development. Congress further envisioned that the interstate system would be completed in 1991 and anticipated no further funding for additional construction beyond that year.

Yet the AASHTO report cited above and other studies have shown that segments of the interstate and primary systems have reached the end of their design life and must now be replaced. Urban congestion, deteriorating and inadequate bridges, and the need for additional capacity in both urban and rural areas warrant continued federal support of our nation's highway and bridge network. In fact, this was brought home to me recently when I learned that the Federal Highway Administration has rated 60 percent of our roads as substandard and 42 percent of our bridges as structurally deficient or functionally obsolete.

B. Recommended Funding Levels

Making the system functional and making the system adequate will require a guaranteed source of funding such as that provided by the Highway Trust Fund. Much of this can be readily accomplished. For example, I believe the Highway Trust Fund should be drawn down to the extent permitted by law to meet demonstrated needs and protect public safety. Although this will not take the place of additional revenue needs in excess of the federal spending levels of $13 to $13.5 billion per year, it would be an important first step in ensuring that needed improvements can be made. Unfortunately, there is currently an unexpended $10.248 billion balance in dedicated user-fees being held hostage in the highway account of the Highway Trust Fund. This continuing buildup of $1 to $2 billion per year in unspent trust fund balances is simply without justification in view of the documented needs for road and bridge construction and

repairs. To this end, I would note that AASHTO recently recommended increasing the annual federal highway program funding levels from $18 to $26 billion over the life of the next highway program. Mr. Chairman, NSA wholeheartedly supports AASHTO's recommended funding levels for the post-1991 federal highway program and believes, as does AASHTO, that these recommended funding levels represent a conservative estimate of the amounts needed to fund the documented needs. I would also add that the overall annual investment by federal, state and local entities in highway construction and maintenance must achieve the $100 billion per year level widely recognized as the minimum future program necessary for the country.

II. NSA's Recommendations For Obtaining Required Funding For The Federal Highway Program

In addition to drawing down the Highway Trust Fund balance, it is clear that additional funding will be required to meet the projected need for capital improvements and repairs. To this end, we believe that a significant increase in the motor fuels user fee is warranted in order to finance these improvements. We are firmly convinced that the users of our highway system are willing to accept higher user-fees in return for an adequate system that will enable us to be fully competitive in the world market. In fact, at the 1989 meeting of the U.S. Chamber of Commerce, more than 80 percent of the participants stated that they would support higher user-fees if they were earmarked for transportation improvements.

NSA also believes the current six-cent-per-gallon federal excise tax exemption for gasohol fuels should be eliminated. According to the Federal Highway Administration, this tax exemption costs the Highway Trust Fund more than $500 million annually, even though vehicles powered by alternative fuels inflict the same damage on roadways as

vehicles using gasoline. In light of legislative proposals pending before Congress that would mandate the use of alternate fuels in certain areas, it is essential that this tax subsidy should be repealed in order to avoid a further drain on highway funding. If it is the wish of Congress to provide this exemption, it should come from general fund revenues and not from dedicated highway user fees.

III. Preserving The Dedicated User-Fee Financing Mechanism

The unexpended total of the highway account of the Highway Trust Fund balance now exceeds $10.248 billion, all of it in gasoline tax revenues and other use fees that you and I and every motorist paid for the privilege of driving over our roads and bridges.

The dollars are piling up and being held hostage because the trust fund remains a part of the federal unified budget. To spend them would, in effect, make the federal deficit appear greater than it is now, just as not spending the money makes the deficit appear smaller than it is.

That is an illusion, and nothing more.

Our federal budget deficit is a major problem, but we must call a halt to this acrobatic accounting process when it comes to the Highway Trust Fund. We must insist that your dollars, my dollars, and those of every American motorist, be spent on fixing up our roads and bridges -- in the name of mobility, safety and economic well-being.

NSA therefore believes that the Highway Trust Fund should be removed from the federal unified budget and that the programs financed by the fund should be exempt from any across-the-board spending cuts required under the Balanced Budget and Emergency Deficit Control Act of 1985.

We also believe that highway projects should not be put on hold because of policies concerning air quality, speed limits and other matters that have no material connection to the program. Moreover, we recommend that Congress abolish the use of obligation limitations or ceilings, which serve no purpose other than to artificially limit the availability of funds for much-needed road and bridge projects by indirectly controlling the level of cash outlays. In fact, I fail to comprehend why the funding for FY91 is not based on expected user-fee revenues in that year which are projected to exceed $15 billion.

IV. The Department of Transportation's National Transportation Policy and Strategies for Action

Mr. Chairman, NSA applauds the initiative taken by the Administration in developing a comprehensive proposal which recognizes the pressing need to revitalize the nation's transportation infrastructure. As the drafters of the DOT report, Moving America, so eloquently state:

> the Nation's vitality has always been linked to mobility . . . Transportation is an engine for economic growth and a link between the regions and the businesses and the people of the Nation and the world. Americans have moved farther, gone faster, and made more progress as a nation than any other society in history. As we enter the 21st century, our transportation system, the symbol of that movement, will drive our growth . . . and signal our success in forging solutions to the social and economic challenges we face . . . transportation will be tomorrow --as it has always been in the past -- integral not only to the way we live but also to building a better America for the future.

Mr. Chairman, DOT's report clearly makes the case for revitalizing the nation's ailing transportation infrastructure, however, I am sad to say that it does not provide the federal leadership required to provide the wherewithal for meeting its stated goals and objectives. This is all the more disappointing because it fails to recommend an immediate spend down of the sizeable balance in the Highway Trust Fund and match obligation levels to projected revenue in order to allow much-needed road and bridge projects to go forward. We hope everyone will soon come to the full realization that the post-1991 Federal-Aid Highway Program must be adequately financed -- even if it means upsetting those architects of the unified budget who would rather have the Highway Trust Fund be used to mask the federal deficit than allow it to be used to finance the very projects that ultimately can only serve to promote the continued growth of the nation's economy.

The bottom line is that with our overwhelming road and bridge improvement needs, we can no longer ignore the fact that we must spend the dedicated user-fees that have been collected for this purpose, increase revenue to meet those needs, and put aside any thought of continuing to subsidize extraneous programs, such as the exemption provided for gasohol.

Mr. Chairman, this concludes my remarks. Thank you for this opportunity to appear before you. I will be pleased to answer any questions that you and the other members of the Subcommittee may have.

Executive Summary

The National Stone Association respectfully recommends that Congress:

1. draw down the $10.248 billion balance in the Highway Trust Fund to the extent permitted under present law;

2. eliminate the use of limitations on obligations, which serve no purpose other than to artificially reduce highway spending;

3. increase the annual federal highway program funding levels from $18 billion to $26 billion by the mid 1990's, as recommended by the American Association of State Highway and Transportation Officials;

4. increase motor fuel user fees to appropriately finance much-needed road and bridge construction and repairs;

5. eliminate the inequitable tax subsidy of gasohol; and

6. remove the Highway Trust Fund from the federal unified budget and exempt the programs financed by the fund from any across-the-board cutbacks in spending required under the Balanced Budget and Emergency Deficit Control Act of 1985.

TESTIMONY
BEFORE THE
SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE
HOUSE PUBLIC WORKS COMMITTEE
THURSDAY, MARCH 15, 1990
ROOM 2167 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC

BY
JOSEPH P. KIRK
EXECUTIVE DIRECTOR
MON VALLEY PROGRESS COUNCIL
EASTGATE ELEVEN
MONESSEN, PA
(412) 684-3381
AND CHAIRMAN
MON/FAYETTE EXPRESSWAY ASSOCIATION

MR. CHAIRMAN AND MEMBERS OF THE SURFACE TRANSPORTATION SUBCOMMITTEE OF THE HOUSE PUBLIC WORKS COMMITTEE, MY NAME IS JOSEPH KIRK. I AM EXECUTIVE DIRECTOR OF A CORPORATE SPONSORED, COMMUNITY AND ECONOMIC DEVELOPMENT NOT FOR PROFIT CORPORATION CALLED THE MON VALLEY PROGRESS COUNCIL AND CHAIRMAN OF THE MON/FAYETTE EXPRESSWAY ASSOCIATION. THE PROGRESS COUNCIL, WHICH IS CELEBRATING IT'S 25TH ANNIVERSARY, SERVES A REGION LOCATED TWENTY-FIVE MILES SOUTH OF THE CITY OF PITTSBURGH. THE MON/FAYETTE EXPRESSWAY ASSOCIATION IS A COALITION OF LOCAL LEADERS COMMITTED TO THE TIMELY DEVELOPMENT OF THE EXPRESSWAY PROJECT. AN ATTACHED MAP PROVIDES THE SERVICE AREA OF THE PROGRESS COUNCIL AND THE LOCATION OF THE MON VALLEY/FAYETTE EXPRESSWAY.

IT IS A PLEASURE TO HAVE THE OPPORTUNITY TO APPEAR BEFORE THIS COMMITTEE ON AN ISSUE OF SUCH PROFOUND IMPORTANCE AS HIGHWAY DEVELOPMENT.

AS MEMBERS OF A COMMITTEE THAT DEAL WITH IMPORTANT ISSUES OF TRANSPORTATION, YOU ARE ACUTELY AWARE OF THE DIRECT RELATIONSHIP BETWEEN ECONOMIC VIABILITY AND THE AVAILABILITY OF A MODERN

HIGHWAY SYSTEM. IN ECONOMIC DEVELOPMENT EFFORTS, THE PRESENCE OF HIGHWAY SYSTEMS THAT PROVIDE ACCESS TO MARKETS IS A PREREQUISITE FOR THE LOCATION OF INDUSTRY.

FOR THE MON VALLEY REGION, THE DEVELOPMENT OF A NEW HIGHWAY LINK IS ESSENTIAL FOR THE ECONOMIC REVITALIZATION OF OUR REGION. THE DEVASTATING INDUSTRIAL DECLINE OF OUR REGION IN THE 1980'S IS WIDELY KNOWN. ALTHOUGH PROGRESS HAS BEEN MADE IN PROVIDING EMPLOYMENT FOR THE 100,000 PEOPLE WHO LOST JOBS, UNEMPLOYMENT IN THE STEEL VALLEY COMMUNITIES STILL IS IN THE DOUBLE DIGIT RANGE.

DESPITE A DEEP COMMITMENT TO OUR OWN HIGHWAY PROJECT, MY PURPOSE IN APPEARING BEFORE THIS COMMITTEE IS TO SPEAK TO A MUCH BROADER HIGHWAY DEVELOPMENT ISSUE. THE 1987 SURFACE TRANSPORTATION ACT TOLL ROAD PROVISION DEVELOPED UNDER THE LEADERSHIP OF THIS COMMITTEE SET INTO MOTION A POLICY THAT CAN HAVE A PROFOUND IMPACT ON THE DEVELOPMENT OF NECESSARY ECONOMIC DEVELOPMENT HIGHWAYS SUCH AS THE MON VALLEY/FAYETTE EXPRESSWAY. THE RECENTLY ISSUED NATIONAL TRANSPORTATION POLICY REPORT SPEAKS OF THIS ON PAGE 118 BY STATING THAT THE ADMINISTRATION WILL DEVELOP LEGISLATION CONSISTENT WITH THE PRINCIPLE TO "ALLOW GREATER USE

OF TOLL FINANCING ON FEDERAL AID HIGHWAYS". TESTIMONY PROVIDED BY SOUTHWESTERN PENNSYLVANIA AND WEST VIRGINIA GROUPS AT HEARINGS IN THE DEVELOPMENT OF THIS POLICY IS CITED ON PAGE 25 OF THE REPORT.

IN OUR EFFORTS TO ENCOURAGE THE NEXT STEP IN THE PROMOTION OF TOLL ROADS WE HAVE CONSULTED WITH A VARIETY OF HIGHWAY USER GROUPS, ELECTED OFFICIALS AND CONSTRUCTION ASSOCIATIONS INCLUDING THE INTERNATIONAL BRIDGE, TUNNEL AND TURNPIKE ASSOCIATION, THE AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION, ASSOCIATED BUILDERS AND CONTRACTORS, CONTRACTORS ASSOCIATION OF WESTERN PENNSYLVANIA AND AMERICAN TRUCKING ASSOCIATION, INC. I AM NOT SUGGESTING THAT WE ARE REPRESENTING A POLICY POSITION OF THESE GROUPS. HOWEVER, IT IS FAIR TO REPORT THAT OUR PROPOSAL HAS EARNED THE INTEREST OF THE AFOREMENTIONED.

OUR PROPOSAL TO PROMOTE NEW ECONOMIC DEVELOPMENT HIGHWAY LINKS IS BASED ON THREE PRINCIPLES.

* A LIMITED FEDERAL TOLL ROAD STRATEGY ENHANCES THE OPPORTUNITY TO DEVELOP PRIORITY ECONOMIC DEVELOPMENT LINKS.

* THE FEDERAL HIGHWAY ADMINISTRATION SHOULD PLAY AN ACTIVE ROLE IN DIRECTING THE DEVELOPMENT OF SUCH ROADS CONSISTENT WITH THE PROVISIONS OF THE 1987 ACT.
* THE 1991 REAUTHORIZATION OF THE SURFACE TRANSPORTATION ACT SHOULD INCLUDE SPECIFIC, DIRECT FINANCIAL SUPPORT FOR THE IMPLEMENTATION OF A TOLL ROAD POLICY.

GENTLEMEN, WHAT WE ARE PROPOSING IS A TARGETED FEDERAL INITIATIVE TO PROMOTE THE DEVELOPMENT OF IMPORTANT NEW HIGHWAY LINKS CONSISTENT WITH THE NATIONAL POLICY REPORT OBJECTIVE OF "INCREASING THE SHARE OF FEDERAL AID FOR TRANSPORTATION" (PAGE 44). THE PRIORITY HIGHWAY LINK PROGRAM WE PROPOSE WOULD BE TARGETED TO THE CONSTRUCTION OF NEW LIMITED ACCESS INTERSTATE GRADE HIGHWAYS. ATTACHED TO MY TESTIMONY IS A COPY OF THE DETAILS OF OUR PROPOSAL.

IF IMPLEMENTED THE PROPOSAL WOULD PROVIDE DIRECT FEDERAL SUPPORT FOR 75% OF THE 35% FEDERAL AID APPROVED UNDER THE TOLL ROAD PROVISION OF THE 1987 ACT. THIS WOULD REPRESENT 26% DIRECT FEDERAL ASSISTANCE FOR PRIORITY HIGHWAY LINKS. THE 9% DIFFERENCE WOULD BE SUPPORTED THROUGH EXISTING HIGHWAY TRUST FUND

APPROPRIATIONS TO THE STATES. FUNDING FOR THIS INITIATIVE COULD BE SUPPORTED BY AN INCREASE IN THE AUTHORIZED LEVEL OF THE FEDERAL HIGHWAY TRUST FUND. THE AMOUNT OF THE INCREASE WOULD BE BASED ON THE FINANCIAL NEEDS OF SUCH PROJECTS AND REFLECTIVE OF FISCAL REALITIES. EACH STATE WOULD BE PERMITTED TO SEEK DESIGNATION FOR ONE TOLL ROAD UNDER THE PROGRAM. FUNDS WOULD BE ALLOCATED ON A COMPETITIVE BASIS.

ALTHOUGH WE FEEL THAT A TOLL ROAD STRATEGY IS THE MOST EFFECTIVE MEANS TO DEVELOP ECONOMIC DEVELOPMENT HIGHWAY LINKS, CONSIDERATION SHOULD BE GIVEN TO BROADEN THE PARTICIPATION THAT WOULD PERMIT OTHER INNOVATIVE PUBLIC/PRIVATE FINANCING TECHNIQUES. THE USE OF SUCH INNOVATIVE TECHNIQUES IS REPEATEDLY REFERRED TO IN THE NATIONAL POLICY REPORT.

FOR OUR REGION THE PRIORITY HIGHWAY LINK PROGRAM WOULD PROVIDE A MEANS TO ENSURE THE TIMELY COMPLETION OF THE MON VALLEY/FAYETTE EXPRESSWAY. ON A NATIONAL LEVEL THE PROPOSAL WOULD PLACE THE FEDERAL GOVERNMENT IN A LEADING ROLE FOR THE IMPLEMENTATION OF INNOVATIVE TECHNIQUES THAT PROMOTE A WIDE RANGE

OF FINANCING STRATEGIES NECESSARY FOR THE DEVELOPMENT OF NEW HIGHWAYS.

AGAIN, I THANK YOU AND WELCOME YOUR QUESTIONS.

Proposed
Federal Toll Road Initiative
for the 1990's

The establishment of the Toll Road Demonstration Program under the 1987 Surface Transportation Act represented a significant milestone in the promotion of toll road facilities. The seven states designated under the program (later expanded to nine) were permitted for the first time to utilize Federal Highway funds for up to 35% of the cost of one toll road project per state designated by the Governor. Projects were also approved by the Federal Highway Administration.

Policy established through the 1987 Act clearly recognized the importance of toll road facilities in meeting the need for new highways. The 35% funding formula established under the Act also began the transition of the Federal Government to a partnership role on certain highway projects. Conversely this formula requires significant financial participation from states, local governments and the private sector to advance such projects.

Although the 1987 Act established an important policy it fell far short of the mark in the provision of fiscal resources necessary for implementation. The Act created a process where newly established projects have to complete with long term needs in an environment of inadequate fiscal resources. A paper tiger policy will not promote the development of highways essential for relief of congestion, promotion of safety and the provision of essential catalysts for economic development and redevelopment.

Pending legislative action on the renewal of the Federal Highway Program provides an opportune time to develop a truly effective program to promote toll road facilities. The elements outlined below would provide a targeted and measured approach that could be incorporated into the 1992 Surface Transportation Act. The proposed increase in the authorized level of Federal Highway Trust Funds stated below would support toll road projects. The proposed funding formula of 26% would result in a funding ratio of almost 4 to 1 versus current ratios of as low as 1 to 9. As an example, a 500,000 million dollar highway project would require $270,000 less in Federal funds under the proposed toll road initiative.

Proposed Toll Road Initiative

* Expansion of the 1987 Toll Road Provisions to include one project in each of the fifty states.

* Continuation of the process for designation of toll roads established under the 1987 Act.

* Establishment of a funding formula based on 75% of the 35% eligible costs of toll road projects. The program would be supported by an increase in the authorization level of the Federal Highway Trust Fund.

* It is anticipated that the increase in the authorized level would be inadequate to support all projects seeking funding. A task force of toll road agencies would be established to develop a draft criteria for selection of projects and submit their findings to the Secretary of Transportation. Projects would be submitted to the Federal Highway Administration for review and approval.

Testimony of

SCENIC AMERICA

Presented by

Edward T. McMahon
Executive Director

March 15, 1990

HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE
SURFACE TRANSPORTATION SUBCOMITTEE

Mr. Chairman and Members of the Subcommittee, good afternoon. My name is Ed McMahon. I am the Executive Director of Scenic America, a national conservation organization dedicated to the protection of America's scenic and unique landscapes, roadways, cities and towns. I respectfully request that the complete text of my statement and the attached special report on the Highway Beautification Act be included in the official hearing record.

I am here today to testify on the need to reform the 1965 Highway Beautification Act (HBA). This law was passed to promote "safety and recreational value of public travel and to preserve natural beauty." Twenty five years after passage of the HBA, due to inherent flaws and subsequent weakening amendments, the act is not working and is badly in need of change.

Members of the Committee may recall that the House of Representatives voted in favor of change back in 1986 and 1987 during the last highway re-authorization debate. Though supported by a majority of the Congress, strengthening amendments to the HBA including a cap on new billboards were removed during final conference on the 1987 Highway Bill. Today, we strongly urge the

Committee to either include HBA reform in the 1990 Highway Reauthorization Act, or to pass H.R. 3389, the Billboard Control Act of 1989 introduced by Rep. John Lewis and now pending before this committee.

Without reform of the HBA, America's scenic resources will continue to deteriorate. Without reform, America's traveling public will continue to be bombarded by visual blight and information overload. Without reform, America's merchants will be denied less expensive alternative forms of motorist information. Without reform, the trees lining America's scenic roadways will continue to be destroyed for the sole purpose of enhancing billboard visibility. Without reform, American taxpayers face a lien on the federal treasury that now exceeds one billion dollars. Without reform, America's states and cities will be forced to pay billboard companies millions of dollars of taxpayer money while a cheaper and constitutionally sanctioned alternative exists. Without reform, this Committee will deny the dream articulated by Lady Bird Johnson and patiently awaited by millions of Americans.

But the patience of many Americans is wearing thin. Today newspapers are full of stories about citizens in New York, Detroit and Chicago and hundreds of other cities who are protesting the proliferation of billboards. For example, voters in Jacksonville, Florida; Tucson, Arizona, and Beaufort County, South Carolina have all recently endorsed ballot referendums which ban new billboards and require existing billboards on non-federal highways to be removed.

LOOPHOLES IN THE LAW

Today, the HBA permits new billboards to be erected virtually everywhere including in totally rural countryside, inside national historic districts, next to our national parks, even adjacent to schools and churches.

In 1984, the Inspector General of the U.S. Department of Transportation reported that between 1979-1984, taxpayers paid to remove 1,957 nonconforming billboards along federal highways in Florida. During the same period 8,218 new billboards were erected, resulting in a net gain of 6,251 billboards. 1

Likewise, the Michigan Department of Transportaion reports between 1972-1988 it paid to remove 6,099 nonconforming billboards but during the same period 13,150 new so-called "conforming" billboards were erected. 2

Similiarly, a 1989 University of Florida study showed that motorists driving on I-75 through largely rural Marion County, Florida would see 340 billboards in one 40 mile stretch -- roughly one billboard every seven seconds.3

Why are new billboards going up along our supposedly protected rural highways? Because the HBA is filled with loopholes and exceptions. These exceptions have swallowed the rule. For example, many communities have stripped zoned long stretches of rural roads as phony "commercial" and "industrial" zones, thereby permitting the erection of numerous billboards in totally rural areas where scenic resources were supposed to be protected.

Another loophole, known as the "unzoned commercial or

industrial area" exception, allows billboard companies to erect new billboards in rural unzoned areas if there is any obscure commercial or industrial activity. It doesn't matter if the activity is readily visible from the highway. And most often these new billboards advertise products that have nothing to do with the unzoned commercial activity.

In fact, Advertising Age magazine reports that 8 out of the top 10 billboard advertisers promote cigarettes or liquor. (see the attached) What's more, there are numerous ways to provide motorists with information along our highways. These include logo signs, low-frequency radio, rest stop advertising, and other non-polluting alternatives to billboards. Indeed, the new National Transportation Policy makes it federal policy to "promote standardized signs and increased information for travelers, particularly along... scenic highways and other passenger routes".

SIZE, HEIGHT AND SPACING

The law has also failed to control the size or height of billboards. The HBA does not limit the height of billboards along federal highways and it allows billboards up to 1,200 sq. feet in rural areas and 3,000 sq. feet in urban areas. As a point of perspective, the typical billboard in 1965 was only 300 square feet in size and it sat on the ground.

The spacing in the current law is also unreasonably permissive. It permits up to 20 new billboards per mile along Interstates, up to 34 billboards per mile on primary highways in rural areas and up to 104 billboards per mile on primary roads inside cities. It even allows new billboards to be built in

national historic districts and at the gateways to our local, state and national parks.

To add insult to injury, the billboard industry has erectd thousands of new billboards in minority and low-income neighborhoods -- the largest number advertising cigarettes and alcoholic beverages. Surveys (see the attached) in Baltimore, Detroit, New Orleans, Washington, D.C., St. Louis, San Francisco, and Atlanta document that there are more billboards in black neighborhoods than comparable white neighborhoods with a higher percentage of alcohol and tobacco ads in black neighborhoods, than elsewhere.

ABUSES IN THE REMOVAL PROGRAM

While the law is overly permissive with respect to the construction on new billboards it is overly restrictive with respect to the removal of nonconforming billboards.

Scenic America recognizes the need for equitable measures to remove billboards. Unfortunately, Congress has saddled the states and local communities with the single least equitable and most expensive form of billboard clean-up.

Today, the law requires taxpayers to pay cash for the removal of all nonconforming billboards. Ironically, no money has been appropriated for billboard removal since 1982. As a result, today cities are told they can not remove billboards unless they pay taxpayers dollars (75% federal 25% state) to remove them, yet no money is available for this purpose.

The law also takes away the power of local governments to use their own local land use powers. Because of the 1978 amendment to

the act, communities which use their own land use authority to require the removal of billboards over time -- a practice called amortization -- now run the risk of losing up to 10% of their federal highway construction funds.

No other industry in America receives this special protection under the law. No other industry in America is exempt from amortization. Under the current law, a local community can amortize junkyards along its freeways, but not billboards.

Today, 25 years after passage of the HBA almost 100,000 nonconforming billboards remain. Last year only 385 were removed. For all practical purposes there is now no federal billboard removal program.

In 1985 the U.S. General Accounting Office declared that "accomplishing the goal of the Highway Beautification Act will require either additional federal funding or a change in the compensation requirement of the act." 4

We agree with the General Accounting Office: either appropriate money for billboard removal, or restore local governments ability to use their own local land use powers.

Nonconforming signs are a local problem to be solved through local law under land use powers defined by state constitutions. If a city wants to be overrun with billboards, so be it. But if a city wants to remove nonconforming billboards, the federal government should not prevent them from doing this.

Communities have traditionally cleaned up billboard pollution by requiring that nonconforming signs be removed after a period of years. Almost all courts have held this to be adequate and fair

compensation for sign owners, particularly because the offending signs can be moved to other more appropriate locations.

Although the billboard industry argues that it is entitled to cash payments under the Fifth Amendment, this claim is contrary to repeated judicial rulings. Federal and state courts routinely uphold the rights of states and localities to use amortization to remove billboards.

The removal program was made even more ineffective by the policy of first paying to remove signs that were voluntarily offered by their owners. The billboard companies used this provision to unload obsolete signs that were no longer economically viable. The money received was often used to erect new billboards in other locations. A study by the Department of Transportation's Inspector General concluded in 1984 that "the Outdoor Advertising Control Program has been ineffective in improving highway beautification as the number of signs located adjacent to the nation's highways continues to increase".

TREE DESTRUCTION

Perhaps the most environmentally destructive aspect of the beautification program is its use as a justification for chainsawing and herbiciding trees on public-rights-of-way in front of billboards. When the interstates were built, the FHWA provided money to plant millions of trees along our roadsides. The billboard industry doesn't like trees blocking the view of billboards so in 1977, it persuaded the FHWA to legalize tree destruction by reclassifying it as "vegetation control" State officials now annually issue thousands of tree cutting permits to

sign companies. Many of the trees being destroyed were originally planted under the federal landscaping program.

Not only has this legalized vandalism, destroyed hundreds of thousands of publicly owned trees, but the 1984 study by the Department of Transportation's Inspector General concluded that "the policy had also hindered the removal program by giving thousands of nonconforming billboards new life"; otherwise the signs would have been abandoned because they would have been obscured by vegetation growth. Even so, the FHWA has refused to change the policy.

BILLBOARDS AND TAXATION

Billboard companies are "users" of the federal highway system, but unlike motorists, truckers and other road users, the billboard industry currently pays no road user taxes, tolls or fees to use our roads. Likewise, there is no Federal property tax or excise tax on outdoor advertising.

The costs associated with individual billboards along interstate and primary roads vary, but for the most part depend on the traffic count of the road and visibility of the billboard.

For the 125 member companies of the Outdoor Advertising Association, the average monthly cost per unit (1988) was $476.00 for poster panels and $2,522 a month for painted buletins.

In other words, the average painted bulletin (the typical billboard along an interstate) is earning $30,264 a year. Despite the enormous revenues generated by billboards, there is currently no federal permit fee to operate a billboard along a federal highway. Annual state fees vary from 50¢ a year in California to a

maximum of $125.00 a year in New Jersey.

It is time to end this national disgrace and reform the Highway Beautification Act so that it preserves national beauty, protects our trees, parks, historic districts, and scenic roads and provides a mechanism for removing nonconforming billboards.

We urge the Subcommittee to support changes in the Act which will:

1) Halt the construction of new billboards along federal highways;
2) Limit the size and height of existing billboards;
3) Increase spacing between existing billboards;
4) Prohibit the destruction of trees on public land in front of billboards;
5) Remove existing billboards along designated scenic roads and near historic sites and districts, national, state and local parks, wetlands, and other areas of critical environmental concern.
6) Either restore local governments ability to remove nonconforming billboards or appropriate money to meet the cash payment requirement.
7) Impose a federal permit fee on billboards and use the money for effective enforcement of the act; and
8) Promote alternative forms of motorist information including logo signs, low-frequency radio and other environmentally benign alternatives to billboards.

Thank you for your consideration.

National Trust for Historic Preservation

Testimony of

ELIZABETH S. MERRITT
CHIEF LITIGATION COUNSEL
NATIONAL TRUST FOR HISTORIC PRESERVATION

before the

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES

on the

REAUTHORIZATION OF FEDERAL SURFACE TRANSPORTATION PROGRAMS

March 15, 1990

Mr. Chairman and members of the committee, it is a pleasure to have the opportunity to appear before you today to express the views of the National Trust for Historic Preservation on the future of federal surface transportation programs.

The National Trust was chartered by Congress in 1949 to lead the private sector historic preservation movement. Today, with nearly 235,000 dues paying members and more than 3,000 member organizations in every state, the National Trust works to revitalize urban neighborhoods and small town main streets, to conserve more than 100 historic places, and to advocate historic preservation as a fundamental value in community planning and development.

THE HISTORIC PRESERVATION -- TRANSPORTATION LINK

It is more than a coincidence that the Department of Transportation (DOT) Act, which created the department, and the National Historic Preservation Act, which established today's national historic preservation program, were both signed into law by President Lyndon B. Johnson on October 15, 1966. For the history of the national preservation program and federal transportation policy are closely intertwined.

The impetus for a vigorous federal role in historic preservation was provided in part by the peril that historic areas faced from the aggressive and destructive federal urban highway projects of the 1960s. With rights of way bulldozed through many historic, and often low-income, areas of the nation's cities, Congress recognized that the federal government's funding of these transportation links carried with it a significant risk of destroying historic places.

1785 Massachusetts Avenue, N.W.
Washington, D.C. 20036
(202) 673-4000

In order to respond to this risk, Congress endowed the Department of Transportation with a special responsibility for protecting and enhancing the resources that would otherwise be most vulnerable to harm from the nation's transportation program. In creating the Department of Transportation, Congress declared a national policy that

> special effort should be made to preserve the natural beauty of the countryside and public park and recreation lands, wildlife and waterfowl refuges, and historic sites.

To implement this preservation policy, Congress included Section 4(f) of the Act, which prohibits federal transportation projects from harming historic places unless there is no "feasible and prudent alternative" to doing so and, even then, the projects must include "all possible planning" to minimize the harm.

Thus, on the same day that the National Register of Historic Places was formally created, a federal transportation law was enacted to provide historic places with strong protection from the destructive potential of federally-funded transportation projects.

THE IMPORTANCE OF A PRESERVATION POLICY

Almost 25 years later, the preservation policy of the DOT Act and the protections of Section 4(f) remain an effective force for historic preservation, saving historic neighborhoods and landmarks for future generations. Section 4(f) is today one of the most important and most effective federal historic preservation protections. In fact, the National Trust supports the application of the substantive protection standards of Section 4(f) to other federal agencies and programs.

The National Trust advocates the continued use of Section 4(f), and the policy it implements, as a fundamental building block of any new federal transportation policy. Therefore, it is especially disappointing that the preservation policy of the DOT Act and Section 4(f) are entirely overlooked in the new Statement of National Transportation Policy released this past week. Incredibly, we find not even a single reference to Section 4(f) in this entire 129-page report.

As the Administration and Congress consider the future of federal surface transportation programs, we believe that strong support for the preservation policy of the DOT Act and Section 4(f) is a litmus test of the nation's commitment to the conservation of our natural and historic resources.

THE NEED FOR VIGOROUS IMPLEMENTATION OF SECTION 4(f)

The National Trust has undertaken a major institutional effort to ensure the vigorous implementation of Section 4(f). Ten times in the last ten years, the National Trust has gone to federal court to enforce the Department of Transportation's compliance with Section 4(f). Many of those controversies have resulted in strong legal precedents that mandate adherence to both the letter and spirit of the law.

One example is known as the "constructive use" doctrine. Under this doctrine, courts have uniformly held that Section 4(f) applies not only to projects that will cause the total destruction of historic and natural resources, but also to transportation projects that will substantially impair the value of historic sites and parks. Thus, Section 4(f) extends to such harmful impacts as noise, air pollution, vibration, and visual blight.

Two recent projects illustrate this point. In Fort Worth, Texas, after the U.S. Court of Appeals mandated compliance with Section 4(f), in a case in which the National Trust participated as a plaintiff, state and federal highway officials set aside a plan to double the width of an overhead Interstate highway. The plan would have had a devastating impact on several important historic buildings and architect Philip Johnson's renowned Water Garden park. Instead, a new alternative was selected, which involves relocating the entire highway using a below-grade design. This plan has been endorsed enthusiastically by highway officials and historic preservation advocates alike.

More recently, in Mobile, Alabama, a lawsuit by the National Trust led to two federal courts finding that a proposed elevated waterfront highway was required to comply with Section 4(f). Following these rulings, highway officials revised the six-mile project so that it would no longer adversely affect a number of historic sites, including Mobile's national historic landmark city hall.

In both of these cases, the Section 4(f) process itself led to the successful modification of highway projects in a creative way that will resolve transportation problems without harming the vital historic resources of those cities. In our view, this is exactly the way Section 4(f) is supposed to work, by encouraging the adoption of viable transportation alternatives that enhance and protect historic resources.

Currently, the National Trust is urging the Federal Highway Administration to deny funding for a 6.2-mile, half-billion dollar highway that the State of California proposes to bulldoze through five historic districts in South Pasadena, California. This massive highway will destroy nearly 1500 homes and 7000 trees. In our view, this project does not meet the high standard of environmental responsibility that Section 4(f) mandates, because feasible and prudent alternatives exist, which will be much less destructive of historic and natural resources. The Department has not yet made a decision on this project.

On an almost daily basis, Section 4(f) works to discourage the loss of the nation's heritage. That is why we find its absence from the new transportation policy so disappointing. And that is why we are also extremely concerned by a recent regulatory proposal from the Federal Highway Administration and Urban Mass Transit Administration to cut back on strong case law that the National Trust was instrumental in establishing. [55 Fed. Reg. 3599 (Feb. 2, 1990).] The Department has proposed narrowly restricting the application of the constructive use doctrine in such a way that seriously jeopardizes historic and natural sites threatened by the indirect impact of transportation projects.

The successful outcome of the Section 4(f) process in Fort Worth and Mobile, described

above, would not have been possible without this important precedent. In the National Trust's view, the constructive use doctrine should be enshrined, not undermined, in the Department's regulations.

A PRESERVATION AGENDA

But even with the vigorous application of Section 4(f), the federally subsidized destruction of historic places by transportation projects continues. The lure of low-match federal highway funding can encourage state and local governments to trade off their heritage for the promise of highway mobility. And that very promise is too often illusory as new highways induce new development, more traffic and result in gridlock. Once again, this reality is not acknowledged in the Statement of National Transportation Policy.

Therefore, the National Trust urges that any new federal transportation program build on the preservation policy of the 1966 Act and Section 4(f) to incorporate those fundamental policies into the design of the program. Meeting this goal will require a multi-pronged approach. Today we would like to suggest some of the elements of that approach.

Stronger Emphasis on Integrated Planning. Any commuter in the nation's major cities experiences daily the results of transportation planning that has failed to include adequate consideration of land use impacts, environmental consequences and preservation concerns. These commuters have seen how new highway links built to relieve traffic are soon gridlocked by the new development they encourage. And they see how urban beltways, whose ostensible purpose was routing interstate traffic around urban centers, have become anchors for traffic-inducing suburban sprawl.

To restore the connection between transportation decisionmaking and broader community concerns, we recommend that new legislation should condition the receipt of federal funds on the development of state and local plans that demonstrate an appreciation for this necessary integration. Such planning would place highway and transit improvements in a larger context of economic development, growth management, and conservation.

This recommendation is wholly consistent with the Secretary's Statement of National Transportation Policy. Significantly, federal law already provides one appropriate mechanism for accomplishing this goal. Section 134 of Title 23 provides for the development of transportation plans

> which are formulated on the basis of transportation needs with due consideration to comprehensive long-range land use plans, development objectives, and overall social, economic, environmental, system performance and energy conservation goals and objectives ....

This policy is known commonly as the "3-C" process, after its mandate that the planning process shall be "continuing, cooperative, and comprehensive." The vigorous application

of this philosophy should be at the core of the federal surface transportation program.

Flexible Funding Options. The National Trust supports the reorientation of the federal highway program away from an outdated emphasis on destructive new highways and toward flexible solutions to transportation needs that are consistent with, and supportive of, the conservation of the nation's natural and historic resources.

New legislation must provide sufficient flexibility to state and local transportation officials to ensure that the federal government itself does not encourage more destructive options simply because of the fear of losing federal funds. The Statement of National Transportation Policy appropriately endorses greater funding flexibility. However, it only acknowledges that such flexibility will help find the most cost-effective solution. This approach is too restrictive. Funding flexibility should be used to promote project compatibility with the Department's preservation policy as well as serving to address cost considerations.

One model for this approach is the historic bridge provisions of the Highway Bridge Repair and Replacement Program. Section 123 (f)(2) of the Surface Transportation and Uniform Relocation and Assistance Act of 1987 (STURAA) enables states to "trade in" federal funds earmarked for the demolition of obsolete historic bridges to enable public or private entities to assume responsibility for and restore historic spans. In addition, it clarifies that preservation costs are eligible for federal funds when a historic bridge is being rehabilitated.

Mitigation Incentives. New legislation should also provide affirmative incentives for state and local governments to incorporate historic preservation activities into their transportation programs. Given the enormous potential for highways to harm or destroy historic places, federal law should encourage state and local governments to use a portion of their funds to conserve and protect these resources.

For example, federal funds could be made available to states on an unmatched basis for preservation expenditures related to highway and transit projects. These mitigation funds could be used for site protection, rehabilitation, interpretation or other conservation purposes, which would further the Department's mandate of enhancing the natural and cultural environment. The amount of these additional federal funds could be based on a percentage of overall project costs.

Scenic Byways. The National Trust has also found that in many cases transportation projects can actually contribute to the enhancement and conservation of historic, scenic and natural resources. By providing access to historic resources and public information on nearby historic attractions, highways and transit links can further historic preservation. The National Trust supports the creation of a nationwide system of scenic byways to designate and protect transportation corridors of superior scenic, natural and historic value.

Billboards. Finally, Mr. Chairman, we support the testimony that you will receive today that urges the removal of federal support and protection for roadside billboards. Too many outstanding historic landscapes have been marred by federally subsidized

commercial display advertisements. Providing information to motorists about commercial and noncommercial attractions can be consistent with a federally supported transportation program. Billboard blight is not.

CONCLUSION

Mr. Chairman, the ties between the federal historic preservation program and transportation policy are strong. While the goals of these two programs are different, they are not incompatible. We believe that transportation projects can be planned in a manner that minimizes harm to historic resources and actually enhances the natural and cultural environment. That is the essence of the recommendations we have made today.

As you proceed, it may be helpful to consider the words of Budget Director Richard Darman from his introduction to this year's Administration budget proposal. Darman wrote

> To the extent that investing in the future tends to emphasize technological advances -- as it should -- there is a need to assure a counterbalancing attention to aesthetic values.

The National Trust is eager to work with the Committee and the Administration to incorporate the preservation of the American heritage into a new transportation vision.

BEFORE THE

UNITED STATES HOUSE OF REPRESENTATIVES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION

STATEMENT OF THE OWNER-OPERATOR INDEPENDENT DRIVERS ASSOCIATION, INC.

Hearing on Reauthorization of the Post-Interstate Surface Transportation Programs

K. MICHAEL O'CONNELL
Counsel

March 15, 1990

Mr. Chairman, Committee members, Committee staff, my name is Michael O'Connell, and I am Counsel to the Owner-Operator Independent Drivers Assn., Inc. ("OOIDA" or "Association"). OOIDA is the national trade association representing the interests of the nation's more than 350,000 independent truck owner-operators. Headquartered in Oak Grove, Missouri, OOIDA has over 14,000 members in all 50 states, and is the second-largest trade association in the trucking industry.

Owner-operators are small business men and women who own and operate individual class 7 and 8 trucks and small truck fleets. Collectively, owner-operators are responsible for approximately 40% of the intercity truck traffic in the United States. They engage in the transportation of commodities exempt from the regulations of the

Interstate Commerce Commission or lease their equipment and services to private and for-hire motor carriers. Many have obtained their own motor carrier operating authority from the Interstate Commerce Commission. Owner-operators provide a vital transportation service which must be protected as we enter a new decade and plan for the 21st century. As small business men and women who operate an average of more than 90,000 miles per year, and spend in excess of 300 days per year on the nation's highways, owner-operators are vitally interested in all trucking issues that affect the health, safety and integrity of all commercial vehicle drivers.

GENERAL COMMENTS OF THE ASSOCIATION

The Association welcomes this opportunity to share with the Committee the interests of its owner-operator members, as well as the interests of all commercial vehicle drivers. The Committee has a substantial task ahead of it as it begins work on the reauthorization of the surface transportation programs that expire at the end of Fiscal Year 1991. OOIDA believes that if all of the major interests within the surface transportation industry focus their collective talents and resources on our common problems, great strides can be made in maintaining this country's transportation system as the finest in the world.

As Secretary Skinner recently stated in the forward to the National Transportation Policy, in the next decade "we have an opportunity to address the challenges of a changing society, a changing economy, new technology, and new roles and possibilities for all the members of the transportation community." OOIDA believes that reauthorization of the surface transportation programs will be a process of great significance to the transportation industry as a whole, and will set the tone for the nation's highway policy well into the 21st century. For that reason the programs must be carefully weighed, fairly structured, and long term in nature.

The issues that we face in reauthorization are complex. The solutions are not easy and will require a certain amount of compromise. OOIDA urges the members of this Committee not to compromise the traditionally strong federal leadership role in molding the nation's transportation policy, and not to shift policy leadership to the states. At the same time, the Congress must balance the interests of both federal and state and local governments by placing the burdens of program funding and maintenance at the most appropriate levels.

The marketplace is the best judge of the choices among the various modes of transportation. The federal government has always avoided substituting its judgment for that of the marketplace, and this must continue to be its policy in the future. Unfortunately, the recently released National Transportation Policy implies that problems such as congestion and air quality can be dealt with through policies that favor specific transportation modes over others. Such a policy is inconsistent with a market driven approach and bad public policy. As such, it should be rejected. This Committee should not permit the diversion of highway user funds to other projects in the name of "flexibility."

SPECIFIC COMMENTS OF THE ASSOCIATION

While there are a great number of issues that have a direct and significant impact on all commercial vehicle drivers, OOIDA would like to specifically address the following: (1) the need for strong national leadership in federal highway policy; (2) the policy of using toll roads to fund the highway system; (3) the uniformity of enforcement of safety regulations; and (4) further economic deregulation of the truck transportation industry.

Strong National Leadership

America needs strong leadership in developing and implementing the nation's

highway policy. The Association understands that, at a time of serious federal budget constraints, increased reliance must be placed on state and local governments and the private sector to provide some of our basic transportation services. However, the federal government cannot abdicate its historic leadership responsibilities in this vital area. While the states have an important role, the federal government is the only entity that can ensure that a national system is maintained. The Association believes that a retreat to a more significant role for the states in highway policy would seriously weaken our highway system.

Over the past several decades, the truck transportation industry has been victimized by a patchwork of ill-conceived state taxation policies and regulations. Many states have enacted taxes that are specifically aimed at out-of-state truckers. State legislatures have exhibited extreme short-sightedness and the lack of political will to impose these "user fees" on their own citizens. The fragmentation of surface transportation through the use of discriminatory and retaliatory taxes is a serious issue that has negative implications for the competitiveness of industries utilizing highway transportation, as well as for the transportation industries themselves.

Many of these taxes are merely taxes on interstate commerce. The U.S. Supreme Court has declared certain types of these state taxes unconstitutional; however, it is not certain whether states must refund such collections. As one type of tax is overturned, the states impose others, such as property and income taxes on trucks merely passing through the state. The Commonwealth of Pennsylvania alone collected more than $350 million in illegal taxes which may never be refunded to the large and small motor carriers and owner-operators who paid them.

Unfortunately, this scene has been replayed in over a dozen other states. OOIDA fears that a transportation policy which emphasizes state revenue generation and "flexibility" in spending of highway taxes will substantially worsen an already critical situation. It is far easier for a state to enact a discriminatory tax than it is for a

trucking company to avoid passing through that state. Such a situation cries out for a strong national transportation policy and a national emphasis in financing the system.

State and local governments should not be given greater leeway to raise revenues from the transportation industries. There will always be a political incentive to tax out-of-state interests, with no effective representation of those interests in the taxing and spending decisions. Any policy that encourages states to raise highway funds should flatly prohibit states from imposing taxes on highway users in order to fund projects in other transportation modes, or which might be totally unrelated to our critical highway needs.

In addition to the issue of taxation, the states have enacted burdensome and duplicative licensing, permitting and registration requirements. These requirements represent an enormous cost and lost productivity both to the trucking industry and the industries that it serves. Within two years it will be easier for truck traveling in Europe to move between countries than for one to move from New York to California. This issue has persisted for many years, and cooperative efforts have largely failed to address it. It is now time to preempt the ability of the states to obstruct commerce in this manner.

Use of Toll Roads

Secretary Skinner's National Transportation Policy has, unfortunately, opened the door to the possibility of increased use of state-sponsored and private sector toll roads. Such a policy is a significant departure from the historic federal policy that has discouraged their use. OOIDA strongly believes that this is the wrong direction for highway policy. We should continue to fund highways principally at the federal level. We should not allow states to collect revenues from tolls on roads where they also receive federal transportation funds. Tolls are a very effective mechanism for state governments to tax interstate commerce passing through their states. It is simply not

necessary to consider to toll roads as a policy at a time when the Highway Trust Fund is showing a substantial surplus.

Highway Safety

A safe highway system is of paramount concern to the nation's owner-operators. While much has been done in this area, there is substantial room for improvement through proper focusing of safety resources. The Association strongly believes that the advent of the new Commercial Driver's License will improve the overall quality of commercial operators on the nation's highways, to the advantage of all drivers. It represents a landmark change in the level of knowledge and skill necessary to become a professional driver. OOIDA believes that the benefits resulting from the CDL should be thoroughly assessed before further safety legislation, possibly mandating costly and exotic technologies, is considered.

The federal government must assume a strong leadership role in overseeing the enforcement of existing highway safety regulations. While delegating the appropriate level of enforcement discretion so that state and local governments can protect their own unique interests in highway safety, the federal government must prevent the states from proceeding in a fashion that is aimed more at raising revenue and fulfilling personal political goals than at promoting safety. These objectives are inconsistent with highway safety and are ultimately counterproductive.

A recent press report indicated the great displeasure of a Missouri school district that was losing revenue because a local truck scale had been closed. In another recent incident, a California city fined a trucker $2,500.00 for a simple logbook paperwork violation. A series of reports from Tennessee indicates that the Chairman of that state's Public Service Commission is "fighting the good war" against truck drivers by searching their trucks and sleeping compartments without probable cause. These sorts of incidents raise serious concerns among drivers as to the legitimacy of such "safety"

efforts. They also lead to a counterproductive, adversarial relationship.

The Association urges the federal government to actively address these issues and to facilitate the uniformity of state safety enforcement as well as registration and taxation. States must not be allowed to use federal highway regulations as a cover for raising revenues for uses unrelated to our transportation needs. Problems such as those described above have been allowed to continue (and to grow) for far too long. This Committee should address them as part of reauthorization, and preempt the states' authority in certain areas through conditions requiring uniformity and reasonableness placed on programs such as the Motor Carrier Safety Assistance Program.

An additional highway safety concern arises as calls mount for larger, heavier trucks. While this issue is often disguised as a "productivity" issue, it is fundamental to highway safety and protection of the infrastructure. Some size and weight proposals stretch the design limits and durability of the highway system. The Association urges the Committee to resist calls for increased size and weight limits.

Further Economic Deregulation

OOIDA agrees with Secretary Skinner that transportation deregulation must be advanced by eliminating remaining economic regulation of trucking, and that restrictions on the provision of for-hire transportation should be limited to those necessary to ensure adequate safety and liability requirements. Owner-operators, who are responsible for 40% of all intercity truck traffic, represent the most productive segment of the trucking industry. They are also the safest operators. The economic regulations that currently exist accomplish little of value; instead, they represent a barrier to direct relationships between shippers and the owner-operator segment of the industry.

The financial investment that owner-operators make in their equipment, and the psychological investment that they make in starting up and operating their own small

businesses (while at the same time spending over 300 days a year away from their homes and families), demonstrates their dedication to their chosen profession. Their strong desire to succeed and maintain their independence, combined with their willingness to work as hard as necessary to accomplish their goals, guarantees them a substantial role in the industry in the 1990's. Further economic deregulation of truck transportation will permit them to compete fairly and effectively and thus to enjoy the full benefits of their efforts.

CONCLUSION

OOIDA supports the work of this Committee and welcomes the opportunity to provide further input into the reauthorization process. On behalf of the Association, I thank the Committee for the opportunity to appear here today to express the views of owner-operators. I welcome any questions that you might have.

REMARKS BEFORE

U.S. HOUSE OF REPRESENTATIVES

PUBLIC WORKS COMMITTEE

March 15, 1990
Fran Pavley, Councilmember

Good afternoon. My name is Fran Pavley. I have been a mayor and a councilmember of the City of Agoura Hills for eight years. I am here today representing the National League of Cities and the California League of Cities. Agoura Hills became L.A. County's 83rd city in 1982. Agoura Hills is located about 35 miles west of the City of Los Angeles, nestled against the Santa Monica Mountains.

The beautification of the freeway corridor is a top priority for the residents of Agoura Hills. We have been successful in adopting ordinances to encourage quality development, while also preserving the natural beauty of our area. We have passed a sign ordinance, a protective hillside ordinance, and adopted a community-supported General Plan to help accomplish this goal.

However, we have been unable to eliminate the 30 billboards that line four miles of Route 101, the freeway which intersects our City. Federal law has made it impossible to remove these structures within 660 feet of the freeway. I am continually asked by local residents, "Why can't you do something about those billboards?" They don't understand why the state and federal governments can regulate this undesirable land use within our city limits. Our City Council has been actively seeking legislative solutions to address this problem. Our local state legislators

have authored bills on our behalf. The crux of our problem is the requirement that we use taxpayers dollars to buy out a prohibitively expensive billboard. There are no state or federal formulas to determine the value of a billboard. The lease and potential rental income, in addition to the value of the structure, determines the worth of the billboard. These figures are vague and unobtainable. According to the billboard companies, the value of each billboard could be as high as $100,000. It is interesting to note that even though the property owner is obtaining income from the improvement to his property, no additional property tax is paid by either the landowner or billboard company.

Congress should amend the Federal Act because cash payments to the billboard industry are wasteful, unwise, and constitutionally unnecessary.

First, nonconforming signs are a local problem to be solved through local law under land use powers defined by state constitutions. Practically every state court in the country has held that amortization is a constitutional method for removing billboards. The decision on whether to make cash payments or use the amortization technique should be left to local government.

What's more, billboards are a form of moveable property which can be dismantled and relocated. Indeed, the billboard industry does this all the time. When a billboard is removed pursuant to a zoning ordinance, the billboard is not "taken" and used by the government. On the contrary the billboard is simply dismantled, after which it can be put on a truck and moved to another location. The land owner, of course, retains full title to the property which can be used for any other lawful purpose.

Requiring local governments to pay cash for billboard removal gives special treatment to billboard companies not received by any other industry or nonconforming land use. All other land uses are regulated by local government without federal interference and with out cash payments. Courts have approved the use of zoning to

relocate billboards, junkyards, cement factories, taxidermists, shelters, garbage dumps, and other land uses. However, today only billboards are being singled out for special protection by Congress.

Courts say that the government interest in regulating billboards is especially strong because billboards don't derive their value from the private land they stand on but from the public roads they stand next to. Without the captive audience delivered by a public highway, billboards have no inherent value.

Last year, we had asked our state legislators to amend the Business and Provisions Code to allow local government to use amortization or cash compensation. It is legal for cities to amortize all nonconforming uses over a period of time in order that landowners have ample opportunity to recoup their investments. California courts have found reasonable amortization to be a constitutional exercise of police power which does not require compensation. Our billboards have already been in existence for 10 to 20 years, well before an amortization period would begin.

Our state legislators told us that they could not amend the state law to allow for the amortization of nonconforming billboards adjacent to interstate highways To do so would mean our state would risk losing ten percent of its federal highway money. This is the requirement of the Federal Highway Beautification Act.

Our city would like to remove billboards to meet the intent of the Highway Beautification Act. We would like the opportunity to enhance the beauty of our freeway for traveling motorists, attract quality development and improve our property values. In order to accomplish this goal, the Federal Highway Act should be amended to allow local governments the option of using amortization or cash compensation to reduce the number of billboards. Agoura Hills has now become the gateway to the Santa Monica Mountains National Recreation Area. We should no longer have to be called "Billboard Alley". Forcing cities to use taxpayer dollars to remove billboards is unrealistic. We don't pay other polluters to stop polluting, why does the federal government single out this form of pollution for special treatment? Our city's relatively small budget makes this impossible. Our limited reserves are being spent on improving the freeway overpasses and local roadways.

I've heard that the 1990's is the decade for the environment. Please amend the Federal Highway Act in order to allow local governments to use amortization <u>or</u> cash compensation to reduce the visual blight on federal highways, without jeopardizing a state's federal highway money.

Thank you.

STATEMENT OF SUSAN PERRY
SENIOR VICE PRESIDENT - GOVERNMENT RELATIONS
AMERICAN BUS ASSOCIATION
MARCH 15, 1990

Mr. Chairman and Members of the Subcommittee:

My name is Susan Perry. I am the Senior Vice President-Government Relations of the American Bus Association (ABA). It is a pleasure to be here once again to present the views of the Association, this time on the reauthorization of the highway and transit programs.

ABA is the national trade association of the intercity bus industry. We have several thousand members, some 700 of whom are bus operators engaged in intercity regular route, charter and tour, transit and commuter, and airport bus service. (The rest of our members represent the travel and tourism industry visited by the bus and its passengers, and the manufacturers and suppliers serving the industry.)

My testimony today will cover a number of issues in several titles of the reauthorization legislation that you will be developing during the coming months. I appreciate your affording us this opportunity to discuss with you these concerns and interests of ours.

By way of introduction and explanation of what the intercity bus industry is today, I would like to cite a report done last year by Robert R. Nathan Associates, Inc. entitled, Federal Subsidies for Passenger Transportation, 1960-88: Winners, Losers, and Implications for the Future. For the record, I would like to submit a copy of its Executive Summary. The report points out that while the intercity bus industry is the primary carrier of the old, the young, the poor, and those in rural America, the industry has received only 0.3 percent of the federal transportation assistance over the last 28 years. When we refer to an unlevel playing field--and say that this must be rectified--this is what we mean. Although we are not asking for direct federal subsidies, we are asking for federal transportation policy that will maintain and revitalize the only intercity service that exists for the groups of travelers I have mentioned. To quote from the report: "...private bus operators have continued trying to serve as every community's link to neighboring urban centers, ensuring that affordable transportation would be available to everyone. But now, the cumulative impact of Federal neglect has begun to take its toll on the network of intercity bus transportation." A federal transportation policy that would include attention to the following would be most helpful:

- promotion of public/private partnerships;
- development of intermodal facilities (transportation centers);

- equity of treatment, including looking at subsidies of competing intercity modes such as Amtrak and the airlines: and,
- infrastructure improvements, including high occupancy vehicle lanes (HOVs).

I believe it is appropriate for me to address some of this in more detail. Let us look at intermodal facilities. These are a win-win experience for the private and the public sectors as well as the traveling public. The recipient of federal capital dollars builds the center and uses it for its operations. The private sector operator pays rent to use it as well, thus providing income to the owner and builder while receiving a new, safe, and clean facility for the private bus operator who does not have the construction capital sufficient for its needs around the country. In one location, the traveler has two or three modes of transportation to use. There are well in excess of 50 such centers around the country at this time, and the potential for many more. The availability of federal dollars for these transportation centers benefits the private, intercity bus industry immensely but does not constitute direct subsidy to it. In fact, by paying rent, the industry pays its own way and makes a contribution to the center's operation.

Mr. Chairman, this is not a new idea for the intercity bus industry. You may recall that in 1978, with the strong support of the American Bus Association, the Surface Transportation Assistance Act authorized a Terminal Development Program. Under this program, funds were authorized for capital grants to states and local bodies to acquire, construct, or alter facilities that are used primarily for intercity bus services and to coordinate these services with other modes of transportation. After several years of no monies being appropriated for this purpose, Congress deauthorized the program. What we are suggesting today is an updated version of this 12-year old concept that appropriately incorporates the idea of transportation public/private partnership.

Another need: infrastructure improvements, such as high occupancy vehicle lanes. Unquestionably, HOV lanes are a highly cost-effective method of relieving urban congestion. And we know that there is congestion in every urban area of the country. Because this is a nationwide problem, there needs to be, we believe, federal incentives for HOV lane planning and development by local officials. Further, there needs to be melding of highway and transit funds in order to solve the problem of who is responsible for paying for HOV lanes. Reauthorization of the surface transportation programs at this time in history when there is opportunity for new and different concepts seems an ideal circumstance for solving this problem. High occupancy vehicle

lanes, which could be a major and sensible solution to an ever-increasing transportation mobility issue, should become a reality as the result of this reauthorization.

Turning from the infrastructure to a related area--that of equipment--a new problem has emerged which could be solved as well by this legislation. The intercity bus industry needs, in some instances, a 45 foot bus. This is five feet longer than the current bus that has been in use for many years. In heavily congested areas, like the Northeast corridor, it makes sense to have the most possible passengers per vehicle. Environmentally, it also is desirable to have more passengers in fewer vehicles. Our problem is not one of manufacture but, rather, one of lack of uniformity of regulation. With a few exceptions, primarily for articulated buses, 33 states have a 40 foot limit; 2 states have a 42 foot limit; 1 state has a 42-1/2 foot limit; 5 states have a 45 foot limit; 2 states have a 50 foot limit; 5 states have a 60 foot limit; and, 2 states have limits established by departmental regulation. It is unclear why 40 feet became the maximum length limit for intercity buses in a majority of the states. There is no apparent relationship that we have been able to find between the maximum length limit for intercity buses and highway safety. Since highway safety is our primary concern, and the excellent record of the intercity bus industry bears that out, we would have some pause were this an issue. Since it is not, what we need, Mr. Chairman,

is for this committee to consider preemption of these various state laws so that we may be permitted to manufacture and to operate 45 foot buses on the federal highways of this country.

Having mentioned safety, I wish to turn to it for a moment and to one particular issue that is troubling us. Knowing that this subcommittee plans to consider additional motor carrier safety legislation this year, I need to call to your attention an item of unfinished business from the Motor Carrier Safety Act of 1984. In that act, Congress mandated the extension of motor carrier safety regulations to include private, not-for-hire carriers of passengers engaged in interstate commerce. These carriers, who include churches, colleges and universities, and social and civic organizations, among others, comprise the largest group of bus operators on the nation's highways. They are not ICC-certificated and are not, therefore, required to carry minimum insurance of $5 million. They generally operate second or third hand buses tended to be mechanics who may not be professionally trained. Their drivers are the least trained. This group is most in need of strict safety regulation, yet they remain unregulated to this day--some six years after Congress said they were to be covered by the Federal Motor Carrier Safety Regulations. An advance notice of proposed rulemaking was issued on January 23, 1985 and a notice of proposed rulemaking finally was issued by the Federal Highway Administration on February 17, 1989 after much badgering, including

some prodding by the Public Works Committee. Comments were due by June 19, 1989. Now we are in mid-March of the next year and a final regulation still has not been promulgated. Once again, we bring this to your attention and request that you look into the lack of timely action on this most important component of safety on the nation's highways.

Before moving to several mass transit program concerns of the American Bus Association, I want to voice our continuing support of House Resolution 41 expressing the sense of the House in opposition to an increase in federal fuel taxes to reduce the budget deficit. Raising the fuel tax now, when there is a multi-billion dollar surplus in the Highway Trust Fund, does not make sense to ABA, let alone the idea of raising it for the wrong reason: to solve the federal deficit problem. The leadership of the Public Works Committee deserves to be highly commended for introducing H. Res. 41 and for gathering cosponsors now totaling considerably more than a majority of the members of the House. Congratulations to all of you for this and good luck in obtaining its passage by the House.

I will conclude my testimony with some thoughts of the industry on two mass transit items: charter bus service and competitive contracting of transit services.

The Urban Mass Transportation Administration, after some ten years of consideration, issued charter bus regulations on April 13, 1987. These regulations were amended by UMTA on December 10, 1988.

The regulations prohibit local transit authorities, with certain exceptions, from providing charter service with UMTA funded buses or facilities so long as private bus operators in the area are willing and able to provide the service. The regulations implement Sections 3(f) and 12(c)(6) of the Urban Mass Transportation Act of 1964, as amended, which are based on the premise that federally-funded buses and facilities should not be used in competition with the unsubsidized equipment and facilities of privately-owned charter bus operators. That principle is consistent with Congress' general policy of protecting unsubsidized, privately-owned businesses from federally-supported competition when there is competition in the private sector.

Almost three years of experience with the charter regulations have demonstrated that the Congress and UMTA acted wisely. The regulations are working to the benefit of all. Public and private bus operators have worked together to insure that all reasonable demands for charter service are met. Disagreements between the public and private sectors have been rare, but where disputes have arisen, the difference have been resolved amicably in almost every case. The ABA has assisted private bus operators and public

transit authorities in reaching agreement on charter service in such places as Flint, Michigan, Greenville, South Carolina, and Topeka, Kansas. UMTA has settled other disputes under its complaint procedures and without the necessity of court intervention.

In the 1982 Surface Transportation and Relocation Assistance Act, the Congress prohibited the Interstate Commerce Commission from granting interstate charter operating authority to recipients of governmental assistance for the purchase or operation of buses. That legislation and Section 3(f) of the UMTAct have levelled the playing fields for charter bus competition. We implore you not to disturb either of these pieces of legislation nor the resulting regulations in your upcoming reauthorization process.

My final issue for discussion today, Mr. Chairman, is another contained in the Urban Mass Transportation Act of 1964, as amended, and that is the requirement to involve the private sector "to the maximum extent feasible" in the planning and implementing of transit service. Indeed, as we have argued, there is no law that says that public transportation must be provided only by public entities; when the private sector participates in this service, as expected by the UMTAct, we have another win-win scenario for the public and private operator and the traveling public.

Where certain transit services are put out for competitively bid contracts, both public and private operators may bid. Control of the service (schedules, fares, type of equipment, drivers' uniforms, etc.) is maintained by the public agency. The winner of the bid is merely the provider of the service, not a policy maker.

Everybody wins in this public/private partnership for a number of reasons, including: the public agency chooses what service it will contract out; the private operator has the opportunity to participate in the provision of service; and, the public receives service that costs less (approximately 30 percent) because of the competition and, therefore, requires less subsidy, and saves scarce public funds.

Some current examples of competitive contracting that work are in San Diego, Los Angeles, St. Louis (suburban bus service), Houston (park and ride service), Fort Wayne, Chicago, and Snohomish County, Washington.

All the ABA asks, Mr. Chairman, is that the private bus industry's right to participate, to be included "to the maximum extent feasible," be preserved in this next round of amendments to the Urban Mass Transportation Act.

Thank you very much.

Federal Subsidies for Passenger Transportation, 1960-1988: Winners, Losers, and Implications for the Future

Robert R. Nathan Associates, Inc.
Consulting Economists
Public Policy Analysis Group
Washington, DC

May 1989

EXECUTIVE SUMMARY

The intercity bus cannot continue to serve as the single constant factor in America's transportation network without a restructuring and leveling of Federal subsidies to passenger transportation systems and modes. In 1988, less than half of one percent of total Federal transportation assistance went to the needs of the intercity bus and those who rely on its service.

A study conducted by Robert R. Nathan Associates, Inc. (RRNA) revealed that the allocation of Federal assistance to all modes of intercity transportation has — for more than a generation — placed intercity bus operators at a significant competitive disadvantage behind the providers of air and rail passenger transportation services. Despite their disadvantage, private bus operators have continued trying to serve as every community's link to neighboring urban centers, ensuring that affordable transportation would be available to everyone. But now, the cumulative impact of Federal neglect has begun to take its toll on the network of intercity bus transportation. Thousands of rural communities have been cut off from all public modes of intercity passenger transportation. More and more, low income families and the elderly are finding themselves without access to the intercity transportation network. Unless Federal assistance is distributed equitably, these trends will continue. Policies that once were designed to ensure universal access to transportation service will continue to stand as barriers to access.

The intercity bus industry received only $265 million (0.3 percent) of the $90.5 billion of total Federal outlays, net of user fees, for all modes of passenger transportation since 1960. As illustrated in Figure ES-1, commercial air carriers, general aviation, mass transit, and Amtrak each received a Federal subsidy that was more than 40 times greater.

The inequities in the allocation of Federal funds for passenger transportation are even more pronounced on a per passenger trip basis. In 1987, each time someone traveled by Amtrak, he received a subsidy that averaged $33.45 — more than 400 times greater than the average $0.08 subsidy received by bus passengers. It can be seen clearly in Figure ES-2 that the needs of bus passengers continue virtually to be ignored during the Federal budgeting process.

This discriminatory allocation of Federal funds has created an uneven playing field on which the intercity bus industry has been forced unfairly to compete with other modes of intercity passenger transportation. The unevenness of the field changed dramatically in 1971 with the creation of Amtrak. Figure ES-3 compares subsidy shares with service demand from 1960 through 1970 and from 1971 through 1987 to illustrate the competitive advantage provided by subsidies and the impact the inequitable distribution of subsidies has had on the intercity bus.

Air passenger transportation service began and ended 1960 through 1987 as the big winner in the competition for Federal subsidies to intercity passenger transportation and for intercity passenger demand growth. From 1960 through 1970 passenger air service received almost 85 percent of total subsidies to intercity passenger transportation and grew at an extraordinary rate of 13.3 percent per year. As the air service subsidy share shrank to 70 percent during 1971 through 1987, the growth rate for air transportation service also declined to 6.8 percent per year.

But Amtrak provides a more dramatic example of the impact of subsidies. From 1960 through 1970, intercity rail passenger transportation service was not subsidized and demand declined 9.6 percent per year. Since the creation of Amtrak, however, the rail service subsidy share has been 30 percent and Amtrak passenger miles have increased 6.4 percent per year.

The intercity bus industry, which received only 0.4 percent of subsidies to modes of intercity passenger transportation from 1960 through 1970 and from 1971 through 1987, managed to compete reasonably well during the earlier period before it faced heavily subsidized competition from Amtrak. From 1960 through 1970 bus demand grew 2.7 percent per year. Since 1971, however, bus demand has declined 0.6 percent per year.

As the intercity bus industry has found it harder to compete with the more heavily subsidized public modes of intercity passenger transportation, the industry also has found it harder to continue to provide service to its customer base, which, as shown in Figure ES-4, consists of rural Americans, Americans from low income families, the young, and the elderly — those with few, if any, transportation alternatives. These segments of the population depend on intercity bus service.

A more equitable distribution of Federal assistance is necessary to preserve the intercity bus transportation network — a network that links many communities that are not served by alternative public modes of intercity passenger transportation. Although regularly scheduled bus service still reaches more than 10,000 points, the number of communities served has declined by more than 50 percent since 1960. What would remain without the bus? an air and rail network that serves fewer than 1,000 cities and provides service mostly to people traveling for business purposes and to people whose incomes and areas of residence do not significantly constrain their transportation alternatives.

As Congress develops its transportation programs and budgets for the 1990s and beyond, subsidies to intercity public modes of transportation should be redirected to help those who truly need Federal transportation assistance.

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS
March 15, 1990

Mr. Chairman, Members of the Subcommittee on Surface Transportation, my name is Harold E. Smith, City Engineer for Des Moines, Iowa. I am here today representing the American Public Works Association (APWA) as its President. It is indeed a pleasure to appear before you.

The American Public Works Association is a non-profit educational and professional association whose origins date back to 1894. APWA is headquartered in Chicago, Illinois, with a governmental affairs office in Washington, D.C. The purpose of the Association is to assist public works agencies in fulfilling their responsibilities and to enable people involved in this field to work together to improve their professional practice. Membership is comprised principally of local officials, but also includes strong representation from the state and federal levels of government. Educators and representatives of the private sector are also counted among our 28,000 members.

APWA defines public works very broadly as, "the physical structures and facilities developed or acquired by public agencies to house governmental functions and provide water, waste disposal, power, transportation, and similar services to facilitate the achievement of common social and economic objectives." Both the membership and the interests of APWA reflect the breadth of this definition. The training and focus of our members, and hence our Association, are in the technical disciplines underlying the various aspects of public works engineering and administration.

To foster professional development among public works personnel, APWA has established a number of institutes that focus on the various fields of public works: administrative management, buildings and grounds, equipment services, municipal engineering, transportation, solid wastes and water resources. The Association's Institute for Transportation focuses on the development and management of the infrastructure required for all modes of transportation, including the maintenance of streets, highways, bridges, transit systems, airports, waterways, harbors, docks, and other public facilities needed for the transportation of people and goods. This Institute exists to promote high standards of competence in transportation. It conducts surveys and studies, and collaborates with APWA's Education and Research Foundations in presenting training programs and conducting research projects.

APWA and its Institute for Transportation have long been concerned with the direction our nation's surface transportation programs should take in the post-interstate era. We have been proud to serve as a member both of the Advisory Committee on Highway Policy, which under the leadership of the Highway Users Federation conducted an unprecedented series of 65 public forums across the country

38-253 O—91——31

between August 1987 and May 1988, and of the Transportation Alternatives Group, a non-partisan coalition of 12 major national public and private-sector organizations with a broad concern for the future of the nation's surface transportation.

The Transportation Alternatives Group was developed by the American Association of State Highway and Transportation Officials as a means to build consensus among the multi-varied interests concerned with transportation. It has worked diligently over the last eighteen months to identify transportation issues where a consensus was important and could be achieved. I truly believe that it is a tribute to this unique coalition that twelve diverse organizations have been able to agree to a set of important policy recommendations in the areas of program orientation, intergovernmental roles and responsibilities, and investment levels and funding sources. These recommendations can be found in the Transportation Alternative Group's final report titled "Future Federal Surface Transportation Program: Policy Recommendations," a copy of which will be provided for the record, Mr. Chairman, if you so desire.

As a participant in the Transportation Alternatives Group, APWA sought involvement of its membership to develop its own positions on the major surface transportation issues of the day, as did most of the other participating organizations. We formed a special Task Force on Transportation Policy and prepared a report called "Moving America into the 21st Century." This report, which was approved by APWA's membership at its annual meeting on September 25, 1989, lays out six principles and supporting APWA position statements for the development of the nation's surface transportation policy and implementation programs for the post-interstate era. Mr. Chairman, the American Public Works Association believes that you should consider the following six principles as you proceed with legislation to reauthorize the nation's surface transportation programs:

Principle #1: The federal government must provide increased funds from a permanent and reliable source that, together with additional state and local revenues, will correct existing deficiencies and meet future needs. It should remove existing barriers and refrain from future actions that hamper the ability of state and local governments to generate enough revenue to fulfill their responsibilities.

For the past 30 years, highway expenditures by all levels of government have declined as a percentage of the gross national product. For the past two decades, the amount of money spent on the national highway system has decreased in constant dollars. Moreover, changes in the federal tax code, court decisions, and other actions taken by the federal government have hampered the ability of state and local governments to raise revenue. At the same time, there has been a steady increase in vehicle miles travelled, leading to excessive congestion and a system that is physically deteriorating in many areas. While additional money is not the only answer, there must be a stable, reliable, and adequate source of funding. Federal excise taxes should be indexed to the gross national product to protect the integrity of the Highway Trust Fund and to relate the nation's transportation investment to economic growth.

In support of Principle #1, APWA believes that:
1. Transportation trust funds should be separated from the unified federal budget and utilized for transportation purposes without regard to the general fund deficit.
2. The sizeable balances of the transportation trust funds should be spent down by 1995 on transportation projects.
3. The Highway Trust Fund should be made permanent and federal fuel excise taxes increased and indexed to the gross national product. All such revenue should be allocated for surface transportation programs to provide a stable source of funding that is not devalued by inflation.
4. There should be a stable, reliable, and adequate source of federal aid for public transportation, preferably in the form of flexible block grants that can be used for either capital or operating expenses.
5. The federal government should adopt a long-range capital budget with emphasis on an integrated national transportation program. It should establish a fair and equitable plan for allocating costs and assuring stable sources of revenue for financing the federal share of these costs.

6. The federal government should remove existing barriers and refrain from future actions that hamper the ability of state and local governments to generate revenue from a variety of sources.
7. The federal government should encourage state and local governments to use innovative funding techniques where appropriate and with proper planning and coordination.
8. State fuel taxes should be increased to provide a greater local share of fuel tax funds for rehabilitation of the nation's system of local roads, highways, and bridges.

Principle #2: The highest priority of the national surface transportation program must be to preserve the physical integrity, enhance safety, and increase the effectiveness of existing highways, roads, bridges, and public transportation systems.

The cornerstone of any new national transportation policy should be the preservation and enhancement of existing facilities. The surface transportation network in the United States is a complex system of highways, roads, bridges, and public transportation. Many sections of the surface transportation system, including portions of the Interstate Highway System, need to be replaced. Bus, train, and other forms of public transportation are falling into disrepair. The national program must enhance the effectiveness of the present system, increase its capacity, and improve safety.

In support of Principle #2, APWA believes that:
1. Preservation of the physical integrity and safety of the existing transportation system should receive highest priority by all levels of government. Under the new program, federal aid for this purpose should be available for all transportation facilities, including highways, streets, bridges, and public transportation systems.
2. The United States Congress should increase funding to restore or replace deficient bridges.
3. The United States Congress should increase funding for the 4R (restoration, rehabilitation, reconstruction, and resurfacing) program to protect the nation's investment in the federal aid highway system.
4. APWA opposes any new national standards that would increase allowable truck sizes and weights beyond those authorized by the 1982 Surface Transportation assistance Act (STAA). More liberal weight and size standards should be prohibited until their full impact has been evaluated. State and local agencies should retain their present authority to restrict truck weights and sizes.
5. Traffic safety should be the focus of a broad-based effort involving all levels of government, private industry, and citizen groups. A comprehensive safety program should feature additional basic research, educational activities targeted toward drivers and pedestrians alike, and stricter enforcement of existing laws.
6. The Federal Highway Administration requires all state transportation agencies to adopt pavement management systems by 1993. APWA encourages local transportation agencies to implement pavement management systems, such as PAVER.

Principle #3: The partnership among local, state, and federal governments must be strengthened to integrate the many separate components that are owned, operated, and regulated by the different levels of government into an effective surface transportation system.

The success of the national surface transportation system depends on a high degree of cooperation among all levels of government, transit service providers, and freight carriers. A comprehensive and collaborative approach is critical to avoid piecemeal solutions to long-term problems. It can be achieved only if everyone concerned is willing to share the decision-making power. Moreover, regions have become the dominant players in the world marketplace. Their ability to compete is often hindered by congestion and other transportation problems that involve numerous jurisdictions. There should be a fundamental shift in the purpose and structure of the national surface transportation program to improve the competitiveness of each region in the global marketplace.

In support of Principle #3, APWA believes that:
1. There should be an adequately funded formal mechanism to support a regional perspective on the planning, programming, and funding of surface transportation programs.
2. The new surface transportation program should be flexible. It should not impose unnecessary restrictions as a condition of federal funding that hinder efforts by state and local officials to seek innovative solutions to local transportation problems.
3. Local governments and transportation agencies should be equal partners with the federal and state governments in transportation decisions affecting their jurisdictions and service areas.
4. Administrative requirements under federal aid programs should be kept to a minimum to avoid unnecessary and expensive delays. They should be designed to assure that projects meet acceptable performance standards, to provide accountability for public funds, and to provide state and local officials with enough flexibility to manage the project effectively.

Principle #4: The federal government must provide a permanent, reliable, and much greater level of federal funding for research, education, training, and the application of new and existing technology.

The need for additional basic research, training, and technology transfer has been well documented by the National Council on Public Works Improvement and others. If current and future needs are to be met, we must invest in an ambitious research program to improve the construction, maintenance, and operation of surface transportation systems. The federal government should play a leadership role in establishing a comprehensive research agenda that also includes environmental considerations. Moreover, there must be a systematic and consistent effort to transfer research findings to state and local agencies as well as to the private sector. Finally, there is a critical need for more qualified engineers, transportation administrators, and public works managers.

In support of Principle #4, APWA believes that:
1. A specific percentage of the Highway Trust Fund should be earmarked to support a national research, education, and technology transfer program.
2. The federal government should take the lead role in developing and funding a national transportation research agenda that is comprehensive in scope and coordinated with other levels of government, service providers, and private industry.
3. There should be a substantial increase in funding for technology transfer programs. These programs should be specifically designed to: a) promote the effective use of new technology by state and local agencies and the private sector; and b) encourage the widespread application of existing technology as well as effective planning, design, and management practices.
4. The national surface transportation program should assign a high priority to protecting the quality of the environment. There must be increased funding for research and development on the use of alternative fuels, flexible-fuel vehicles, and fuel distribution systems.
5. There should be a comprehensive national program to address the critical need for qualified personnel. Federal and state action is necessary to promote the education and training of transportation professionals to work at all levels of government.

Principle #5: There must be a significant increase in federal funds to address urban and suburban congestion through a flexible funding mechanism that does not mandate solutions by mode or expense category.

Cities and their suburbs present unique transportation problems, primarily because of a dramatic shift in commuting patterns since World War II. The dominant commuting pattern is suburb-to-suburb, now twice the size of the "traditional" pattern of suburb-to-central city travel. Suburban development no longer is solely residential in character, but includes many commercial, industrial, and other high-density developments. Suburbs currently account for 60% of all metropolitan workers, 47% of all job destinations, and about 67% of job growth. Urban and suburban congestion is fairly uniform throughout the United States and is projected to continue well into the 21st century. The availability of federal funds for specific categorical programs skews the decisions of state and local officials in

determining the most appropriate solutions to their congestion problems. Accordingly, there should be a shift in focus from moving cars, trains, and buses to moving people and goods.

In support of Principle #5, APWA believes that:
1. There should be a substantial increase in federal funding for metropolitan regions to reduce urban and suburban congestion. These funds should be used to promote the optimal use of existing facilities and to construct new facilities, where appropriate.
2. The national surface transportation program should provide a flexible funding mechanism that is designed to reduce congestion rather than to mandate specific solutions by mode or expense category. Categorical funding should be used only to preserve the integrity of existing transportation systems.
3. Local governments should take an active role in reducing congestion by exercising their responsibility to regulate land use and development while recognizing that their actions often affect neighboring jurisdictions.
4. Local governments should work closely with major employers, developers, and citizen groups to reduce congestion in their jurisdictions. The national surface transportation program should encourage local officials and their constituents to use such techniques as transportation management associations, community vanpools, flexible working hours, and other approaches to demand management.
5. All levels of government should develop and implement solutions to congestion that give priority to environmental considerations while meeting transportation needs in order to protect the already fragile environment of many cities and suburbs.

Principle #6: There must be increased federal funding to address the needs of rural America and provide incentives for state governments to increase their support of the existing rural transportation system and to develop mechanisms that promote intergovernmental planning and cooperation.

Like their urban and suburban neighbors, rural Americans have experienced a dramatic shift in demographic patterns and transportation needs. The loss of rail service has placed a heavy burden on the rural road system. The rural economy has diversified beyond its traditional agricultural base, but the nation's underinvestment in the transportation system has hampered this diversity and growth. Better transportation would allow rural Americans to take advantage of increasing opportunities to work in the trade, service, and manufacturing sectors. Rural communities face four major transportation challenges: 1) the growing reliance on cars and trucks on a system of roads and bridges that cannot tolerate current truck weights and sizes; 2) a system of bridges that have fallen into disrepair; 3) a network of nearly 3 million miles of roads, of which 62% are unpaved; and 4) a fragmented, uncoordinated system of public transportation. Virtually all of the burden for rural transportation falls on villages, townships, and counties that simply cannot afford to pay for routine maintenance, let alone substantial improvements. Moreover, many do not have the legislative authority to raise revenues.

In support of Principle #6, APWA believes that:
1. State governments should take a leadership role in planning, programming, and funding rural transportation systems. States should include local governments and transportation agencies in a collaborative process that incorporates a regional perspective.
2. The national surface transportation program should provide a flexible funding mechanism to state and local officials that is designed to meet the needs rather than to mandate solutions by mode or expense category.
3. State and local governments should work with the private sector to coordinate transportation, land use, and development decisions in a way that protects farmland, encourages rational development and economic growth, and preserves the physical integrity of the existing transportation system.
4. The national surface transportation program should encourage greater cooperation between the public and private sectors in meeting the public transportation needs of rural Americans through innovative mechanisms that are likely to increase the level of service, reduce cost, and make the most effective use of limited resources.

5. There should be more basic research on such issues as the design, construction, and maintenance of rural highways and low-volume, unpaved roads.
6. Federal and state governments should increase funding for technology transfer programs that focus on cost-effective solutions, which can be readily implementable by local officials. At a minimum, they should continue to fund at no less than current levels the FHWA-administered Rural Transportation Assistance Program and the UMTA-administered Rural Transit Assistance Program.

To close, as I suggested earlier, the American Public Works Association has served the public works profession, and indeed the public at large, for a long period of time. The Association will celebrate its centennial in 1994. We would welcome and appreciate no better present for our 100th birthday than to have in place federal legislation that reverses the twenty-year trend of federal underinvestment in the nation's decaying surface transportation system; takes the leadership in research, education and technology transfer; and works with state and local governments to build a sound foundation to move America into the next century.

Mr. Chairman, Members of the Subcommittee, thank you for allowing me, as the President of the American Public Works Association, this opportunity to appear before you today. If there are questions, I would be pleased to answer them at this time or provide written responses at a later date.

Dear Reader:

As Chairman of the Transportation Alternatives Group, which is often referred to as TAG, I am pleased to submit this report, **Future Federal Surface Transportation Program: Policy Recommendations**, for consideration by all those concerned about the future of our nation's transportation system.

The TAG is an unprecedented effort by a non-profit, non-partisan coalition of 12 national public and private interest groups representing users, policy-makers and service providers sharing a broad interest in the nation's surface transportation system and its operation.

While a national effort related to surface transportation necessarily includes all levels of government and the private sector, TAG members agreed that the federal program is a significant common interest. It was therefore selected as the focus for additional TAG discussions and development of this special consensus report.

Over an eighteen month period, staff representatives of the TAG member organizations discussed issues and identified major topics where consensus was both important and feasible. At a special two-day workshop of TAG member organization representatives held on October 13-14, 1989, agreement was reached on key aspects of the future federal surface transportation program in the form of sixteen consensus statements. These consensus statements represent the views of the individuals attending the workshop and are recommended to TAG member organizations and other interested parties for consideration.

I want to express my appreciation to the TAG member organizations, to the members of the TAG Chairman's Advisory Council and those individuals and organizations who have provided support to the TAG over the past two years.

Our transportation system is a vital part of our economic system, our defense readiness, and our freedom to travel as a people. The preservation and enhancement of this system is a matter of concern to all Americans. By working together, we can provide a system that meets the mobility needs of our metropolitan areas and the access needs of rural America not only for the coming decade, but for future generations as well.

Respectfully submitted,

Thomas W. Bradshaw, Jr.
Chairman

TRANSPORTATION 2020

TAG POLICY RECOMMENDATIONS

FUTURE FEDERAL SURFACE TRANSPORTATION PROGRAM

This Report sets forth the consensus of the Transportation Alternatives Group (TAG) regarding the future federal surface transportation program. This consensus represents the views of TAG staff and principals present at a summary workshop and is recommended for consideration by TAG member organizations and other interested parties.

Background

As the Nation looks ahead to the 21st Century, it is apparent that changes in the context for mobility – social and economic, geographic and environmental, institutional and technological – present an array of new problems and opportunities for transportation infrastructure and services. Current and emerging challenges facing the nation in the preservation and enhancement of mobility for people and goods have generated widespread concern.

The existing surface transportation systems as well as the programs, roles and funding guiding their development were established more than a generation ago for a society, economy and environment substantially different from that of today. The Transportation 2020 Consensus Program is a comprehensive effort to formulate a broad consensus on a new national surface transportation program for the 21st Century. Driven by concern over the absence of a long-range national policy, it has brought together for the first time public officials, private and public interest groups and citizens to assess future mobility and transportation needs.

Over the past two years Transportation 2020 activities have been structured to review the issues surrounding future surface transportation programs, examine service and investment requirements, develop and evaluate a broad range of policy options and facilitate consensus development among interested parties.

Role of the Transportation Alternatives Group (TAG)

The Transportation Alternatives Group (TAG) has been serving as the primary focus for consensus building within the Transportation 2020 Program. TAG is a non-profit, non-partisan coalition of 12 national public and private interest groups representing users, policy-makers and service providers sharing a broad concern for the future of the nation's surface transportation.

TAG has been synthesizing Transportation 2020 data as well as identifying and evaluating alternative policies and programs for meeting the surface transportation needs over the next three decades. This material has been used by TAG to guide and assist its members in consideration of policies and positions and has been available to other interested parties.

National Surface Transportation Program

Combining findings from 65 state forums, a futures conference and individual TAG member organization deliberations, TAG identified key issues facing our surface transportation system in the **TAG Issue Statement** of December 1988.

Based on further deliberations, TAG members then developed a consensus on key aspects of a new program to serve an overall policy framework for more detailed consideration in the areas of: program orientation; intergovernmental roles and responsibilities; and investment levels and sources. This consensus framework was set forth in **Basic Directions for a New National Surface Transportation Program** of May 1989. The mission statement and the major policy themes developed in **Basic Directions** are summarized below. The complete **Basic Directions** report is included as Appendix B.

Mission

TAG has stated the mission of the national surface transportation program as follows:

"The mission of the national surface transportation program is to maintain and improve mobility through the provision of safe, efficient, convenient, cost-effective, and environmentally-sensitive transportation. This program should support fundamental national economic, social and security goals."

Policy Themes

Ten key policy themes supporting this mission summarize the consensus developed in **Basic Directions**. They include:

- ☐ **Maintain the physical integrity of existing transportation systems**
- ☐ **Increase productivity, efficiency, market-responsiveness and international competitiveness**
- ☐ **Provide increased capacity in congested and developing areas and improved rural access**
- ☐ **Enhance safety of all transportation modes**
- ☐ **Reduce barriers to intermodal, interagency and public/private cooperation**
- ☐ **Develop strategies to reduce environmental and resource impacts**
- ☐ **Simplify and focus federal-aid programs**
- ☐ **Improve metropolitan and rural regional planning/programming**
- ☐ **Encourage the best available technology**
- ☐ **Commit to needed investment level increases**

Future Federal Program Consensus

While a national effort related to surface transportation necessarily includes all levels of government and the private sector, TAG members agreed that the federal program is a significant common interest. The federal program was therefore selected as the special focus for additional TAG discussions and development of this special consensus report.

Key topics where consensus was both important and feasible were initially identified. At a special two-day workshop of TAG member organization principals, agreement was reached on key aspects of the future federal surface transportation program in the form of sixteen consensus statements. These consensus statements represent the views of the Workshop attendees (see Appendix A) and are recommended to TAG member organizations and other interested parties for guidance and assistance in consideration of their policies and positions.

Federal Program Consensus Topics

Topics which were the focus of consensus discussion are listed below. The order of presentation does not denote priority.

A. Program Orientation

A.1. Federal Program Focus/Priority

A.2. Federal-Aid Program Structure

A.3. Nature and Extent of "National Highway System"

A.4. Flexibility of Urban, Suburban and Rural Programs

A.5. Specific Program Issues

A.5.1. Safety

A.5.2. Bridge Replacement and Rehabilitation

A.5.3. Systems Productivity

A.5.4. Freight/Trucking Operations

A.5.5. Intermodal Access and Integration

A.5.6. Air Quality

A.5.7. Scenic Byways

A.5.8. Intercity Passenger Rail and Bus

A.5.9. Research, Development and Technology Transfer

B. Intergovernmental Roles and Responsibilities

B.1. Decision-making: Level, Style and Process

B.2. Funding Allocation and Recipients

C. Investment Level and Sources

C.1. Level of Federal Investment and State/Local Matching

Consensus Statement Format

For each of the above topics, a brief background discussion is followed by a statement of the TAG consensus policy developed by the staff and principals at the Workshop (in bold type).

FEDERAL PROGRAM CONSENSUS TOPICS

A. PROGRAM ORIENTATION

The orientation of the federal-aid surface transportation program within the overall mission as stated above is determined by the way in which the program and priorities reflect major objectives. TAG has agreed that the existing federal-aid surface transportation policies and programs need to be refocussed and restructured so as to more directly address key transportation-related issues.

A.1: FEDERAL PROGRAM FOCUS/PRIORITY

Federal transportation policy historically has placed priority on capital investment for new highway and transit systems serving interregional and interstate transportation. In recent years, this focus expanded to include capital maintenance activities (reconstruction and rehabilitation) which previously had been solely the responsibility of the state and local government system owners.

The substantial backlog of requirements for reinvestment in existing systems and facilities competes with new requirements for capacity increases. These occur, not only on the upper level systems serving long distance trips, but in response to metropolitan-wide congestion that cannot be served by such systems alone. In rural areas new demands also place special burdens on local roads.

At the same time, there is increasing recognition that the nation's urban highway and transit systems are not operated at their highest level of efficiency and that improved operations can produce immediate cost-effective benefits.

These competing demands for federal aid raise the issue of the relative balance that must be struck among reinvestment, capacity expansion and improved productivity of the existing system in an effort to meet today's transportation needs as well as those of tomorrow.

TAG Consensus: Flexibility to respond to both reinvestment and capacity expansion should be a primary feature of a new surface transportation program. The federal role should ensure preservation of the physical and operational integrity of the major elements of the existing surface transportation system, including highways, bridges and public transportation and should support the nation's economic goals. In addition, the federal program should provide for capacity expansion to improve mobility as well as safety — focussing on addressing interregional and interstate travel needs, relieving urban/suburban congestion, and improving rural access.

Both reinvestment and capacity expansion programs should include a strong commitment to enhanced productivity through operational improvements, increased vehicle occupancy, and appropriate design guidelines to promote efficiency and reduce life cycle costs.

A.2: FEDERAL-AID PROGRAM STRUCTURE

Federal funding for surface transportation is currently provided though a large number of separate categorical programs. Federal aid is distributed:

- ☐ **by separate modes (highway and transit),**
- ☐ **on predefined, functionally classified systems or project types within each mode,**
- ☐ **for use on narrowly-defined eligible project activities and accepted facility standards,**
- ☐ **on a formula or discretionary basis,**
- ☐ **to designated recipients (states and transit agencies) with some funds earmarked for urban areas of specified sizes**
- ☐ **assuming varying degrees of consultation between state and local government consistent with certain regional intergovernmental planning requirements.**

The current approach emphasizes developing several functionally-defined systems at the expense of providing flexibility to tailor investments to specific state, regional and local problems and circumstances. At issue is whether the surface transportation program should reinforce both the modal and functional system focus -- or, alternatively, be geographically and problem-focussed to provide increased flexibility to state and local governments to address priority problems less restricted by existing modal and system definitions and standards.

TAG Consensus: **The new surface transportation program should include a renewed federal commitment to a national highway system, public transportation, and an increased emphasis on urban/suburban mobility and rural access. Selected categorical programs should be simplified and consolidated with programs focussed on metropolitan and rural needs.**

A.3: NATURE AND EXTENT OF "NATIONAL HIGHWAY SYSTEM"

Within the federal-aid transportation program certain investments have been accorded special priority as evidenced by federal system designation, level of investment and favorable matching ratios. Within the highway program, for example, special priority was accorded to the development of a high standard national highway system to accommodate longer distance trips and interstate travel.

A key issue regarding the future program is the nature and scale of such a national highway system and whether its focus should be limited to the existing Interstate System and its preservation or, in addition, include extension of this concept via an expanded system. A closely related question is the degree to which such a system can be integrated with a response to localized mobility problems and, if so, the appropriate process and participants in such a redefinition.

TAG Consensus: A national highway system of transportation services and facilities must serve multiple goals and interests including defense mobilization, commerce, economic development and access, and congestion relief — at a high level of service appropriate to the nature and length of such trips. National policies and programs must recognize that the mix and priority of these goals will vary in rural, small urban and major metropolitan areas as well as from state to state.

The national highway system must, at a minimum, include the existing Interstate System and have as a priority the preservation of its desirable physical and operating characteristics. The overall system should result as part of a plan developed by the federal government working in collaboration with state and local governments.

A.4: FLEXIBILITY OF URBAN, SUBURBAN AND RURAL PROGRAMS

Increasing congestion in urban and suburban areas and the need to improve rural access requires the mobilization of a broad range of approaches carefully tailored to meet local circumstances. The existing modal, system, and project eligibility definitions tend to inhibit cost-effective solutions and available program funds often do not match state and local priorities.

The desired flexibility at the state and local level can be achieved through reductions in mandates, simplification and consolidation of programs, increases in transferability of funds, flexibility in design standards and greater latitude in eligible project activities. Options range from restricting funds to a reduced number of specific facility types on predesignated systems within modes to making funds available for any investment determined in an intergovernmental planning process.

TAG Consensus: Substantial simplification and increased flexibility and discretion should be introduced into the new surface transportation program to permit state, regional and local governmental units to more effectively meet specific urban, suburban and rural transportation needs. These should be accompanied by increased accountability for transportation decisions. The new program should include the full involvement in the process by appropriate levels of government and a general reduction in non-transportation mandates along with consolidation and transferability among certain programs.

A.5. SPECIFIC PROGRAM ISSUES

Beyond changes in broad policy orientation and program structure, certain specific program issues require special consideration in the development of a new surface transportation program. Those topics are presented below:

A.5.1: Safety

Highway-related accidents continue to be the number one cause of accidental death. Despite a 50 per cent reduction in the fatality rate over the last 20 years, fatalities continue to increase with growth in vehicle travel. The projected doubling of travel together with changes in the mix of vehicle types, variable licensing and enforcement practices, changing operator capabilities – including more elderly drivers – will pose new challenges in the future. Design improvements, uniformly high standards in driver requirements, education and enforcement, and "crash-worthy/crash avoidance" technologies offer important potential to reduce accidents, injuries, and fatalities.

TAG Consensus: There should be an increase in safety-related capital investments and operational improvements. All possible consideration should be given to safety in planning, design and rehabilitation. Additional resources need to be focussed on education and enforcement at all levels of government. Federal resources should focus on overall safety management and incentive programs.

A.5.2: Bridge Replacement and Rehabilitation

Despite significant improvement in recent years, there is a substantial backlog of bridge rehabilitation and replacement facing most states and local governments. Substandard bridges both on and off-system – jeopardize safety, threaten economic productivity, and represent a substantial burden to responsible jurisdictions. An important question is how to address bridges programmatically given the large investment requirements often associated with major bridges and the uneven distribution of substandard bridges throughout the country.

TAG Consensus: Bridge rehabilitation and replacement is a high priority and should be an eligible expenditure from highway programs.

A.5.3: Systems Productivity (Operations and Management Emphasis)

Given current and anticipated urban and suburban congestion problems, it is essential that the most efficient use be made of both existing facilities and services as well as new transportation investments. At present, however, the best available technologies and strategies to improve operations are not widely applied despite their proven cost-effectiveness and immediate potential. In addition, few metropolitan areas have developed organized responses to manage incidents which cause more than half of urban freeway delay. In rural areas, consistent application of appropriate design standards pose a similar challenge.

In addition, federal aid is not currently available for certain types of improvements that offer opportunities for efficiency or substantial savings. These include off-system "reliever" roadway improvements and certain types of smaller transit vehicles more appropriate for suburban

densities. Advanced acquisition of scarce right-of-way often faces legal and regulatory difficulties.

TAG Consensus: The most efficient use of urban and suburban transportation facilities should be promoted through support for traffic operations, surveillance and control techniques, and incident management along with positive incentives to increase the availability, use and support of public transportation and all other forms of high-occupancy/shared ride services. Cost-effective transportation design standards and appropriate operational improvements should also be promoted in rural areas.

A.5.4: Freight/Trucking Operations

The efficiency of goods movement is a key aspect of improved economic productivity. The "lighter" more dispersed economy, deregulation, industry reorganization and new technology together with evolving market requirements have introduced new challenges for the motor carrier industry. In the context of a new surface transportation program, key issues are raised, both regulatory and operational. These issues include: (1) the acceptable size and weight of vehicles (2) on a redefined national truck network (3) with access to off-system destinations. Resolving these issues requires increasing trucking efficiency while simultaneously minimizing truck impacts on urban and rural systems.

TAG Consensus: The productivity of freight transportation should be enhanced while at the same time working to assure equitable cost allocation among highway users and minimizing adverse safety and community impacts.

Regulatory uniformity regarding freight operations should be improved through cooperative, coordinated efforts among federal, state, and local governments under guidelines which provide the maximum feasible access to labor pools, markets and areas of production consistent with safety.

Federal policies should encourage shippers and receivers within metropolitan areas to work with public agencies to consider flexible delivery hours where economically feasible in an effort to reduce congestion and improve delivery reliability.

A.5.5: Intermodal Access and Integration

Inadequate linkages and gaps between modes of transportation tend to create inefficiencies in the nation's transportation system – urban, suburban, rural, intercity, and international. Problem areas include highway and transit access to intermodal freight and passenger terminal facilities, intercity/urban bus connectivity, and park-and-ride facilities. Even when eligible for federal aid, implementation of key intermodal access links may fall victim to interjurisdictional problems or conflicting program responsibility.

As the nation's passenger and freight system both become increasingly intermodal and global, the lack of standardization in both facilities and equipment is a related concern and can have a major impact on the productivity of each modal system.

There is currently no institutional focus or responsibility for intermodal problems – either domestic or international.

TAG Consensus: The increasingly intermodal aspects of international, interregional and local transportation should be addressed on an integrated basis in federal, state, regional and local planning programs. Highway-related intermodal access projects should be eligible expenditures from highway programs, including: access roads to ports; airports; railheads; inland waterway facilities; bus terminals and transit stations; and parking facilities at bus and rail terminals and transit stations.

A.5.6: Air Quality

In many major metropolitan areas today, maintaining acceptable air quality is a major challenge. Vehicle emissions produce carbon monoxide and contribute significantly to the formation of ozone, both major health-related pollutants. Tighter controls on fuel volatility and emissions required under current law, if met, will postpone exacerbation of this problem in the short run in many non-attainment areas. However, the next decade's growth in vehicle travel may offset these reductions as well as those introduced from fleet turnover.

Stationary sources also are a very significant contributor to pollution. Many stationary sources have not matched vehicles in their emissions reductions.

In the long run, major reductions in air pollution in many metropolitan areas will depend, in large part, on improvements to vehicles that significantly reduce emissions and/or introduction of less polluting fuels and improved fuel handling systems, together with significant reductions in emissions from stationary sources.

In the short run, reductions in the rate of pollution increase in non-attainment areas may also depend on non-technological strategies aimed at moderating the rate of growth in vehicle miles travelled (VMT). This places special significance on increased vehicle occupancy and other transportation improvements and programs that can both improve mobility and reduce the relative rate of emissions increases.

TAG Consensus: Comprehensive transportation supply, demand and technology strategies should be developed that meet mobility needs and complement the attainment of air quality standards. Reductions in air pollution depend on improvements in vehicle emissions and fuel standards as well as non-technical strategies aimed at reducing the relative rate of emissions increase.

A.5.7: Scenic Byways

The economic significance of the tourism industry and the importance of pleasure driving and recreational access are growing. Recreational and social trips now constitute one-third of all travel, and tourism is a major industry in most regions. Vacation-related travel – the longer trips – is predominantly by automobile and shorter recreation trips are increasing in importance.

TAG Consensus: **A state-initiated scenic byway system plan should be developed. Elements of the plan should be eligible for funding from federal highway programs, where appropriate. The proposed byway system elements should not unduly restrict use of existing highway systems.**

A.5.8: Intercity Passenger Rail and Bus

Intercity passenger service is currently provided by Amtrak and private intercity bus companies. They provide increased capacity in congested corridors as well as reliable all weather service, reduce rural isolation and provide alternative mobility for transit-dependent people.

Amtrak, which is experiencing increased ridership and revenues, continues to receive operating support as well as funds for capital improvements in its basic rail service.

Private intercity bus operators have embarked on a program to provide improved connections and coordination with rural and local transit services.

In addition, several states are developing high speed intercity passenger rail projects in high density corridors to relieve traffic congestion and to reduce demand for expanded air system capacity.

Outstanding policy issues include the extent to which these services should be integrated into a national system and the form that integration might take in such areas as funding, regulation, and promotion.

TAG Consensus: **Limited general fund support should be provided for basic national rail network routes connecting major cities and regions where current or prospective passenger levels justify the investment and where continuation serves the national interest.**

Urban, suburban and rural public transportation connections with intercity bus service should be supported to reduce rural isolation, to offer alternative service, and to serve transit dependents.

Federal, state and local governments should support and encourage public/private partnerships to develop state-of-the-art high speed intercity service in select high density corridors where revenues are sufficient to cover most capital and operating costs and

where private capital and management is capable of financing and developing such systems.

A.5.9: Research, Development and Technology Transfer

Extremely low investment in research and development in transportation has restrained improvements in performance and productivity and contributed to a decline in the nation's technological leadership.

A wide range of technologies could be combined in both evolutionary and revolutionary approaches to developing an "intelligent vehicle/highway system." "Smart" systems for transportation system management, driver information, freight and fleet control, and vehicle automation incorporate currently available communications technology, computers, electronic displays, warning and navigation systems, and vehicle controls to improve transportation performance, safety, and reliability. Other technologies related to highway and transit materials and construction methods are also available for further research and development.

Reversing the long-standing downward trend in research within a new surface transportation program introduces questions of priorities among objectives and between short and long-term payoffs, as well as appropriate institutional roles and funding levels.

TAG Consensus: **A focussed and coordinated public-private research and development effort should be undertaken, targeted on a new generation of vehicle and guideway technology including materials, design, propulsion/fuels, operations, controls, and driver information systems.**

The widespread application of the best available technology as well as planning and management practices should be supported through an expansion of training and technology transfer activities on a cooperative federal, state, and local basis.

B. INTERGOVERNMENTAL ROLES AND RESPONSIBILITIES

Identifying appropriate intergovernmental relationships and roles in decisionmaking and resource allocation is as important as structural change in the programs themselves. TAG consensus includes the need to increase the discretion of states and local governments through program simplification and consolidation, and to enhance the roles of local government and the private sector in planning, financing, and decisionmaking. Key issues relate to the degree of flexibility that should be embodied in future programs, how decisionmaking responsibilities may be shared, and how resources are allocated.

B.1: DECISION-MAKING: LEVEL, STYLE, AND PROCESS

The allocation of most federal-aid transportation funds directly to states or transit authorities and the organization of the programs around categorical systems has the effect of reinforcing federal priorities. However, it also limits the flexibility of state and local officials to implement cost-effective solutions required to attain more broadly defined objectives such as congestion reduction, economic development, and environmental improvement.

Restructuring the federal-aid program offers the opportunity to consider striking a new balance among the federal, state, and local partners in the decisionmaking process through modifications in the existing intergovernmental planning and programming process in both metropolitan and rural contexts.

TAG Consensus: The new surface transportation program should provide for greater state and local flexibility in planning and programming decisions. The role of local government should be enhanced through a more effective intergovernmental multimodal process in metropolitan and rural areas.

B.2: FUNDING ALLOCATION AND RECIPIENTS

Under the current federal-aid process, highway-related funds are apportioned by formula to states on a functional systems or program basis for statewide application. Federal-aid Urban Systems funds are earmarked for urbanized areas over 200,000 population (with limited transferability within the state). Bridge funds are allocated on both a formula and discretionary basis to states. Urban transit funds are distributed directly to transit agencies, local governments or state agencies, depending on the "designated recipient" established pursuant to federal law. States administer the rural transit funds.

Any consolidation of the federal-aid programs brings with it difficult issues. These include formula versus discretionary apportionments for both highways and transit, and whether such funds should be allocated directly to states, earmarked for expenditure in metropolitan and rural regions, or go directly to local government or regional agency recipients.

<u>TAG Consensus</u>: Funds for federal-aid highway programs should be allocated and apportioned to states. Within states, federal funds for state and local programs should be further distributed by states and appropriate local officials in cooperation with each other.

Federal funds for public transit to support existing systems, services, and programs should continue to be provided directly to designated recipients. Federal transit funds for rural and small urban areas should continue to be provided to and through the states.

C. INVESTMENT LEVEL AND SOURCES

Achievement of national goals and program objectives is dependent to a large extent on the level of overall investment as well as the relative shares of each level of government and the private sector. TAG has agreed that an increase in the current overall national level of capital investment in surface transportation is required to respond to the backlog of unmet needs and to meet future demand.

C.1: LEVEL OF FEDERAL INVESTMENT AND STATE/LOCAL MATCHING

TAG **Basic Directions** expresses the consensus commitment to strengthening the current federal-aid funding system, broadening potential revenue sources, and increasing overall levels of investment.

Key issues remain regarding the level and timing for these increases. In addition, consideration must be given to the appropriate relative shares and sources for federal versus state/local investment and the private sector to achieve the required investment level and maintain the desirable federal role in the surface transportation program.

TAG Consensus: TAG members recognize a serious shortfall in the funding available for preserving and expanding the nation's transportation system. A substantial increase in the combined level of capital investment shared by all levels of government and the private sector is required if the transportation system is to support economic growth into the next century.

In this funding partnership the federal government must renew its commitment to a strong transportation program in support of the nation's economic health and prosperity.

In the short run, an initial increase in investment should be achieved by spending the federal user fee revenues accrued to the Highway Trust Fund for the purposes for which they are intended rather than maintaining them in the Fund to mask the true magnitude of the federal budget deficit. Until surface transportation legislation is enacted, the balances in the Trust Fund should be spent to their authorized levels. The new act should provide for drawing down the balances in a responsible incremental fashion.

The Highway Trust Fund exemption for gasohol should be eliminated and the development of alternative fuels should be supported by means that do not negatively affect highway revenues. Provision should also be made through tax incentives and programmatic means for utilization of a wider range of funding sources — private as well as public — at the state and local level.

Over the long term, federal transportation user fees and other sources of funding should be reviewed and adjusted, as necessary, to assure that the national investment in transportation facilities and services is sufficient to support the nation's goals for economic growth.

APPENDIX A

TRANSPORTATION ALTERNATIVES GROUP

HUNT VALLEY CONSENSUS WORKSHOP

ATTENDEES

October 13-14, 1989

AAA

John Archer	Managing Director, Government Affairs	
John Haifley	Director, Federal Relations	

AASHTO

James P. Pitz	Past President	Director, Michigan DOT
Kermit Justice	President	Secretary, Delaware DOT
Charles L. Miller	Chair, Task Force on Consensus Transportation Program	Director, Arizona DOT
Francis B. Francois	Executive Director	
David Clawson	Program Director	
Billy Higgins	Director, Government Affairs	

APTA

Alan Kiepper	Vice Chairman	APTA
Lou Gambaccini	Transit 2000 Task Force	General Manager SEPTA, Philadelphia, PA
Jack Gilstrap	Executive Vice President	
Bob Stanley	Deputy Executive Director	

APWA

Chester Funnye	1988-89 President	Commissioner of Public Works, Atlanta, GA
Thomas Tidemanson	Member of Board Chair, Transportation Policy Task Force	Director of Public Works Los Angeles County, CA
Kent Lande	Chair, Rural Transportation Committee	Director of Public Works McPherson County, KS
Steve Pudloski	Associate Executive Director	
Carol Everett	Director, Special Projects	

ATA

Chester Stranczek	Vice Chairman	Mayor, Crestwood, IL Chairman, Cresco Lines
Robert Farris	Vice President, Policy	
John Reith	Director, Highway Policy	
Peter Koltnow	Counselor to President	
Clyde Woodle	Executive Director, TRI	

HUFSAM

Thomas Cole	Chair, Policy Committee Member, Executive Committee	President, Rubber Manufacturers Assn.
Les Lamm	President	
Carlton Robinson	Executive Vice President	
Brenda Davis	Administrative Assistant	

NACo

Bart Barker	Chair, Transportation Steering Committee	County Commissioner Salt Lake County, UT
John Horsley	Member, Transportation Steering Committee	Chair, County Commission Kitsap County, WA
Kathleen Braaten	Second Vice President	County Commissioner Richland County, ND
Robert Fogel	Legislative Representative	

NARC

Ted Hackworth	Past President Chair, Transportation Task Force	City Councilman Denver, CO
Sandra Glenn	Member Board of Directors Member, Transportation Task Force	County Commissioner Seminole County, FL
Larry Dahms	Member, Transportation Task Force	Executive Director, Metropolitan Transportation Commission, Oakland, CA
Dick Hartman	Executive Director	
Janet Oakley	Manager, Government Affairs	
John Bosley	Legal Counsel	

NCSL

Walter Perry Jr.	Chair, Transporation and Communications Committee	State Representative, AL
William Pound	Executive Director	
Becky Brady	Committee Director	

NGA

Ray Scheppach	Executive Director	
Charilyn Cowan	Group Director, Capital Resources	

NLC

Jim Beall	Member, Transportation and Communications Steering Committee Chair, 2020 Task Force	Councilmember San Jose, CA
Verna Clayton	Member, Transportation and Communications Steering Committee	Mayor, Buffalo Grove, IL
Pete Mager	Member, Transportation and Communications Steering Committee Member, Small City Advisory Committee	Alderman, Annapolis, MD
Nick Yaksich	Policy Analyst	
Leslie Wollack	Legislative Counsel	

USCM

Peggy Rubach	Chair, Subcommittee on Public Transportation	Mayor, Mesa, AZ
Dave Karp	Chair, Subcommittee on Urban Highways	Mayor, San Leandro, CA
Judith Burrell	Assistant Executive Director	

TAG

Tom Bradshaw	Chairman	Vice President, The First Boston Corp.
Steve Lockwood	Executive Director (until 12/89)	
Don Knight	Communications Consultant	

APPENDIX B

BASIC DIRECTIONS

For a New National Surface Transportation Program

This TAG **Basic Directions** report has been organized with three related categories covering: the substantive goals and objectives of programs; the required investment levels and potential funding sources; and the implied roles of various levels of government. While there is an emphasis in redefining an appropriate federal role, **Basic Directions** is oriented to all participants in an intergovernmental process as well as the private sector.

The order of presentation is not meant to imply prioritization

GENERAL PROGRAM ORIENTATION

This category includes basic directions related to the objectives and functions of specific transportation programs and investments in response to current and emerging problems and opportunities.

Mobility

Subject to test of cost-effectiveness and environmental compatibility, improve overall mobility through:

- ☐ Provision of new highway capacity in congested and developing urban and suburban areas.
- ☐ Expansion of high capacity transit services in major urban, regional, and intercity corridors together with new high occupancy and shared-ride services in appropriate suburban and urban markets.
- ☐ Modifying the existing interstate transportation system as necessary to preserve and enhance service levels including such actions as traffic management measures and development of metropolitan by-passes based on a coordinated regional and inter-regional plan.
- ☐ Preservation of, and improvements in rural transportation for goods and people including the local roadway system, local public transportation services and linkages with intercity public transportation.

System Effectiveness and Modal Mix
